VERIFICATION PROBLEM NO 13 -- PAGE NO.
V. AISC ASD - Design of Steel Beam with Web Opening

Design the web reinforcement for a web opening in a steel beam.

Details

Note: The design at locations where openings are not present is not shown in this example.

Design Method: ASD
Beam No: 5
Beam Section: W21X50
\[ d = 20.83 \text{ in} \]
\[ t_w = 0.38 \text{ in} \]
\[ b_f = 6.53 \text{ in} \]
\[ t_f = 0.535 \text{ in} \]
\[ Z = 110 \text{ in}^3 \]
\[ L = 10 \text{ ft} \]

Weld Properties: E90XX
\[ F_y, \text{weld} = 90 \text{ ksi} \]
\[ \text{Weld Stress} = 54 \text{ ksi} \]

Opening Type: Rectangular
Number of openings: 1

Section location of Opening: 0.6
\[ a_0 = 20 \text{ in} \]
\[ h_0 = 10 \text{ in} \]
\[ e = 0 \text{ in (concentric opening)} \]
\[ F_y = 36 \text{ ksi} \]

Capacity check at web hole assuming an unreinforced opening:

Loading:
\[ V_u = 34.46 \text{ kip} \]
\[ M_u = 2,510.7 \text{ kip-inch} \]

Tee Properties:
\[ s_t = 5.415 \text{ in} \]
\[ s_b = 5.415 \text{ in} \]

*Validation*

Check for local buckling of compression flange:
width to thickness ratio \( F_1 = \frac{b_f}{2t_f} = 6.1028 \)

limiting ratio \( = \frac{65}{\sqrt{F_y}} = 86.667 > F_1 \) Hence O.K

Check for web buckling:
width to thickness ratio of web \( W_1 = \frac{(d - 2t_f)}{t_w} = 52 \)

limiting ratio \( = \frac{520}{\sqrt{F_y}} = 86.667 > W_1 \) Hence O.K

Check for opening dimensions to prevent web buckling:
Since $W_1 \leq \frac{420}{\sqrt{F_y}} = 70$, $a_0 / h_0 = 2 < 3.0$

$h_0 / d = 0.4801 < 0.7$

Opening parameter $p_0 = \frac{a_0}{h_0} + \frac{6h_0}{d} = 4.8805 < 5.6$ Hence OK

Check for Tee dimension:

$$s_t = \frac{d}{2} - \left(\frac{h_0}{2} + e\right) = 5.415\text{ in.} \geq 0.15d = 3.1245\text{ in.}$$

$$s_b = \frac{d}{2} - \left(\frac{h_0}{2} - e\right) = 5.415\text{ in.} \geq 0.15d = 3.1245\text{ in.}$$

Aspect Ratio:

$$\nu_t = \frac{a_0}{s_t} = 3.6934 < 12.0,$$

$$\nu_b = \frac{a_0}{s_b} = 3.6934 < 12.0$$ Hence OK

Calculation of Maximum Moment Capacity:

For unperforated section $M_p = F_yZ = 3,960\text{ kip-inch}$

$$\Delta A_{s} = h_0t_w = 3.8\text{ in}^2$$

$$M_m = M_p \left[1 - \frac{\Delta A_s (h_0 / 4 + e)}{Z}\right] = 3,618\text{ kip-in} \leq M_p$$ Hence OK

Calculation of Maximum Shear Capacity

$$V_{pb} = \frac{F_y t_w s_b}{\sqrt{3}} = 42.768\text{kips}$$

$$V_{pt} = \frac{F_y t_w s_t}{\sqrt{3}} = 42.768\text{kips}$$

For unreinforced opening:

$\mu_b = 0$, $\mu_t = 0$

Ratio of nominal shear capacity of tees:

$$\alpha_{vb} = \frac{\sqrt{3} + \mu_b}{v_b + \sqrt{3}} = 0.4515 \leq 1.0$$

$$\alpha_{vt} = \frac{\sqrt{3} + \mu_t}{v_t + \sqrt{3}} = 0.4515 \leq 1.0$$

Hence OK

$$V_{mb} = V_{pb} \alpha_{vb} = 19.309\text{kips}$$
\[ V_{mb} = V_{pb} \alpha_{vb} = 19.309 \text{ kips} \]

\[ V_m = V_{mb} + V_{mb} = 38.618 \text{ kips} \] Hence OK

Check against Maximum Shear capacity:
\[ V_p = \frac{F_y t_w d}{\sqrt{3}} = 164.52 \text{kips} \]

Since \( W_1 \leq \frac{420}{\sqrt{F_y}} \), \( V_m \leq \frac{2}{3} V_p = 109.68 \text{kips} \) Hence OK

Check against Moment Shear Interaction:
\[ R_1 = \frac{V_u}{\phi V_m} = 0.8923 \leq 1.0 \]
\[ R_2 = \frac{M_u}{\phi M_m} = 0.6939 \leq 1.0 \]
\[ R = \sqrt[3]{R_1^2 + R_2^3} = 1.0147 > 1.0 \]

Not OK... Try with a Reinforced web opening.

Capacity check at web hole assuming a reinforced opening:

Reinforcement should be selected to reduce R to 1.0

Let us assume,

- Thickness of Reinforcement \( t_r = 0.1875 \text{ in} \)
- Width of Reinforcement \( b_r = 0.25 \text{ in} \)

Check for local buckling of compression flange:

width to thickness ratio of web reinforcement \( F_2 = \frac{b_r}{t_r} = 1.3333 \)

limiting ratio \( = \frac{65}{\sqrt{F_y}} = 10.833 > F_2 \) Hence O.K

Area of Reinforcement \( A_r = t_r b_r = 0.0469 \text{ in}^2 \)

Calculation of Maximum Moment Capacity:
For unperforated section \( M_p = F_y Z = 3,960 \text{ kip-inch} \)
\[ \Delta A_s = h_0 t_w \cdot 2A_r = 3.7063 \text{ in}^2 \]

Since \( t_w e = 0 < A_r \)
\[ M_m = M_p \left[ 1 - \frac{t_w \left( \frac{h_0^2}{4} + h_0 e^2 - e^2 \right) - A_r h_0}{Z} \right] = 3, 634.88 \text{kip-in} \leq M_p \) Hence OK

Calculation of Maximum Shear Capacity:
\[ V_{pb} = \frac{F_y t_w s_b}{\sqrt{3}} = 42.768 \text{kips} \]
$V_{pt} = \frac{F_{yt} \cdot a_0}{\sqrt{3}} = 42.768 \text{kips}$

$s_{t1} = s - \frac{A_r}{2b_f} = 5.4114 \text{in}$

$s_{b1} = s_b - \frac{A_r}{2b_f} = 5.4114 \text{in}$

$P_r = F_y A_r = 1.6875 \leq \frac{F_y t_w a_0}{\sqrt{3}} = 78.982 \text{kips}$ Hence Ok

$d_{rt} = s_t - \frac{1}{2} t_r = 5.3213$

$d_{rb} = s_b - \frac{1}{2} t_r = 5.3213$

$v_t = \frac{a_0}{s_1} = 3.6959 < 12.0, \mu_t = \frac{2P_r d_{rt}}{V_{mt} t} = 0.0775$

$v_b = \frac{a_0}{s_{b1}} = 3.6959 < 12.0, \mu_b = \frac{2P_r d_{rb}}{V_{mb} t} = 0.0775$

$\alpha_{vb} = \frac{\sqrt{E} + \mu_b}{v_b + \sqrt{3}} = 0.4656 \leq 1.0$

$\alpha_{vt} = \frac{\sqrt{E} + \mu_t}{v_t + \sqrt{3}} = 0.4656 \leq 1.0$

Hence OK

$V_{mb} = V_{pb} \alpha_{vb} = 19.911 \text{kips}$

$V_{mt} = V_{pt} \alpha_{vt} = 19.911 \text{kips}$

$V_m = V_{mb} + V_{mt} = 39.823 \text{kips}$

Check against Maximum Shear capacity :

$V_p = \frac{F_y t_w d}{\sqrt{3}} = 164.52 \text{kips}$

Since $W_1 \leq \frac{420}{\sqrt{F_y}}, V_m \leq \frac{2}{3} V_p = 109.68 \text{kips}$ Hence OK

Check against Moment Shear Interaction :

$R_1 = \frac{V_u}{\phi V_m} = 0.8653 \leq 1.0$

$R_2 = \frac{M_u}{\phi M_m} = 0.6907 \leq 1.0$

$R = \frac{3}{2} R_1^3 + R_2^3 = 0.9924 < 1.0$ Hence OK

Calculation of length of Fillet Weld :

$A_f = b_f t_f = 3.4936 \text{ in}^2$
For reinforcing bars on one side of the web:

\[ A_r \leq \frac{A_f}{3} = 1.1645\text{in}^2 \text{ Hence OK} \]

\[ a_0 / h_0 = 2 \leq 2.5 \text{ Hence OK} \]

\[ V_1 = \frac{s_t}{t_w} = 14.25, \quad V_2 = \frac{s_b}{t_w} = 14.25 \]

\[ V_1 \text{ and } V_2 \leq \frac{140}{\sqrt{F_y}} = 23.333\text{kips} \text{ Hence OK} \]

\[ \frac{M_u}{V_{ud}} = 3.4977 \leq 2 \text{ Hence OK} \]

\[ R_{w1} = \phi 2P_r = 3.375\text{kips} \text{ (strength of weld within the length of the opening)} \]

\[ L_1 = \max \left( \frac{a_0}{4}, \frac{A_r \sqrt{3}}{2t_w} \right) = 5\text{in} \text{ (length extended on each side of the opening)} \]

Thus, Length of bar = \( a_0 + 2L_1 = 30\text{in} \)

\[ R_{w2} = \phi F_y A_r = 1.6875\text{kips} \text{ (strength of weld for extension on each side of opening)} \]

Strength of Weld \( R_{w} = \max(R_{w1}, R_{w2}) = 3.375 \text{kips} \)

Fillet Weld Size = 0.0044 in (rounded to nearest weld size of 0.0625 in = 1/16 in)

Corner Radii:

Minimum Radii = \( \max(2t_w, \frac{5}{7}) = 0.76\text{in} \)

- D1.B.3 Design of Beams with Web Openings (on page 1151)

**V. AISC ASD - Deflection Check for a Steel Beam with Web Opening**

Determine the deflection of a beam with a web opening.

*Details*

- Design Method : ASD
- Beam No : 5
Beam Section : W21X50

\[ d = 20.83 \text{ in} \]
\[ t_w = 0.38 \text{ in} \]
\[ b_f = 6.53 \text{ in} \]
\[ t_f = 0.535 \text{ in} \]
\[ Z = 110 \text{ in}^3 \]
\[ L = 30 \text{ ft} \]
\[ E = 29,732 \text{ ksi} \]

Opening Type: Rectangular

Number of openings : 1

Section location of Opening, \( s_{open} = 0.3 \)
\[ a_0 = 20 \text{ in} \]
\[ h_0 = 10 \text{ in} \]
\[ e = 0 \text{ in (concentric opening)} \]
\[ F_y = 36 \text{ ksi} \]

Loading at critical location:
\[ V_u = 9.51 \text{ kip} \]
\[ M_u = 344.36 \text{ kip-inch} \]

Location of maximum deflection from start of the member : \( L_{critical} = 120 \text{ in} \)

Tee Properties:

\[ s_t = 5.415 \text{ in} \]
\[ s_b = 5.415 \text{ in} \]
\[ \text{Moment Area} = \frac{b_f t_f^2}{2} + t_w \left( s_t - t_f \right) \left( \frac{s_t t_f}{2} + t_f \right) = 6.4514 \text{ in}^3 \]
\[ \text{Area} = b_f t_f + t_w (s_t - t_f) = 5.34795 \text{ in}^2 \]
\[ C_{yt} = \text{Moment Area} / \text{Area} = 1.20632 \text{ in.} \]
\[ I_{zz,t} = I_{zz,b} = \frac{b_f t_f^3}{2} + b_f t_f \left( C_y - \frac{t_f}{2} \right)^2 + \frac{t_w (s_t - t_f)^3}{12} + t_w \left( s_t - t_f \right) \left( c_y - t_f - \frac{s_t - t_f}{2} \right)^2 = 12.644 \text{ in}^3 \]

(concentric opening)
\[ I_{zz} = I_{zz,t} + I_{zz,b} = 25.2872 \text{ in}^3 \]

Validation

\[ R_t = \frac{I_{zz,b}}{I_{xx}} = 0.5 \]
\[ R_b = \frac{I_{zz,t}}{I_{xx}} = 0.5 \]
\[ V_t = F_y R_t = 4.755 \]
\[ V_b = F_y R_b = 4.755 \]
\[ \Delta_{0l} = \frac{V_a^3}{6EI_{zz,t}} = 0.01686 \text{in} \]
\[ \Delta_{0b} = \frac{V_b^3}{6EI_{zz,b}} = 0.01686 \text{in} \]
\[ \Delta_0 = \Delta_{0b} + \Delta_{0b} = 0.03373 \text{in} \]

\[ L_0 = \text{distance from high moment end of opening to adjacent support} = L - s_{\text{open}} - \frac{a_0}{2} = 314 \text{in} \]

\[ L_2 = \text{distance from support to the point where deflection is maximum} = L_0 \cdot \frac{L}{L_{\text{critical}}} = 240 \text{ in} \]

\[ L_3 = L_0 \cdot L_2 = 74 \text{ in} \]

\[ \Delta_{p1} = \Delta_0 \frac{L_2}{L_0} = 0.02578 \text{in} \]

\[ \theta_H = \frac{\Delta_0}{L_0} = 0.00011 \]

\[ \theta_T = \frac{V_a}{4EI_{zz}} = 0.00126 \]

\[ \Delta_{p2} = \frac{2L_2L_3(\theta_H + \theta_T)}{L_0 + L_2} = 0.08799 \]

\[ \Delta = \Delta_{p1} + \Delta_{p2} = 0.11377 \text{ in} \text{ (extra deflection due to opening)} \]

Displacement factor: \[ \Delta_{\text{factor}} = 750 \]

\[ \Delta_{\text{allow}} = \frac{L}{\Delta_{\text{factor}}} = 0.48 \text{in} \]

Ratio of \[ \Delta_{\text{actual}}/\Delta_{\text{allow}} = 0.66 \text{ (without web opening)} \]

Thus, \[ \Delta_{\text{actual}} = 0.3168 \text{ in} \text{ (from analysis considering stiffness of unperforated member without web opening)} \]

Total deflection considering the effect of web hole,

\[ \Delta_{\text{actual,wb}} = \Delta + \Delta_{\text{actual}} = 0.4306 \text{ in} \]

\[ \text{Ratio} = \frac{\Delta_{\text{actual,wb}}}{\Delta_{\text{allow}}} = 0.897 \]

Results

</tbody>
</table>
* STAAD.Pro does not directly report the deflection, but rather the ratio of deflection with length, $dff$, for comparison with a limiting displacement factor.

\[
\Delta_{\text{actual,wb}} = \frac{L}{dff} = \frac{360 \text{ in}}{834.32} = 0.4315 \text{ in}
\]

**Note:** The member length used for deflection calculations is defined using the start deflection joint number, DJ1, and end deflection joint number, DJ2. These are assigned to the member in the design code parameters. STAAD.Pro uses this to calculate the physical member length rather than the segment length of the analytical member for deflection checks.

V. AISC LRFD - Wide Flange Tension Capacity

To check the adequacy of a W8X24 American section to carry a tensile design load of 245 Kips.

Reference

Hand calculation using the following reference:

Related Links

• D1.C.5 Limit States (on page 1159)

Problem

Assume the reduction in area due to bolt holes to be equivalent to a net section factor of 0.72.

\[ F_y = 50 \text{ ksi} \]
\[ L = 10 \text{ ft} \]

Hand Calculation

Net section = \(0.72(7.08 \text{ in.}^2) = 5.11 \text{ in.}^2\)

\[ \phi \frac{P}{n} = \begin{cases} \phi t F_y A_e = 0.9(50 \text{ksi})(7.08 \text{in.}^2) = 318.6k \\ \phi t F_u A_e = 0.75(65 \text{ksi})(5.11 \text{in.}^2) = 248.5k \end{cases} \]

Comparison

The reported STAAD.Pro value is based on the term PNT in the STAAD.Pro output.

Table 778: Comparison of results

MEMBER PROPERTY AMERICAN
V. AISC LRFD - Wide Flange Flexural Strength 1

To determine the design flexural strength of an ASTM A992 W18X40 bent about its strong axis on a 35-ft span with a uniformly distributed load.

Reference

Hand calculation using the following reference:

_AISC Load Factor Resistance Design_, 3rd Edition, Example 5.1, Case (a), page 5-12.

Related Links

- _D1.C.5 Limit States_ (on page 1159)
**Details**

The beam is braced such that $L_b = 2$ ft. The deflection at mid-span due to a uniformly distributed service load of 1 kip/ft is also to be calculated.

- $F_y = 50$ ksi
- Length = 35 ft

**Validation**

The beam is continuously braced, so by observation $L_b < L_p$.

The design flexural strength is:

$$\phi_b M_n = \phi_b [F_y Z_x] = 0.9 \times [50 \text{ ksi} \times 78.4 \text{ in}^3] = 3,528 \text{ k·in}$$

The maximum deflection (at midspan) due to a uniform load of 1 kip/ft is:

$$\Delta = \frac{5wL^4}{384EI} = \frac{5(1)(35)^4(12)^3}{384(29,000)(612)} = 1.90 \text{ in.}$$

**Results**

V. AISC LRFD - Wide Flange Flexural Strength 2

To determine the design flexural strength of an ASTM A992 W18X40 bent about its strong axis on a 35-ft span with a uniformly distributed load.

Reference

Hand calculation using the following reference:

Related Links

• D1.C.5 Limit States (on page 1159)

Details

The beam is braced at the ends and at third points such that \( L_b = 140 \text{ in} \).

\[ F_y = 50 \text{ ksi} \]

Length = 35 ft

Validation

The plastic limiting unbraced length is given by:

\[
L_p = 1.76r_y \sqrt{\frac{E}{F_y}} = 1.76 \left(1.27\right) \sqrt{\frac{29,000}{50}} = 53.8 \text{ in.}
\]

The inelastic limiting unbraced length is given by:

\[
L_r = \frac{r_y X_1}{F_L} \sqrt{1 + 1 + X_2 F_L^{-2}} \quad (F1-6)
\]

where

\[ F_L = \frac{F}{F_r} = \frac{F_{mf}}{F_r} = \frac{50 \text{ ksi}}{10 \text{ ksi}} = 40 \text{ ksi} \]
\[ X_1 = \frac{n}{S_x} \sqrt{\frac{E G J A}{2}} = \frac{n}{68.4} \sqrt{\frac{29,000(11,200)(0.810)(11.85)}{2}} = 1,813 \]

\[ X_2 = 4 \frac{C_w}{T_y} \left( \frac{S_x}{G J} \right)^2 = 4 \left( \frac{1.440}{19.1} \right) \left( \frac{68.4}{11,200(0.810)} \right)^2 = 0.0171 \]

\[ L_r = \frac{1.27 \times 1,813}{40} \sqrt{1 + \sqrt{1 + 0.0171(40)^2}} = 144.9 \text{ in.} \]

\[ M_r = F_1 S_x = 40 \times 68.4 = 2,736 \text{ in·k} \quad \text{(F1-7)} \]

\[ L_p = 53.8 \text{ in.} \]

\[ L_r = 144.9 \text{ in.} \]

\( L_p < L_b < L_r \); thus, the section is inelastic.

The nominal flexural strength is:

\[ M_n = C_b \left( M_p - \left( M_p - M_r \right) \frac{L_b - L_p}{L_r - L_p} \right) < M_p \quad \text{(F1-2)} \]

\[ M_p = F_y Z_x = 50 \times 78.4 = 3,920 \text{ in·k} \]

Conservatively assume \( C_b = 1.0 \).

\[ M_n = 3,920 - \left( 3,920 - 2,736 \right) \left( \frac{140 - 53.8}{144.9 - 53.8} \right) = 2,800 \text{ in·k} \]

The lateral-torsional buckling limit state capacity:

\[ \phi_b M_n = 0.9 \times (2,800) = 2,520 \text{ in·k} \]

User Manual
V. AISC LRFD - Wide Flange Flexural Strength 3

To determine the design flexural strength of an ASTM A992 W18X40 bent about its strong axis on a 35-ft span with a uniformly distributed load.

Reference
Hand calculation using the following reference:

AISC Load Factor Resistance Design, 3rd Edition, Example 5.1, Case (c), page 5-12.

Related Links
- D1.C.5 Limit States (on page 1159)

Details
The beam is braced at the ends only and so, \( L_b = 420 \text{ in.} \)

- \( F_y = 50 \text{ ksi} \)
- Length = 35 ft

Validation
The inelastic limiting unbraced length is given by:
\[ L_r = \frac{r_y X_1}{F_L} \sqrt{1 + \sqrt{1 + X_2 F_L^2}} \]  

where

\[ F_L = F_y - F_r = 50 \text{ ksi} - 10 \text{ ksi} = 40 \text{ ksi} \]

\[ X_1 = \frac{\pi S_x E}{A_2} = \frac{\pi}{68.4} \left( \frac{29,000(11,200)(0.810)(11.85)}{2} \right) = 1,813 \]

\[ X_2 = 4 \left( \frac{C_w}{S_y f_y} \right)^2 = 4 \left( \frac{1.440}{19.1} \right)^2 \left( \frac{68.4}{11,200(0.810)} \right)^2 = 0.0171 \]

\[ L_r = \frac{1.27 \times 1,813}{40} \sqrt{1 + \sqrt{1 + 0.0171(40)^2}} = 144.9 \text{ in.} \]

\[ L_b > L_r \text{, thus the section is subject to elastic lateral-torsional buckling.} \]

The modification factor, \( C_b \), is given by:

\[ C_b = \frac{12.5 M_{\text{max}}}{2.5 M_{\text{max}} + 3 M_A + 4 M_B + 3 M_C} \]  

Since the moment diagram is symmetric about the mid-span point of the beam, the maximum moment is the same as the mid-span moment and the quarter-point moments are equal:

\[ M_{\text{max}} = M_B = \frac{w l^2}{8} \]

The quarter-point moments of a uniformly loaded beam are likewise equal:

\[ M_A = M_C = \frac{w(l/4)^2}{2} \left( l - \frac{l}{4} \right) = \frac{3w l^2}{32} \]

The \( w l^2 \) terms factor out and the constants simply as follows:

\[ C_b = \frac{12.5 \frac{(1/8)}{2} \left( \frac{6.5(1/8)}{6.5(1/8) + 6(3/32)} \right)}{2.5 \left( \frac{6.5(1/8)}{6.5(1/8) + 6(3/32)} \right)} = \frac{12.5(1/8)}{6.5(1/8) + 6(3/32)} = 1.14 \]

The critical buckling moment is given by:

\[ M_{cr} = \frac{C_b S_x X_1 \sqrt{2}}{L_b / r_y} \sqrt{1 + \frac{X_1^2 X_2}{2(L_b / r_y)^2}} \]  

\[ M_{cr} = \frac{1.14(68.4)(1,813) \sqrt{2}}{420 / 1.27} \sqrt{1 + \frac{(1,813)^2(0.0171)}{2(420 / 1.27)^2}} = 675.6 \text{ in·k} \]

The lateral-torsional buckling limit state capacity:

\[ \phi_b M_n = 0.9 \times (675.6) = 608.1 \text{ in·k} \]

--- End of STAAD Output ---
V. AISC LRFD - Non Compact Wide Flange 1

To check the adequacy of a non-compact fully braced W shape to carry a uniformly distributed load of 5.5 kips/ft.

Reference

Related Links

- D1.C.5 Limit States (on page 1159)

Details

W14x90 shape. Beam is bent about its strong axis.

\[ F_y = 50 \text{ ksi} \]

Length = 30 ft

Validation

Check flange slenderness:
\[ \lambda_p = 0.38 \sqrt{\frac{E}{F_y}} = 0.38 \sqrt{\frac{29,000}{50}} = 9.152 < \frac{b}{2f} = 10.2 \]

\[ F_L = 50 \text{ ksi} - 10 \text{ ksi} = 40 \text{ ksi} \]

\[ \lambda_r = 0.83 \sqrt{\frac{E}{F_L}} = 0.83 \sqrt{\frac{29,000}{40}} = 22.35 > \frac{b}{2f} = 10.2 \]

\[ M_c = F_L S_x = 40 \times 143 = 5,720 \text{ in} \cdot \text{k} \]

Flanges are non-compact. The nominal moment capacity for the limit state of flange local buckling is:

\[
M_n = M_p - (M_p - M_r) \left( \frac{\lambda - \lambda_p}{\lambda_r - \lambda_p} \right) \quad \text{(A-F1-3)}
\]

\[
M_p = F_y Z_x = 50 \times 157 = 7,850 \text{ in} \cdot \text{k}
\]

\[
M_n = 7,850 - (7,850 - 5,720) \left( \frac{10.2 - 9.152}{22.35 - 9.152} \right) = 7,681 \text{ in} \cdot \text{k}
\]

**Note:** As the flanges are fully braced, lateral-torsional buckling does not govern the capacity.

The flange local buckling limit state capacity:

\[ \phi_b M_n = 0.9 \times (7,681) = 6,913 \text{ in} \cdot \text{k} \]

The ultimate moment is:

\[ M_u = \frac{w_u l^2}{8} = \frac{5.5(30)^2}{8} = 7,425 \text{ in} \cdot \text{k} \]

The capacity ratio is: \( \frac{7,425}{6,913} = 1.074 \)

Related Links

- *D1.C.5 Limit States* (on page 1159)

Details

C12x25 shape. Beam is bent about its strong axis.
Fy = 36 ksi
Length = 20 ft

Validation
The beam is continuously braced, so by observation \(L_b < L_p\).
The yielding limit state capacity in bending:
\[\phi_b M_n = \phi_b [F_y Z_x] = 0.9 \times [36 \text{ ksi} \times 29.4 \text{ in}^3] = 952.6 \text{ k in}\]
The ultimate moment is:
\[M_u = \frac{w u l^2}{8} = \frac{1.5(12)^2}{8} = 75 \text{ k-ft} = 900 \text{ k-in}\]
The capacity ratio is: \(900 / 952.6 = 0.945\)

Verification Examples

STAAD.Pro V.09 Steel Design

STAAD.Pro User Manual
V. AISC LRFD - MC Shape Capacity

To check the adequacy of a fully braced MC shape to carry a uniformly distributed ultimate load of 1.34 kips/ft.

Reference

Related Links

• *D1.C.5 Limit States* (on page 1159)

Details

MC10x41.1 shape. Beam is bent about its strong axis.

\[ F_y = 36 \text{ ksi} \]

\[ \text{Length} = 25 \text{ ft} \]

Validation

The beam is continuously braced, so by observation \( L_b < L_p \).

The yielding limit state capacity in bending:

\[ \phi_b M_n = \phi_b [F_y Z_x] = 0.90 \times [36 \text{ ksi} \times 39.3 \text{ in}^2] = 1,273 \text{ k in} \]

The ultimate moment is:
\[ M_u = \frac{w_u l^2}{8} = \frac{1.34(25)^2 \cdot 12}{8} = 1256 \text{ k-in} \]

The capacity ratio is: \(1256 / 1273 = 0.987\)

V. AISC LRFD - Non Compact Wide Flange 2

To determine the design bending strength of a non-compact American wide flange section bent about its strong axis. The deflection at mid-span due to two 10 kip concentrated loads acting at the third points along the beam is also to be calculated.

Reference

Related Links

- *D1.C.5 Limit States* (on page 1159)

Details

W21x48 shape

- $F_y = 50$ ksi
- Length = 40 ft
- $L_b = 60$ in.

Validation

Evaluate section for lateral-torsional buckling:

The plastic limiting unbraced length is given by:

$$L_p = 1.76r_y\sqrt{\frac{F}{F_y}} = 1.76\left(\frac{29,000}{50}\right) = 70.4\text{ in.}$$

$L_b < L_p$, thus, the member is plastic.

Check flange slenderness:

$$\lambda_p = 0.38\sqrt{\frac{E}{F_y}} = 0.38\sqrt{\frac{29,000}{50}} = 9.152 < \frac{b}{2t_f} = 9.47$$

$F_L = 50$ ksi - 10 ksi = 40 ksi
\[ \lambda_r = 0.83\sqrt{\frac{E}{F_L}} = 0.83\sqrt{\frac{29,000}{40}} = 22.35 > \frac{b}{2t_f} = 9.47 \]

Flanges are non-compact. The nominal moment capacity for the limit state of flange local buckling is:

\[ M_n = M_p \cdot \left( \frac{\lambda - \lambda_p}{\lambda_r - \lambda_p} \right) \quad (A-F1-3) \]

\[ M_p = F_y Z_x = 50 \times 107 = 5,350 \text{ in·k} \]

\[ M_n = 5,350 \cdot \left( 5,350 - 3,720 \right) \left( \frac{9.47 - 9.152}{22.35 - 9.152} \right) = 5,311 \text{ in·k} \]

The flange local buckling limit state capacity:

\[ \phi_b M_n = 0.9 \times (5,311) = 4,780 \text{ in·k} \]

The ultimate moment is:

\[ M_u = P_u \left( \frac{l}{3} \right) = 10 \left( \frac{30 \times 12}{3} \right) = 1,600 \text{ in·k} \]

The capacity ratio is: \( 1,600 / 4,780 = 0.335 \)

The deflection at mid-span for a beam loaded at third points:

\[ \Delta_{\text{max}} = \frac{P l^3}{28 E I} = \frac{10 \times (40 \times 12)^3}{2 \times 29,000 \times 959} = 1.42 \text{ in.} \]

V. AISC LRFD - Non Compact Wide Flange 3

To determine the design bending strength of a non-compact American wide flange section bent about its strong axis.

Reference

Related Links

- *D1.C.5 Limit States* (on page 1159)

Problem

W21x48 shape

\[ F_y = 50 \text{ ksi} \]

Length = 40 ft

\[ L_b = 160 \text{ in.} \]

Validation

The plastic limiting unbraced length is given by:

\[ L_p = 1.76r_y \sqrt{F_y} = 1.76(1.66)\sqrt{29,000} = 70.4 \text{ in.} \]

The inelastic limiting unbraced length is given by:
where

\[ F_L = F_{Lf} - F_r = 50 \text{ ksi} - 10 \text{ ksi} = 40 \text{ ksi} \]

\[ X_1 = \frac{\pi}{S_x} \left( \frac{E}{GJ} \right) = \frac{\pi}{93.0} \left( \frac{29,000(11,200)(0.803)(14.17)}{2} \right) = 1,449 \]

\[ X_2 = 4 \left( \frac{S_y}{T_y} \right)^2 = 4 \left( \frac{8,950}{38.7} \right) \left( \frac{93.0}{11,200(0.803)} \right)^2 = 0.0437 \]

\[ L_r = \frac{1.66 \times 1,449}{40} \sqrt{1 + \sqrt{1 + 0.0437(40)^2}} = 184.6 \text{ in.} \]

\( L_p < L_b < L_i \); thus, the section is inelastic.

The nominal flexural strength is:

\[ M_n = C_b \left[ M_p - \left( M_p - M_r \right) \left( \frac{L_b - L_p}{L_r - L_p} \right) \right] < M_p \]

\[ M_p = F_L S_x = 40 \times 93.0 = 3,720 \text{ in·k} \] (F1-7)

Conservatively assume \( C_b = 1.0 \) (this is the default behavior in STAAD.Pro when the parameter is not directly specified).

\[ M_n = 5,350 \times 3,720 \left( \frac{160 \times 70.4}{184.6 \times 70.4} \right) = 4,071 \text{ in·k} \]

The lateral-torsional buckling limit state capacity:

\[ \phi_b M_n = 0.9 \times 4,071 = 3,664 \text{ in·k} \]

**Comparison**

The reported STAAD.Pro value is based on the term MNZ in the STAAD.Pro output.

V. AISC LRFD - Wide Flange Compression Capacity 4

To determine the design bending strength of a non-compact American wide flange section bent about its strong axis.

Reference

Related Links

- *D1.C.5 Limit States* (on page 1159)

Details

W21x48 shape

\[ F_y = 50 \text{ ksi} \]

Length = 40 ft

\[ L_b = 480 \text{ in. (braced at end points only)} \]

Validation

The inelastic limiting unbraced length is given by:

\[ L_r = \frac{r_y X_1}{F_L} \sqrt{1 + \sqrt{1 + X_2 F_L^2}} \]  

(F1-6)

where

\[ F_L = \frac{F_y f - F_r}{F_L} = \frac{50 \text{ ksi} - 10 \text{ ksi}}{40 \text{ ksi}} = 1,449 \]

\[ X_1 = \frac{\pi S_x E G J}{F_y G J} \]

\[ X_2 = \frac{C_w S_x}{F_y G J} \]

\[ L_r = \frac{1.66 \times 1,449}{40} \sqrt{1 + \sqrt{1 + 0.0437(40)^2}} = 184.6 \text{ in.} \]

\[ L_b > L_r \text{, thus the section is subject to elastic lateral-torsional buckling.} \]

The modification factor, \( C_b \), is given by:

\[ C_b = \frac{12.5 M_{max}}{2.5 M_{max} + 3 M_A + 4 M_B + 3 M_C} \]  

(F1-3)

Since the moment diagram is symmetric about the mid-span point of the beam, the maximum moment is the same as the mid-span moment and the quarter-point moments are equal.

\[ M_{max} = M_B = \frac{w l^2}{8} \]

The quarter-point moments of a uniformly loaded beam are likewise equal:

\[ M_A = M_C = \frac{w(l/4)^2}{2} \left(1 \cdot \frac{1}{4}\right) = \frac{3w l^2}{32} \]

The \( w l^2 \) terms factor out and the constants simply as follows:
The critical buckling moment is given by:

\[ M_{cr} = \frac{C_b S x_1 \sqrt{2}}{L_b/r_y} \sqrt{1 + \frac{X_1^2 X_2}{2(L_b/r_y)^2}} \]  

The lateral-torsional buckling limit state capacity:

\[ \phi_b M_n = 0.9 \times (935.0) = 841.5 \text{ in·k} \]

---

**V. AISC LRFD - Select Wide Flange 2**

To find the optimum W shape with a flexural design strength of 150 ft-kips. Beam is braced at ends and at mid-span point.

**Reference**

**Related Links**

- *D1.C.5 Limit States* (on page 1159)

**Details**

The beam should also satisfy a deflection limit of 1.0 inches under service load.

- \( F_y = 50 \text{ ksi} \)
- Length = 20 ft
- \( L_b = 10 \text{ ft} \)

Service load of 2.0 kip/ft. Deflection limit under service load = 1.0 in.

**Validation**

From the chart on p.4-160 of the *Manual of Steel Construction*, the most efficient wide-flange section to resist 150 kip-ft of moment with an unbraced length of 10 ft is a W16x31. From this same chart, the design bending strength can be taken as 150 kip-ft (the curve crosses at approximately the same point as the demand load).
The deflection limit under service conditions can be met by determining the minimum required moment of inertia needed.

\[
1 \text{ in.} = \frac{5(2.0 \text{ kips})(20 \text{ ft})^4(12 \text{ in./ft})^3}{384(29,000 \text{ ksi})^2}
\]

Solving for the minimum \( I = 248 \text{ in.}^4 \). A W16x31 has an \( I_x = 375 \text{ in.}^4 \), so it will have less deflection than the limit under service conditions.

**Results**

V. AISC LRFD - Load Capacity of 3 Wide Flange Beams

To find the design flexural strength capacity of 3 beams of different spans using the data in Table 5-4 of AISC LRFD 3rd edition.

Reference

Related Links
- *D1.C.5 Limit States* (on page 1159)

Details

W21x62 section.

\[ F_y = 50 \text{ ksi} \]

40 ft, 30 ft, and 8 ft spans are investigated. All beams are fully braced.

Validation

Bending Capacity

The beam is fully braced so it can reach full plastic capacity:

\[ \phi M_n = 0.9 \times 50 \times 144 = 6,480 \text{ in-k} \]

The total load capacity on the beam is then calculated by setting the ultimate capacity equal to the load, \( \phi M_n = M_u = W \times l / 8 \) and then solving for the total load:

\[ W_1 = 8(\phi M_n / l) = 8 \left( \frac{6,480}{40 \times 12} \right) = 108 \text{ kips} \]

\[ W_2 = 8(\phi M_n / l) = 8 \left( \frac{6,480}{30 \times 12} \right) = 144 \text{ kips} \]

Shear Capacity

Check for web slenderness:

\[ \frac{h}{t_w} = 46.9 < 2.45\sqrt{F_y/E} = 2.45\sqrt{29,000/50} = 59.0 \]

The nominal shear capacity of a W21x62 section:

\[ V_n = 0.6 F_{yw} A_w = 0.6 \times 50 \times 0.4 \times 21.0 = 252 \text{ kips} \]

\[ \phi V_n = 0.9 \times 252 = 226.8 \text{ kips} \]

The total load capacity on the beam is then calculated by setting the ultimate capacity equal to the load, \( \phi V_n = V_u = W / 2 \) and then solving for the total load:

\[ W_3 = 2(\phi V_n) = 2(226.8) = 453.6 \text{ kips} \]

This governs the total load capacity for the short span (8') case.

Using the total weight values from the reference, the following distributed loads are calculated:
### Table 798: Comparison of results

<td>226.8</td>
<td>none</td>
</tr>
<tr>
<td>Utilization ratio</td>
<td>1.0</td>
<td>1.001</td>
<td>negligible</td>
<td></td>
</tr>
</tbody>
</table>

### Results

There is no direct comparison of the results from STAAD.Pro with the Reference, as the program does not directly compute the total member load. However, when the total member load is applied as a distributed load (see previous table), the Utilization ratio will then nominally be unity (1.0) for a beam loaded at its capacity.

### STAAD Input

The file C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC LRFD - Load Capacity of 3 Wide Flange Beams.STD is typically installed with the program.

**Note:** The UNT parameter is set to 1.0 in. in order to approximate a fully-braced condition.

V. AISC LRFD - Compression and Biaxial Bending

To check the adequacy of an ASTM A992 W14X176 beam subject to axial compression and biaxial bending.
**Verification Examples**

**V.09 Steel Design**

---

**Reference**

**Related Links**

- *D1.C.5 Limit States* (on page 1159)

**Problem**

W14x176 section.

- \( F_y = 50 \text{ ksi} \)
- \( P_u = 1,400 \text{ kips} \)
- \( M_{uy} = 70 \text{ ft-kips}, M_{uz} = 200 \text{ ft-kips} \)
- \( L_b = 14 \text{ ft} \)

Reverse curvature bending with equal end moments for both axis.

**Hand Calculations**

According to page 16.1 - 97 of the LRFD 3rd ed. code,

\[
M_p = F_y \cdot Z \leq 1.5 F_y \cdot S
\]

For a W14x176,

\[
0.9 (1.5 F_y \cdot S) = 0.9 \times [1.5(50)(107)] = 7,222 \text{ kip-in} = 601.8 \text{ kip-ft},
\]

which is lower than \((0.9 F_y \cdot Z) = 611\). Hence, STAAD.Pro uses this limit state.

**Comparison**

The reported STAAD.Pro value is based on the terms \( \text{PNC}, \text{MNY}, \text{and MNZ} \) in the STAAD.Pro output.

**Table 800: Comparison of results**

**V. AISC N690 1994 Angle**

Verify the allowable stress and critical ratio of the brace members in a frame using the AISC N690 1994 code.
**Details**

The horizontal load is 7.5 kips and the vertical load is 10 kips.

![Figure 498: Space frame subjected to static loads](image)

The forces due to loading in member 6 is 2.861 kips (tension) and in member 7 is 7.328 kips (compression).

Members 6 and 7 are “truss” members (axial-only).

Both member 6 and 7 are L 80x60x10, austenitic stainless steel ($F_y = 36$ ksi, $F_u = 58$ ksi).

Assume a net section factor of 0.9 and an effective length factor of 0.85.

**Validation**

$$L = \sqrt{5^2 + 6^2} \text{(12in/ft)} = 93.726\text{in}$$

Slenderness ratio (same for both members) using the minimum value of $r$: $kL/r_z = 0.85(93.726)/1.29 = 61.76$

For member 6, $kL/r_z = 61.76 < 300$

For member 7, $kL/r_z = 61.76 < 200$

For members in compression (member 7), the equivalent slenderness ratio per Eqn. 4-4 of AISC ASD p5-311 must also be determined:

$$(KL/r)_{equiv} = \pi \times \sqrt{E/F_e}$$

where

$$F_e = \text{the elastic buckling strength for flexural torsional buckling taken to be 60.348 ksi. This is defined as the lowest root of the Eqn in AISC ASD (C4-2) page 5-317}$$

Thus, $$(KL/r)_{equiv} = \pi \times \sqrt{29,000 / 60.348} = 68.86$$

Axial Tension: Member 6
Actual tensile stress (gross) = \( P/A = 2.862 / 8.41 = 0.340 \text{ ksi} \)
Allowable tensile stress (Tension capacity) = \( 0.6 \times F_y = 0.6 \times 36 = 21.6 \text{ ksi} \)
Critical ratio = \( 0.340/21.6 = 0.016 \)

**Axial Compression: Member 7**

Actual compressive stress = \( P/A = 7.328 / 8.41 = 0.871 \text{ ksi} \)

As this member is made from austenitic stainless steel the allowable compression stress should be determined according to clause Q.1.5.9. As \( KL/r < 120 \), then the value of allowable axial stress, \( F_a \), is determined from Eqn. Q1.5-11:

\[
F_a = \frac{F_y}{2.15} \cdot \left( \frac{F_y}{2.15} \cdot \frac{6}{120} \right) \times KL \left| r = 16.74 \cdot \left( \frac{16.71 \cdot 6}{120} \right) \right| 68.86 = 10.57 \text{ ksi}
\]

Check cross-section meets requirements of Q1.9, which sets a limit for any unstiffened element clause Q1.9.1.2 of \( \frac{75}{\sqrt{F_y}} = 12.67 \)

Short leg = \( B/t = 6/0.625 = 9.5 < 12.67 \), OK
Long leg = \( D/t = 8/0.625 = 12.8 > 12.67 \), leg is slender

Since \( \frac{75}{\sqrt{F_y}} = 12.67 < D/t = 12.8 < 155/\sqrt{F_y} = 25.83 \), \( Q_s \) is determined by Eqn. QC2-1:

\[
Q_s = 1.340 - 0.00447 \times (b/t) \times \sqrt{F_y} = 0.9967
\]

Allowable compressive stress, \( F_a = 0.9967 \times 10.57 = 10.54 \text{ ksi} \)
Critical ratio = \( 0.871 / 10.54 = 0.083 \)

**Results**

**Verification Examples**

V.09 Steel Design

STAAD.Pro User Manual
V. AISC N690 1994 Channel

Verify the design of channel section used for a beam member using the AISC N690 1994 code.

**Details**

The beam is a propped cantilever 80 inches long. The beam is loaded with a 2 kip concentrated load at midspan and a uniformly distributed load of 1 kip/in over the entire length.

The member is C15x50 channel section with Grade A36 steel.

**Validation**

Maximum shear force (at fixed end): $V = 51.375$ kips (taken from STAAD.Pro analysis)

Maximum moment (at fixed end): $M = 830.0$ in-kip (taken from STAAD.Pro analysis)

**Slenderness Ratio**

About z-axis: $(KL/r)_z = 0.85(80 \text{ in})/(5.25 \text{ in}) = 12.95$

About y-axis: $(KL/r)_y = 0.85(80 \text{ in})/(0.865 \text{ in}) = 78.61$

Max. slenderness ratio < 300, OK.

**Bending About Major Axis (Z Axis)**

$$\frac{b_f}{t_f} = 4.62 < \frac{65}{\sqrt{F_y}} = 10.83$$

The laterally unsupported length of the compression flange, $L_b = 80 < \frac{76b_f}{\sqrt{F_y}} = 120$

and $< \frac{20,000}{(d/A_f)F_y} = 89.56$

As $b_f/t_f$ is not in the range of $65/\sqrt{(F_y)}$ and $95/\sqrt{(F_y)}$, the value of allowable bending compressive and tensile stress $= F_{bty} = F_{bcy} = 0.6 \times F_y = 21.6 \text{ ksi}$

Actual bending stress:

Bending Tensile Stress = bending compressive stress $= f_{btz} = f_{bcz} = \frac{MzD}{(2I_z)} = 15.4 \text{ ksi}$

$$830.0 \times (15.0) / (2 \times 404) = 15.41 \text{ ksi}$$
Critical ratio = 15.41 ksi / 21.6 ksi = 0.713

Shear

Actual shear:

$$F_y = 51.375 \text{ kips}$$

STAAD.Pro calculates the shear are based on the general shear stress equation, \( \tau = V \times Q / (I \times t) \) from Timoshenko. Thus the shear area, \( A_y = I \times t / Q = 8.47 \text{ in}^2 \)

$$f_v = 51.375 / 8.47 = 6.07 \text{ ksi}$$

Allowable shear:

a = clear distance between transverse stiffeners (here taken as length) = 80 in

h = clear distance flanges of the girder = \( D - 2t_f = 14.35 \text{ in} \)

Thus, \( a/h = 5.57 \), Therefore, \( k = 5.34 + [4.00 / (a/h)]^2 = 5.46 \)

\( t = t_w = 0.72 \text{ in} \)

If

$$C_v = 17.2$$

$$F_v = \min \left( \frac{F_y}{2.89 \times C_v} = 25.6 \text{ ksi} \right) \quad 0.4 \times F_y = 14.4 \text{ ksi}$$

Hence allowable=14.4 ksi

Therefore, Ratio = \( f_v / F_v = 6.07 / 14.4 = 0.422 \)

Results

V. AISC N690 1994 Pipe Section With SLC

Verify the design of a pipe section used for a beam member per the AISC N690 1994 code.

References

Details
The 10 ft long span is a propped cantilever which is free to move axially at the fixed end. The beam is subject to the following four different load cases:

1. a 10 kip axial tension force,
2. a 10 kip axial compression force,
3. a uniformly distributed load of 0.3 kip/ft in the Global Y directions, the member selfweight (acts in Global Y), and the tension load from case 1
4. a uniformly distributed load of 0.3 kip/ft in the Global Y directions, the member selfweight (acts in Global Y), and the compression load from case 2

The member is Pipe 5-Sched. 40 (standard) pipe section with Grade A36 steel. The self-weight is 14.6 lbs/ft.

Validation
Slenderness Ratio
The slenderness ratio is the same about either local z or y axes: \(KL/r = 120 \text{ in} / 1.888 \text{ in} = 63.56 < 300\), OK

Axial Tension
From section Q1.5.1.1, the allowable tensile stress:

\[
F_t = \min \left\{ \frac{0.6F_y}{A}, \frac{0.5F_u}{A} \right\} = \min \left\{ \frac{0.6 \times 36}{A}, \frac{0.5 \times 58}{A} \right\} = \min \{21.6, 29\} = 21.6 \text{ ksi}
\]

The actual tensile stress from load case 1:

\[
f_t = \frac{P}{A} = \frac{10}{4.01} = 2.49 \text{ ksi} < F_t
\]

Stress ratio = 2.49 / 21.6 = 0.115, hence OK.

Axial Compression
Allowable compressive stress per Cl Q1.9.2.3:

\[
\frac{\text{OD}}{t} = \frac{5.56}{0.24} = 23.17 < \frac{3300}{36} = 91.67
\]
\[ C_c = \sqrt{\frac{2a^2E}{F_y}} = 126.1 \]

Since \( K_l/r < C_c \) per eq. Q1.5-1, the allowable axial compressive stress:

\[
F_a = \frac{\left(\frac{K_l}{r}\right)^2}{1 - 2 \times C_c^2} \times \frac{F_y}{5 + 3 \times \frac{K_l}{r} \times \left(\frac{K_l}{r}\right)^3} = 17.08 \text{ ksi} 
\]

The actual compressive stress from load case 2:

\[ f_a = \frac{P}{A} = \frac{10}{4.01} = 2.49 \text{ ksi} < F_a \]

Stress ratio = \( 2.49 / 17.08 = 0.146 \), hence OK.

**Bending**

Section is compact per Cl Q1.5.1.4.1: \( \frac{OD}{t} = 23.17 < \frac{3,300}{F_y} = 91.67 \)

Allowable bending stress about both axes: \( F_b = 0.66 \times F_y = 23.76 \text{ ksi} \)

Moment due to load case 3 or 4 on a propped cantilever (ref. AISC Steel Construction Manual):

\[ M_z = \frac{w \times l^2}{8} = \frac{0.314 \times 10^2}{8} = 3.93 \text{ ft} \cdot \text{k} = 47.2 \text{ in} \cdot \text{k} \]

Actual bending stress about the major axis:

\[ f_{bz} = \frac{M_z}{I_z} \left(\frac{OD}{2}\right) = \frac{47.2}{14.3} \left(\frac{5.56}{2}\right) = 9.17 \text{ ksi} \]

(actual bending about the minor axis: \( f_{by} = 0 \))

Stress ratio: \( 9.17 / 23.76 = 0.386 \), hence OK.

**Combined Bending and Axial Tension**

Interaction per Cl Q1.6.2 in load case 3 (tension + bending):

\[ \frac{f_a}{SFT \times 0.6F_y} + \frac{f_{bz}}{SMZ \times F_{bz}} = \frac{2.49}{1.3 \times 21.6} + \frac{9.17}{1.4 \times 23.76} = 0.364 \] (Eq. Q1.6-1b)

**Combined Bending and Axial Compression**

Interaction per Cl Q1.6 in load case 4 (compression + bending):

\[ \frac{f_a}{SFC \times F_a} = 0.145 < 0.15 \] (Eq. Q1.6-2)

\[ \frac{f_a}{SFC \times F_a} + \frac{f_{by}}{SHT \times F_{by}} + \frac{f_{bz}}{SMZ \times F_{bz}} = \frac{2.49}{1.3 \times 17.08} + \frac{0}{1.4 \times 23.76} + \frac{9.17}{1.4 \times 23.76} = 0.388 \]

**Shear**

Actual shear (at supports):

\[ f_{v,y} = \frac{5w \times l}{8} = \frac{5 \times 0.315 \times 10}{8} = 1.97 \text{ kip} \]
Shear area (calculated as per Gere & Timoshenko reference):

\[ A_z = \frac{\pi}{4} \left( r_2^2 - r_1^2 \right) \times \frac{2(r_2 - r_1)}{3(r_2^3 - r_1^3)} \]

where

- \( r_1 \) = the inner radius of the pipe = \( \frac{5.56}{2} \cdot 0.24 = 2.54 \) in
- \( r_2 \) = the outer radius of the pipe = \( \frac{5.56}{2} = 2.78 \) in

Thus, the shear area along both axes = \( 2.008 \) in\(^2\).

\[ F_{vy} = \frac{F_{v,y}}{A_y} = \frac{1.97}{2.008} = 0.98 \text{ ksi} \]

(shear stress in major axis = 0)

The allowable shear stress:

\[ F_v = 0.4F_y = 14.4 \text{ ksi} \]

Stress ratio in Y (minor axis): \( 0.98/14.4 = 0.068 \), hence OK.

**Results**

**VERIFICATION EXAMPLES**

**STAAD.Pro**

**5802**

**User Manual**
V. AISC N690 1994 Pipe

Verify the design of a pipe section used for a beam member per the AISC N690 1994 code.

Details

The simply supported beam is 50 inches long. The beam is loaded with a 1.5 kip concentrated load at midspan and a uniformly distributed load of 1 kip/in over the entire length.

The member is PIPS 120 pipe section with Grade A36 steel.

Validation

Maximum shear force, \( V = \frac{P}{2} + \frac{wL}{2} = \frac{1.5}{2} + \frac{1.0(50)}{2} = 25.75 \text{kips} \)

Maximum moment, \( M = \frac{PL}{4} + \frac{wL^2}{8} = \frac{1.5(50)}{4} + \frac{1.0(50)^2}{8} = 331.25 \text{in} \cdot \text{kip} \)

Slenderness ratio = \((KL/r) = 9.72 < 300\)

Bending About Major Axis (Z-Axis)

Section is compact: \( \frac{OD}{t} = 36.43 < \frac{2}{3} \cdot 300 = 91.67 \)

Allowable bending stress: \( F_b = 0.66 \times F_y = 23.76 \text{ksi} \)

Actual bending stress: \( f_{btz} = f_{bcz} = \frac{M_z}{I_z} \left( \frac{OD}{t^2} \right) = \frac{331.25}{262} \left( \frac{12.75}{2} \right) = 8.06 \text{ksi} \)

Stress ratio: 0.339

Shear

From the reference, the shear area:

\[
A_y = \frac{0.25n[r_2^4 - r_1^4]2(r_2 - r_1)}{2\left(r_2^3 - r_1^3\right)}
\]

where

\( r_1 \) = inner radius
\( r_2 \) = outer radius

Shear area: \( A_y = 6.8 \text{ in}^2 \)

Actual shear stress (at supports): \( f_v = 25.75 / 6.8 = 3.78 \text{ ksi} \)

Actual shear stress (at midspan): \( f_v = 0.75 / 6.8 = 0.110 \text{ ksi} \)

Allowable shear stress, \( F_v = 0.4 \times F_y = 14.4 \text{ ksi} \)

Stress ratio: 3.78/14.4 = 0.263

Verification Examples
V.09 Steel Design

Related Links

V. AISC N690 1994 W Shaped

Verify the design of a wide-flange section used for a cantilever beam using the AISC N690 1994 code.

Details
The beam is a 10 ft cantilever with a 12.5 kip concentrated load at the free end. The member is a W16X40 section with Grade A36 steel.

Validation
Maximum shear force (constant shear): \( V = 12.5 \text{ kips} \)
Maximum moment (at fixed end): \( M = 12.5 \text{ kips} \times 120 \text{ in} = 1,500 \text{ in-kips} \)

Slenderness Ratio
\((KL/r)_z = \text{Slenderness Ratio along Z-Axis} = 18.11\)
\((KL/r)_y = \text{Slenderness Ratio along Y-Axis} = 76.68\)
Maximum Slenderness Ratio = 76.68 < 240 (Hence OK)

Bending
Allowable Bending Stress About Major Axis (Z Axis)

\[ b'tz = 6.862 < 65/\sqrt{F_y} \]
Thus, allowable bending tensile stress = \( F_{btz} = 0.66 \times 23.76 \text{ ksi} \)
Actual bending stress About Major Axis
\[ f_{btz} = \frac{M_z D}{2z} = 23.2 \text{ ksi} \]

Stress ratio = \( \frac{23.2 \text{ ksi}}{23.76 \text{ ksi}} = 0.975 \)

**Shear**

Allowable Shear Stress

\( a = \text{clear distance between transverse stiffeners (here taken as length)} = 120 \text{ inch} \)

\( h = \text{clear distance flanges of the girder} = D - 2t_f = 14.91 \text{ inch} \)

Thus, \( \frac{a}{h} = 8.05 \), Therefore, \( k = 5.34 + \frac{4.00}{(a/h)^2} = 5.36 \)

\( t = t_w = 0.3 \text{ inch} \)

\( C_v = 1.475 \)

\[ F_v = \left( \frac{F_y}{2.89} \right) C_v \geq 0.4 \times F_y = 14.4 \text{ ksi} \]

Hence allowable = 14.4 ksi

**Actual Shear Stress**

STAAD.Pro calculates the shear area based on the general shear stress equation, \( \tau = \frac{V \times Q}{I \times t} \) from Timoshenko. Thus the shear area, \( A_y = \frac{I \times t}{Q} = 4.401 \text{ in}^2 \)

\[ f_v = \frac{F_y}{A_y} = \frac{12.5 \text{ kip}}{4.401} = 2.84 \text{ ksi} \]

Stress ratio = \( \frac{f_v}{F_v} = 0.18 \)

**Related Links**

**V. AISC N690 1984 Angle**

Verify the allowable stress and critical ratio of the brace members in a frame using the AISC N690 1984 code.

**Details**

The forces due to loading in member 6 is 2,666.18 lbs (tension) and in member 7 is 7,104.23 lbs (compression). Members 6 and 7 are "truss" members (axial-only).
Both member 6 and 7 are L 80x60x10, grade A36 steel ($F_y = 36$ ksi, $F_u = 58$ ksi).
Assume a net section factor of 0.9, an effective length factor of 0.85, and $C_t = 0.9$.

**Validation**

$$L = \sqrt{5^2 + 6^2} \text{(12in/ft)} = 93.726 \text{in}$$

Slenderness ratio (same for both members) using the minimum value of $r$: $kL/r_z = 0.85(93.726)/1.29 = 61.76$

For member 6, $kL/r_z = 61.76 < 300$
For member 7, $kL/r_z = 61.76 < 200$

**Axial Tension: Member 6**
Corrected area, $A_c = C_t \times A_x = 7.57 \text{ in}^2$
Actual tensile stress $= P/A = 2,666.18 / 7.57 = 352.2 \text{ psi}$
Allowable tensile stress (Tension capacity) $= 0.6 \times F_y = 0.6 \times 36 = 21.6 \text{ ksi}$
Critical ratio $= 352.2 / 21600 = 0.016$

**Axial Compression: Member 7**
Actual compressive stress $= P/A = 7,104.23 / 8.41 = 844.74 \text{ psi}$

$$C_c' = \sqrt{\frac{2n E}{Q_y Q_a F_y}} = 126.2$$

$(kL/r)\min < C_c'$, allowable compression stress, $F_a = 17.2 \text{ ksi}$
Critical ratio $= 844.74 / 17,200 = 0.049$

Related Links
- **D1.K.2. ANSI/AISC N690-1984 Code** (on page 1296)
V. AISC N690 1984 Channel

Verify the design of channel section used for a beam member using the AISC N690 1984 code.

Details

The beam is a propped cantilever 80 inches long. The beam is loaded with a 2 kip concentrated load at midspan and a uniformly distributed load of 1 kip/in over the entire length.

The member is C15x50 channel section with Grade A36 steel.

Validation

Maximum shear force (at fixed end): \( V = 51.375 \) kips (taken from STAAD.Pro analysis)

Maximum moment (at fixed end): \( M = 830.0 \) in-kip (taken from STAAD.Pro analysis)

Slenderness Ratio

About z-axis: \( (KL/r)_z = 0.85(80 \text{ in})/(5.25 \text{ in}) = 12.95 \)

About y-axis: \( (KL/r)_y = 0.85(80 \text{ in})/(0.865 \text{ in}) = 78.61 \)

Max. slenderness ratio < 300, OK.

Bending About Major Axis (Z Axis)

\[
\frac{b_f}{t_f} = 4.62 < \frac{65}{\sqrt{F_y}} = 10.83
\]

The laterally unsupported length of the compression flange, \( L_b = 80 < \frac{76b_f}{\sqrt{F_y}} = 120 \)

and \( < \frac{20000}{(d/A_f)\sqrt{F_y}} = 89.56 \)

As \( b_f/t_f \) is not in the range of \( 65/\sqrt{F_y} \) and \( 95/\sqrt{F_y} \), the value of allowable bending compressive and tensile stress = \( F_{bty} = F_{bcy} = 0.6\times F_y = 21.6 \text{ ksi} \)

Actual bending stress:

Bending Tensile Stress = bending compressive stress = \( f_{btz} = f_{bcz} = \frac{MzD}{(2I_z)} = 15.4 \text{ ksi} \)

830.0 (15.0) / (2 \times 404) = 15.41 ksi

Critical ratio = 15.41 ksi / 21.6 ksi = 0.713

Shear

Actual shear:

\( F_y = 51.375 \) kips

\( V_y = D \times t_w = 10.8 \text{ in}^2 \)

\( f_{v,y} = F_y/V_y = 4.76 \text{ ksi} \)

Allowable shear:

\( a = \text{clear distance between transverse stiffeners (here taken as length)} = 80 \text{ in} \)

\( h = \text{clear distance flanges of the girder} = D - 2t_f = 14.35 \text{ in} \)

Thus, \( a/h = 5.57 \), Therefore, \( k = 5.34 + [4.00/ (a/h)^2] = 5.46 \)
\[ t = t_w = 0.72 \text{ inch} \]
\[ C_v = 17.2 \]
\[ F_v = \left( \frac{F_y}{2.89} \right) C_v \geq 0.4 \times F_y = 14.4 \text{ ksi} \]

Hence allowable = 14.4 ksi
Therefore, Ratio = \( \frac{f_v}{F_v} = 0.330 \)

## Verification Examples

### V. AISC N690 1984 Pipe Section With SLC

Verify the design of a pipe section used for a beam member per the AISC N690 1984 code.

### References

Details

The 10 ft long span is a propped cantilever which is free to move axially at the fixed end. The beam is subject to the following four different load cases:

1. a 10 kip axial tension force,
2. a 10 kip axial compression force,
3. a uniformly distributed load of 0.3 kip/ft in the Global Y and Z directions, the member selfweight (acts in Global Y), and the tension load from case 1
4. a uniformly distributed load of 0.3 kip/ft in the Global Y and Z directions, the member selfweight (acts in Global Y), and the compression load from case 2

The member is Pipe 5-Sched.40 (standard) pipe section with Grade A36 steel. The self-weight is 14.6 lbs/ft.

Validation

Slenderness Ratio

The slenderness ratio is the same about either local z or y axes: \( KL/r = 120 \text{ in} / 1.888 \text{ in} = 63.56 < 300 \), OK

Axial Tension

From section Q1.5.1.1, the allowable tensile stress:

\[
F_t = \min \left\{ 0.6 F_y = 0.6 \times 36 = 21.6 \text{ ksi} \right. \\
0.5 F_u = 0.5 \times 58 = 29 \text{ ksi} 
\]

The actual tensile stress from load case 1:

\[
f_t = \frac{P}{A} = \frac{10}{4.01} = 2.49 \text{ ksi} < F_t
\]

Stress ratio = 2.49 / 21.6 = 0.115, hence OK.

Axial Compression

Allowable compressive stress per Cl Q1.9.2.3:

\[
\frac{OD}{t} = \frac{5.56}{0.24} = 23.17 < \frac{3.300}{36} = \frac{3.300}{F_y} = 91.67
\]

\[
C_c = \sqrt{\frac{2\pi E}{F_y}} = 126.1
\]

Since \( KL/r < C_c \) per eq. Q1.5-1, the allowable axial compressive stress:

\[
F_a = \frac{1}{2} \cdot \frac{\left(\frac{KL}{r}\right)^2}{2 \times C_c^2} F_y = \frac{17.08}{36} \text{ ksi}
\]

The actual compressive stress from load case 2:
\[ f_a = \frac{P}{A} = \frac{10}{4.01} = 2.49 \text{ ksi} < F_a \]

Stress ratio = \(2.49 / 17.08 = 0.146\), hence OK.

Bending

Section is compact per Cl Q1.5.1.4.1: \(\frac{OD}{t} = 23.17 < \frac{3.300}{F_y} = 91.67\)

Allowable bending stress about both axes: \(F_b = 0.66 \times F_y = 23.76 \text{ ksi}\)

Moment due to load case 3 or 4 on a propped cantilever (ref. AISC Steel Construction Manual):

\[ M_z = \frac{w \times l^2}{8} = \frac{0.314 \times 10^2}{8} = 3.93 \text{ ft} \cdot \text{k} = 47.2 \text{ in} \cdot \text{k} \]
\[ M_y = \frac{w \times l^2}{8} = \frac{0.3 \times 10^2}{8} = 3.75 \text{ ft} \cdot \text{k} = 45 \text{ in} \cdot \text{k} \]

Actual bending stress about the major axis: \(f_{bz} = \frac{M_z}{I_z} \left(\frac{OD}{2}\right) = \frac{47.2}{14.3} \left(\frac{5.56}{2}\right) = 9.17 \text{ ksi}\)

Actual bending stress about the minor axis: \(f_{by} = \frac{M_z}{I_z} \left(\frac{OD}{2}\right) = \frac{45.0}{14.3} \left(\frac{5.56}{2}\right) = 8.75 \text{ ksi}\)

Stress ratio: \(9.17 / 23.76 = 0.386\), hence OK.

Combined Bending and Axial Tension

Interaction per Cl Q1.6.2 in load case 3 (tension + bending):

\[ \frac{f_a}{SFT \times 0.6 F_y} + \frac{f_{by}}{SMY \times F_{by}} + \frac{f_{bz}}{SMZ \times F_{bz}} = \frac{2.49}{1.3 \times 21.6} + \frac{8.75}{1.4 \times 23.76} + \frac{9.17}{1.4 \times 23.76} = 0.627 \quad (\text{Eq. Q1.6-1b}) \]

Combined Bending and Axial Compression

Interaction per Cl Q1.6 in load case 4 (compression + bending):

\[ \frac{f_a}{SFC \times F_a} + \frac{f_{by}}{SMY \times F_{by}} + \frac{f_{bz}}{SMZ \times F_{bz}} = \frac{2.49}{1.3 \times 17.08} + \frac{8.75}{1.4 \times 23.76} + \frac{9.17}{1.4 \times 23.76} = 0.651 \quad (\text{Eq. Q1.6-2}) \]

Shear

Actual shear (at supports):

\[ f_{v,y} = \frac{5w \times l}{8} = \frac{5 \times 0.315 \times 10}{8} = 1.97 \text{ kip} \]
\[ f_{v,z} = \frac{5w \times l}{8} = \frac{5 \times 0.3 \times 10}{8} = 1.88 \text{ kip} \]

Shear area (calculated as per Gere & Timoshenko reference):

\[ A_z = \frac{\pi}{4} (r_2^4 - r_1^4) \times 2(r_2 \cdot r_1) \]
\[ \frac{2}{3} (r_2^3 \cdot r_1^3) \]

where

\( r_1 \) = the inner radius of the pipe = \(5.56 / 2 \cdot 0.24 = 2.54 \text{ in}\)
\[ r_2 = \text{the outer radius of the pipe} = \frac{5.56}{2} = 2.78 \text{ in} \]

Thus, the shear area along both axes = \(2.008 \text{ in}^2\).

\[
F_{vy} = \frac{F_{v,y}}{A_y} = \frac{1.97}{2.008} = 0.98 \text{ ksi}
\]

\[
F_{vz} = \frac{F_{v,z}}{A_y} = \frac{1.88}{2.008} = 0.94 \text{ ksi}
\]

The allowable shear stress: \(F_v = 0.4F_y = 14.4 \text{ ksi}\)

Stress ratio in Y (minor axis): \(0.98/14.4 = 0.068\), hence OK.

Stress ratio in Z (major axis): \(0.94/14.4 = 0.065\), hence OK.

V. AISC N690 1984 Pipe

Verify the design of a pipe section used for a beam member per the AISC N690 1984 code.

Reference

Related Links

• D1.K.2. ANSI/AISC N690-1984 Code (on page 1296)

Details

The simply supported beam is 50 inches long. The beam is loaded with a 1.5 kip concentrated load at midspan and a uniformly distributed load of 1 kip/in over the entire length.

The member is PIPS 120 pipe section with Grade A36 steel.

Validation

Maximum shear force, \( V = \frac{P}{2} + \frac{wL}{2} = \frac{1.5}{2} + \frac{1.0(50)}{2} = 25.75 \text{kips} \) 

Maximum moment, \( M = \frac{PL}{4} + \frac{wL^2}{8} = \frac{1.5(50)}{4} + \frac{1.0(50)^2}{8} = 331.25 \text{in} \cdot \text{kip} \)

Slenderness ratio = \( \frac{KL}{r} = 9.72 < 300 \)

Bending About Major Axis (Z-Axis)

Section is compact: \( \frac{OD}{r} = 36.43 < \frac{2.300}{F_y} = 91.67 \)

Allowable bending stress: \( F_b = 0.66 \times F_y = 23.76 \text{ksi} \)

Actual bending stress: \( f_{btz} = f_{bcz} = \frac{M_z}{T_z} \left( \frac{OD}{2} \right) = \frac{331.25}{262} \left( \frac{12.75}{2} \right) = 8.06 \text{ksi} \)

Stress ratio: 0.339

Shear

From the reference, the shear area:

\[
A_y = \frac{0.25n\left(r_2^4 - r_1^4\right)2\left(r_2 - r_1\right)}{2\left(r_2^3 - r_1^3\right)}
\]

where

\[
r_1 = \text{inner radius} \\
r_2 = \text{outer radius}
\]

Shear area: \( A_y = 6.8 \text{ in}^2 \)

Actual shear stress (at supports): \( f_v = \frac{25.75}{6.8} = 3.78 \text{ksi} \)
Actual shear stress (at midspan): $f_v = 0.75 / 6.8 = 0.110 \text{ ksi}$

Allowable shear stress, $F_v = 0.4 \times F_y = 14.4 \text{ ksi}$

Stress ratio: $3.78/14.4 = 0.263$

V. AISC N690 1984 Tee
Verify the design of a pipe section used for a beam member per the AISC N690 1984 code.

Details
A cantilever beam is 60 in long. The beam is loaded at the free end with a 2 kip load and a uniform load of 1 kip/in along the entire length.
The member is a WT18x67.5 section with Grade A36 steel.

**Validation**

Maximum shear force (at support) \( V = wL + P = (1 \text{ kip/in}) \times 60 \text{ in} + 2 \text{ kip} = 62 \text{ kips} \)

Maximum moment (at support) \( M = 0.5 \times w \times L^2 + P \times L = 0.5 (1 \text{ kip/in}) \times (60 \text{ in})^2 + (2 \text{ kip}) \times (60 \text{ in}) = 1,920 \text{ in·kips} \)

**Slenderness Ratio**

Slenderness Ratio along Z-Axis \( (KL/r)_z = 21.22 \)

Slenderness Ratio along Y-Axis \( (KL/r)_y = 50.53 \)

Maximum Slenderness Ratio = 50.53 < 300

**Bending**

Allowable Bending Stress About Major Axis (Z Axis)

\[
b'\sqrt{2t_f} = 4.65 > 65/\sqrt{F_Y} = 10.833
\]

\[
d/t_w = 28.3 < 640/\sqrt{F_Y} = 106.67
\]

Thus allowable bending stress is obtained by treating the section as compact.

\[F_b = 0.66 \times F_Y = 23.8 \text{ ksi}\]

**Actual Bending Stress**

Bending Tensile Stress \( = f_{btz} = (Mz/Iz) \times Y_{bar} = 14.93 \text{ ksi} < 23.8 \text{ ksi}\)

Bending Compressive Stress \( = f_{bcz} = 38.7 \text{ ksi} > 23.8 \text{ ksi}\)

Critical stress ratio = 38.7 ksi / 23.8 ksi = 1.626

**Shear**

**Allowable Shear Stress**

\[a = \text{clear distance between transverse stiffeners (here taken as length)} = 60 \text{ in} \]

\[h = \text{clear distance flanges of the girder} = D - t_f = 17.01 \text{ in} \]

Thus, \(a/h = 3.527\) Therefore, \(k = 5.34 + [4.00/ (a/h)^2] = 5.65\)

\[t = t_w = 0.44 \text{ inch}\]

If \(Cv > 0.8\), \(Cv = [190/(h/t)]\sqrt{(k/S_y)} = 78.4\) which is true. Thus, the value of \(Cv\) is taken as 78.4

Allowable shear stress \( = F_v = (F_Y/2.89)Cv \leq 0.4F_Y = 14.4 \text{ ksi}\)

Hence allowable shear =14.4ksi

**Actual Shear**

\[V_y = D t_w = 10.68 \text{ in}^2\]

\[f_v = F_y/V_y = 5.805 \text{ ksi}\]

Stress ratio \( = f_v/F_v = 0.403\)

Allowable bending stress about minor axis, \(f_{btz} = 0.75 \times F_y = 27 \text{ ksi}\)
## Results

# Verification Examples

## V. AISC N690 1984 W Shaped

Verify the design of a wide-flange section used for a cantilever beam using the AISC N690 1984 code.

### Details

The beam is a 10 ft cantilever with a 12.5 kip concentrated load at the free end.

The member is a W16X40 section with Grade A36 steel.

### Validation

Maximum shear force (constant shear): \( V = 12.5 \text{ kips} \)

Maximum moment (at fixed end): \( M = 12.5 \text{ kips} \times 120 \text{ in} = 1,500 \text{ in-kips} \)
Slenderness Ratio

\((KL/r)_z = \text{Slenderness Ratio along Z-Axis} = 18.11\)
\((KL/r)_y = \text{Slenderness Ratio along Y-Axis} = 76.68\)

Maximum Slenderness Ratio = 76.68 < 240 (Hence OK)

Bending

Allowable Bending Stress About Major Axis (Z Axis)

\[ \frac{b_t f_t}{2t_f} = 6.862 < \frac{65}{\sqrt{F_y}} \]
Thus, allowable bending tensile stress = \(F_{btz} = 0.66 \times F_y = 23.76\) ksi

Actual bending stress About Major Axis

\[ f_{btz} = \frac{M_z D}{2 \times I_z} = 23.2\) ksi\]
Stress ratio = 23.2 ksi / 23.76 kis = 0.975

Shear

Allowable Shear Stress

\[ F_v = 0.4 \times F_y = 14.4\) ksi\]

Actual Shear Stress

\[ V_y = D \times t_w = 4.8\) in\(^2\]
\[ f_v = \frac{F_y}{V_y} = 2.6\) ksi\]
Stress ratio = \(f_v/F_v = 0.18\)

V. AISI

V. AISI 2016 Channel section

Determine the flexural strength and shear strength of a cold-formed channel section without lips according to AISI S100 2016 Specification using both LRFD and ASD methods.

Details

The member is a simply-supported, 6 ft span. The member is subject to a uniform load of 194.4 lbs/ft. The section used is a 550CU125-54.

Section Properties

Depth of section, \( d = 5.698 \text{ in} \)
Width of section, \( b = 1.25 \text{ in} \)
Thickness, \( t = 0.0566 \text{ in} \)
Fillet radius, \( r = 0.0849 \text{ in} \)
Area, \( A = 0.452 \text{ in}^2 \)
Moment of inertia major axis, \( I_{zz} = 1.9 \text{ in}^4 \)
Moment of inertia minor axis, \( I_{yy} = 0.053 \text{ in}^4 \)
Section modulus major axis, \( Z_{zz} = 0.667 \text{ in}^3 \)
Section modulus minor axis, \( Z_{yy} = 0.0512 \text{ in}^3 \)
Distance between centroid and shear center: \( x_0 = -0.539 \text{ in} \)
Radius of gyration about major axis: \( r_x = \sqrt{\frac{I_x}{A}} = 2.053 \text{ in} \)
Radius of gyration about minor axis: \( r_y = \sqrt{\frac{I_y}{A}} = 0.342 \text{ in} \)
Polar radius of gyration: \( r_0 = \sqrt{r_x^2 + r_y^2 + x_0^2} = 2.15 \text{ in} \)
Torsion constant, \( J = 0.00048 \text{ in}^4 \)

Material Properties

\( E = 29,500 \text{ ksi} \)
\( G = 11,300 \text{ ksi} \)
\( F_y = 33 \text{ ksi} \)

Design Forces

\( M_x = 10.5 \text{ ft} \cdot \text{k} \)
\( V_y = 0.583 \text{ kips} \)
Validation

Lateral-Torsional Buckling Strength

\[ \sigma_{ey} = \frac{n^2 E}{(K_y L_y/r_y)^2} = \frac{n^2 \times 29,000}{(1 \times 72/0.342)^2} = 6.586 \text{ ksi} \]

\[ \sigma_t = \frac{1}{A \times r_0^2} \times \left( G \times J + \left( \frac{n^2 E \times C_w}{(K_t L_t)^2} \right) \right) = \frac{1}{0.452(2.15)^2} \times \left( 11,300 \times 0.000483 + \frac{n^2 \times 29,000 \times 0.315}{(1 \times 72)^2} \right) = 11.12 \text{ ksi} \]

\[ C_b = 1.136 \]

For singly symmetric sections bent about the axis of symmetry:

\[ F_{cre} = \frac{C_b r_0^4 A}{S_f} \sqrt{\frac{\sigma_{ey} \sigma_t}{\sigma_y}} = \frac{1.136(2.15)(0.452)}{0.668} \sqrt{6.586 \times 11.12} = 14.15 \text{ ksi} \]

where

\[ S_f = \text{the elastic section modulus for the unreduced section relative to the extreme compression fiber per AISI S100 2016. Hence, } S_f = S_z. \]

For \( F_{cre} < 0.56F_y = 0.56 \times 33 = 18.58 \), \( F_n = F_{cre} \).

\[ M_{ne} = F_n \times S_f = 14.15 \times 0.667 = 9.433 \text{ in-k} \]

Allowable nominal lateral-torsional buckling strength (ASD):

\[ \frac{M_{ne}}{\Omega_b} = \frac{9.433}{1.67} = 5.649 \text{ in-kips} \]

Design nominal lateral-torsional buckling strength (LRFD):

\[ \phi_b M_{ne} = 0.9 \times 9.433 = 8.49 \text{ in-kips} \]

Bending About Major Axis

\[ M_y = F_y \times S_f = 33 \times 0.667 = 22.01 \text{ in-k} \]

Allowable nominal bending strength (ASD):

\[ \frac{M_y}{\Omega_b} = \frac{22.01}{1.67} = 13.18 \text{ in-kips} \]

Design nominal bending strength (LRFD):

\[ \phi_b M_y = 0.9 \times 22.01 = 19.81 \text{ in-kips} \]

Local Buckling Interaction with Yield and Global Buckling

From Section F3:

\[ S_e = 0.665 \text{ in}^3 \]

\[ M_{nl} = S_e \times F_n = 0.665 \times 14.15 = 9.412 \text{ in-k} \]

Allowable nominal bending strength (ASD):

\[ \frac{M_{nl}}{\Omega_b} = \frac{9.412}{1.67} = 5.636 \text{ in-kips} \]

Design nominal bending strength (LRFD):
\[ \phi_v M_{nl} = 0.9 \times 9.412 = 8.471 \text{ in·kips} \]

Governing strength ratio:
\[ \text{LRFD: } 10.498 / 8.471 = 1.239 \]
\[ \text{ASD: } 10.498 / 5.636 = 1.862 \]

Shear Strength along Minor Axis
\[ h = D - 2 \times (t - r) = 5.698 - 2 \times (0.0566 - 0.0849) = 5.145 \text{ in} \]
\[ h / t = 5.415 / 0.0566 = 95.67 \]
\[ A_w = h \times t = 5.415 \times 0.0566 = 0.307 \text{ in}^2 \]
\[ V_y = 0.6 \times A_w \times F_y = 0.6 \times 0.307 \times 33 = 6.069 \text{ kip} \]
\[ F_{cr} = \frac{\pi^2 \times EK_v}{12(1 - \mu^2)\left(\frac{h}{t}\right)^2} = \frac{\pi^2 \times 29,000 \times 5.34}{12(1 - 0.3^2)(95.67)^2} = 15.56 \text{ ksi} \]
\[ V_{cr} = A_w \times F_{cr} = 0.307 \times 15.56 = 4.75 \text{ kip} \]
\[ \lambda_v = \frac{V_y}{V_{cr}} = \sqrt{\frac{0.069}{4.75}} = 1.128 \]

For \(0.815 < \lambda_v \leq 1.227,\)
\[ V_n = 0.815 \sqrt{V_{cr} \times V_y} = 0.815 \sqrt{4.75 \times 6.069} = 4.384 \text{ kip} \]

Allowable nominal shear strength (ASD):
\[ \frac{V_n}{\Omega_v} = \frac{4.384}{1.60} = 2.739 \text{ kips} \]

Design nominal shear strength (LRFD):
\[ \phi_v V_n = 0.95 \times 4.384 = 4.165 \text{ kips} \]

Governing strength ratio:
\[ \text{LRFD: } 0.583 / 4.165 = 0.14 \]
\[ \text{ASD: } 0.583 / 2.74 = 0.213 \]

V. AISI 2016 CS Compressive Strength
Verify the compressive strength of a cold-formed channel section with lips per the AISI S100 2016 specification.

Details
A 10’ long, simply supported beam is subjected to a 10 kip axial load (compression). The section used is a 362CS162-54, Grade 50 steel.

Section Properties
Taken from AISI Manual, Cold-Formed Steel Design - Vol. 1, 2017 Table I-2.

Area, \( A_g = 0.422 \text{ in}^2 \)
Radius of gyration z axis, \( r_z = 1.44 \text{in} \)
Radius of gyration y axis, \( r_y = 0.605 \text{ in} \)
Distance from centroid to shear center, \( x_o = -1.28 \text{ in} \)
Elastic section modulus y axis, \( S_{fy} = 0.482 \text{ in}^3 \)
Elastic section modulus z axis, \( S_{fz} = 0.142 \text{ in}^3 \)
Torsional constant, \( J = 0.000451 \text{ in}^4 \)
Warping constant, \( C_w = 0.457 \text{ in}^6 \)

Material Properties
\( E = 29,000 \text{ ksi} \)
\( G = 11,300 \text{ ksi} \)
\( F_y = 50 \text{ ksi} \)

Validation
The elastic flexural buckling stress about the z axis:

\[
F_{crez} = \frac{n^2E}{(K_zL_z/r_z)^2} = \frac{n^2 \times 29,000}{(1 \times 120 / 1.44)^2} = 41.22 \text{ ksi} \quad (\text{Eq. E2.1-1})
\]

Polar radius of gyration of cross-section about shear center:

\[
r_o = \sqrt{r_z^2 + r_y^2 + x_o^2} = 2.019 \text{ in} \quad (\text{Eq. E2.2-4})
\]

\[
\beta = 1 - \left(\frac{x_o}{r_o}\right)^2 = 1 - \left(\frac{-1.28}{2.019}\right)^2 = 0.598 \quad (\text{Eq. E2.2-3})
\]

\[
\sigma_f = \frac{1}{A_g r_o^2} \left[ GJ + \frac{n^2 E C_w}{(K_t L_t)^2} \right] = \frac{1}{0.422 \times 2.019^2} \left[ 11,200 \times 0.000451 + \frac{n^2 \times 29,000 \times 0.457}{(1 \times 120)^2} \right] = 8.243 \text{ ksi} \quad (\text{Eq. E2.2-5})
\]

\[
\sigma_{ez} = F_{crez} = 41.22 \text{ ksi} \quad (\text{Eq. E2.2-6})
\]

The flexural-torsional buckling stress:
\[
F_{cre} = \frac{1}{2\beta} \left[ (\sigma_{ez} + \sigma_t) \cdot \sqrt{(\sigma_{ez} + \sigma_t)^2 - 4\beta\sigma_{ez}\sigma_t} \right] 
\]
(Eq. E2.2-1)
\[
= \frac{1}{2 \times 0.598} \left[ (41.22 + 8.197) \cdot \sqrt{(41.22 + 8.197)^2 - 4 \times 0.598 \times 41.22 \times 8.197} \right] = 7.560 \text{ ksi}
\]
The elastic global buckling stress about the z axis is the minimum of \(F_{cre}\) and \(F_{crez1}\); so \(F_{crez} = 7.560 \text{ ksi}\).

The compressive stress capacity is:
\[
\lambda_{ez} = \sqrt{\frac{F_y}{F_{cre}}} = \sqrt{\frac{50}{7.560}} = 2.572 > 1.5 
\]
(Eq. E2-4)
\[
F_{nx} = \frac{0.877}{\lambda_{ez}^2} F_y = \frac{0.877}{(2.579)^2} \times 50 = 6.630 \text{ ksi} 
\]
The elastic flexural buckling stress about the y axis:
\[
F_{crey1} = \frac{n^2 E}{(K_y L_y / r_y)^2} = \frac{n^2 \times 29,000}{(1 \times 120 / 0.536)^2} = 7.275 \text{ ksi}
\]
(Eq. E2.1-1)
The elastic global buckling stress about the z axis is the minimum of \(F_{cre}\) and \(F_{crey1}\); so \(F_{crey} = 7.275 \text{ ksi}\).
\[
\lambda_{cy} = \sqrt{\frac{F_y}{F_{crey}}} = \sqrt{\frac{50}{7.275}} = 2.622 > 1.5 
\]
(Eq. E2-4)
\[
F_{ny} = \frac{0.877}{\lambda_{cy}^2} F_y = \frac{0.877}{(2.622)^2} \times 50 = 6.380 \text{ ksi}
\]
(Eq. E2.2)

Global buckling about the Y axis governs.

Nominal capacity against global buckling:
\[
P_n = A_g F_n = 0.422 \times 6.380 = 2.692 \text{ kips}
\]
The available axial strength:

LRFD: \(\phi_{c} P_n = 0.85 \times 2.692 = 2.289 \text{ kips}\)

ASD: \(P_n / \Omega_c = 2.692 / 1.8 = 1.496 \text{ kips}\)

Determine the compression capacity for local buckling interacting with yielding and global buckling as per E3:

The effective area, \(A_e\), is equal to the gross area, \(A_g = 0.422 \text{ in}^2\). By inspection, the local capacity, \(P_{nl}\), is equal to the global buckling capacity in this case.

LRFD: \(\phi_{n} P_{nl} = 0.85 \times 2.692 = 2.289 \text{ kips}\)

ASD: \(P_{nl} / \Omega_c = 2.692 / 1.8 = 1.496 \text{ kips}\)

Determine the compression capacity for distortional buckling as per E4:

The elastic distortional buckling stress, \(F_{crd} = 149.8 \text{ ksi}\).

The elastic distortional buckling load, \(P_{crd} = A_g \times F_{crd} = 0.422 \times 149.8 = 63.21 \text{ kips}\).
\[
P_y = A_g \times F_y = 0.422 \times 50 = 21.1 \text{ kips}
\]
(Eq. E4.1-4)
\[
\lambda_d = \sqrt{\frac{P_y}{P_{crd}}} = \sqrt{\frac{21.1}{63.21}} = 0.578 > 0.561 
\]
(Eq. E4.1-3)
\[ P_{nd} = \left[ 1 - 0.25 \left( \frac{P_{crd}}{P_y} \right)^{0.6} \right] \left( \frac{P_{crd}}{P_y} \right)^{0.6} P_y \]

(Eq. 4.1-2)

\[ = \left[ 1 - 0.25 \left( \frac{63.21}{21.1} \right)^{0.6} \right] \left( \frac{63.21}{21.1} \right)^{0.6} 21.1 = 21.08 \text{ ksi} \]

The available axial strength:

LRFD: \( \phi P_{nd} = 0.85 \times 21.08 = 17.91 \text{ kips} \)

ASD: \( P_{nd}/\Omega_c = 21.08 / 1.8 = 11.71 \text{ kips} \)

STAAD.Pro CODE CHECKING - (AISI S100-16) [ASD] (v1.0)
********************************************************
ALL UNITS ARE IN "INCH" AND "KIP" (U.N.O.)
- MEMBER: 1 (Contd.....)
```
V. AISI 2016 CS Flexural Strength

Verify the flexural strength of a cold-formed channel section according to the AISI S100 2016 specification using both the LRFD and ASD methods.

Details
A 5’ long, simply supported beam is subjected to a concentrated load of 1 kip/in at midspan in both the global Y and Z directions. The section used is a 12CS4x105, Gr. 36 steel.

Section Properties
Taken from AISI Manual, Cold-Formed Steel Design - Vol. 1, 2017 Table I-1.

Area, \( A_g = 2.20 \text{ in}^2 \)
Radius of gyration z axis, \( r_z = 4.65 \text{in} \)
Radius of gyration y axis, \( r_y = 1.39 \text{in} \)
Distance from centroid to shear center, \( x_o = -2.63 \text{in} \)
Elastic section modulus y axis, \( S_{fy} = 1.45 \text{ in}^3 \)
Elastic section modulus z axis, \( S_{fz} = 7.91 \text{ in}^3 \)
Torsional constant, \( J = 0.00808 \text{ in}^4 \)
Warping constant, \( C_w = 122 \text{ in}^6 \)
\( j = 6.74 \text{ in} \)

Material Properties
\( E = 29,000 \text{ ksi} \)
\( G = 11,300 \text{ ksi} \)
\( F_y = 36 \text{ ksi} \)
Validation

The modification factor, $C_b$, for a simply-supported beam under a concentrated load at midspan:

$$C_b = \frac{12.5 \times M_{\text{max}}}{2.5 \times M_{\text{max}} + 3 \times M_a + 4 \times M_b + 3 \times M_c} = 1.32$$  \hfill (Eq. F2.1.1-2)

Polar radius of gyration of cross-section about shear center:

$$r_o = \sqrt{r_z^2 + r_y^2 + x_o^2} = 5.52 \text{ in}$$  \hfill (Eq. F2.1.1-3)

Major axis bending:

$$\sigma_{ey} = \frac{n^2 E}{(K_y L_y / r_y)^2} = \frac{n^2 \times 29,000}{(1 \times 60 / 1.39)^2} = 153.6 \text{ ksi}$$  \hfill (Eq. F2.1.1-4)

$$\sigma_t = \frac{1}{A_o} \left[ \frac{n^2 E C_w}{(K_t L_t)^2} \right] = \frac{1}{2.20 \times 5.52^2} \left[ 11,200 \times 0.00808 + \frac{n^2 \times 29,000 \times 122}{(1 \times 60)^2} \right] = 146.0 \text{ ksi}$$  \hfill (Eq. F2.1.1-5)

$$F_{\text{cre}} = \frac{C_b A_o}{S_f} \sqrt{\sigma_{ey} \times \sigma_t} = \frac{1.32 \times 5.52 \times 2.20}{7.91} \sqrt{153.6 \times 146.0} = 299.4 \text{ ksi}$$  \hfill (Eq. F2.1.1-1)

Per F2.1, where $F_{\text{cre}} > 2.78 F_y = 2.78(36) = 100.1 \text{ ksi}, F_n = F_y$ (Eq. F2.1-3).

Nominal capacity against lateral-torsional buckling about the major axis:

$$M_{\text{bey}} = S_f F_n = 7.91 \times 36 = 284.8 \text{ in}\cdot\text{kips}$$

The available flexural strength about the major axis:

LRFD: $\phi_b M_{\text{bey}} = 0.9 \times 284.8 = 256.3 \text{ in}\cdot\text{kips}$

ASD: $M_{\text{bey}} / \Omega_b = 284.8 / 1.67 = 170.5 \text{ in}\cdot\text{kips}$

Minor axis bending:

$$\sigma_{ez} = \frac{n^2 E}{(K_z L_z / r_z)^2} = \frac{n^2 \times 29,000}{(1 \times 60 / 4.65)^2} = 1,719 \text{ ksi}$$  \hfill (Eq. F2.1.2-2)

Simply-supported beam, so $C_{TF} = 1$; assume compression on shear center side of centroid, so $C_S = +1$.

$$F_{\text{cre}} = \frac{C_S A_o}{C_{TF} S_f} \left[ j + C_S \sqrt{j^2 + r_o^2 (\sigma_t / \sigma_{ez})} \right] = \frac{1.0 \times 2.20 \times 1.719}{1.0 \times 1.45} \left[ 6.74 + 1.0 \sqrt{(6.74)^2 + (5.52)^2 (146.0 / 1,719)} \right]$$

Per F2.1, where $F_{\text{cre}} > 2.78 F_y = 2.78(36) = 100.1 \text{ ksi}, F_n = F_y$ (Eq. F2.1-3).

Nominal capacity against lateral-torsional buckling about the major axis:

$$M_{\text{bey}} = S_f F_n = 1.45 \times 36 = 52.2 \text{ in}\cdot\text{kips}$$

The available flexural strength about the major axis:

LRFD: $\phi_b M_{\text{bey}} = 0.9 \times 52.2 = 47.0 \text{ in}\cdot\text{kips}$

ASD: $M_{\text{bey}} / \Omega_b = 52.2 / 1.67 = 31.3 \text{ in}\cdot\text{kips}$

V. AISI 2016 CU Nominal and Local Axial Capacity

Determine the nominal axial capacity and local axial capacity of a 72-Inch-long member subjected to axial compression load.

Details

The member is a 6’ simply-supported span subject to a 1 kip axial load. The section used is a 800CU125-68 channel without lips.

Section properties:

- Depth: $D = 8.25$ in
- Width: $B = 1.25$ in
- Thickness: $t = 0.0713$ in
- Inner radius: $R = 0.1069$ in
- Area: $A = 0.748$ in$^2$
- Moment of inertia about major axis: $I_x = 6.0$ in$^4$
- Moment of inertia about minor axis: $I_y = 0.0703$ in$^4$
- Torsional constant: $J = 0.00127$ in$^4$
- Distance between centroid and shear center: $x_0 = -0.427$ in
- Radius of gyration about major axis: $r_x = \sqrt{\frac{I_x}{A}} = 2.832$ in.
- Radius of gyration about minor axis: $r_y = \sqrt{\frac{I_y}{A}} = 0.307$ in.
- Polar radius of gyration: $r_\theta = \sqrt{r_x^2 + r_y^2 + x_0^2} = 2.881$ in.
- Warping constant: $C_w = 0.92$ in$^6$

Material properties:

- $E = 29,500$ ksi
- $G = 11,300$ ksi
- $F_y = 50$ ksi

Validation

Section Dimension Checks
Radius to thickness ratio:

\[
\frac{R}{t} = \frac{0.1069}{0.0713} = 1.499 < 10 \text{ (OK)}
\]

Width to thickness ratio:

\[
\frac{W}{t} = \frac{1.072}{0.0713} = 15.03 < 60 \text{ (OK)}
\]

Depth to thickness ratio:

\[
\frac{d}{t} = \frac{7.849}{0.0713} = 110.7 < 200 \text{ (OK)}
\]

Nominal Strength of Global Buckling

From Cl. E.2 of AISI S100-16:

\[
\sigma_x = \frac{n^2 \times E}{K_y \times L_y} = \frac{n^2 \times 29000}{1 \times 72^2} = 442.9 \text{ ksi}
\]

\[
F_{crey} = \frac{n^2 \times E}{(K_y \times L_y)^2} = \frac{n^2 \times 29000}{(234.9)^2} = 5.189 \text{ ksi}
\]

\[
\sigma_t = \frac{1}{A \times r_0^2} \times \left[ G \times J + \frac{n^2 \times E \times C_w}{(K_l \times L_l)^2} \right] = \frac{1}{0.748(2.881)^2} \times \left[ 11,300 \times 0.001 + \frac{n^2 \times 29,000 \times 0.92}{(1 \times 72)^2} \right] = 10.50 \text{ ksi}
\]

\[
\beta = 1 - \frac{x_0^2}{r_0^2} = 1 - \left( \frac{-0.427}{2.881} \right)^2 = 0.978
\]

\[
F_{(cre)}T_F = \frac{1}{2 \times \beta} \times \left[ \sigma_{ex} + \sigma_t \cdot \sigma_{ex} \cdot \sigma_t \right]
\]

\[
= \frac{1}{2 \times 0.978} \times \left[ 442.9 + 10.50 \cdot \sqrt{(442.9 + 10.50)^2 \cdot 4 \times 0.978 \times 442.9 \times 10.50} \right] = 10.49 \text{ ksi}
\]

Since: \( F_{(cre)}T_F > F_{crey} \), \( F_{(cre)} = 5.189 \text{ ksi} \)

\[
\lambda_c = \sqrt{\frac{F_y}{F_{(cre)}}} = 3.104 > 1.5
\]

\[
F_n = \frac{0.877}{\lambda_c^2} \times F_y = \frac{0.877}{(3.104)^2} \times 50 = 4.551 \text{ ksi}
\]

\[
P_{ne} = A \times F_n = 0.748 \times 4.551 = 3.404 \text{ kips}
\]

Allowable nominal axial strength (ASD):

\[
\frac{P_{ne}}{\Omega_c} = \frac{3.404}{1.80} = 1.891 \text{ kips}
\]
Design nominal axial strength (LRFD):

\[ P_{ne} \times \phi_c = 3.404 \times 0.85 = 2.893 \text{ kips} \]

Local Buckling Interacting with Lateral-Torsional Buckling

From Cl. E.3.1 of AISI S100-16:

Flange elements:

\[ s = 1.28 \times \sqrt{\frac{E}{F_n}} = 1.28 \times \sqrt{\frac{29,000}{4.551}} = 102.2 \quad \text{(Eq 1.3-7, Appendix 1 of AISI S100-16)} \]

\[ \frac{W}{t} = 15.03 < 0.328 \times s = 33.51 \]

Therefore, calculation of the effective width is not required.

Web element:

\[ \frac{d}{t} = 110.7 < 500 \quad \text{(OK)} \]

\[ k = 4.0 \]

\[ F_{cr} = \frac{k \times n^2 \times E}{12 \times (1 - \mu^2)} \times \left( \frac{t}{d} \right)^2 = \frac{4 \times n^2 \times 29,000}{12 \times (1 - 0.3^2)} \times \left( \frac{0.0713}{7.849} \right)^2 = 8.553 \text{ ksi} \]

\[ \lambda = \sqrt{\frac{F_n}{F_{cr}}} = \sqrt{\frac{4.551}{8.553}} = 0.729 \]

\[ \rho = \frac{1 - 0.22}{\lambda} = 0.958 \]

\[ D_e = \rho \times d = 0.958 \times 7.894 = 7.562 \text{ in} \]

Effective area,

\[ A_e = A - (d \times D_e) \times t = 0.748 \times \left( 7.894 \times 7.562 \right) \times 0.0713 = 0.724 \text{ in}^2 \]

\[ P_{nl} = A_e \times F_n = 0.724 \times 4.551 = 3.295 \text{ kips} \]

Allowable local axial strength (ASD):

\[ \frac{P_{nl \Omega_b}}{\Omega_b} = \frac{3.295}{1.80} = 1.830 \text{ kips} \]

Design local axial strength (LRFD):

\[ P_{nl} \times \phi_b = 3.295 \times 0.85 = 2.801 \text{ kips} \]
## Results

V. AISI 2016 CU Nominal Moment Capacity

Determine the nominal moment axial capacity of a simply-supported beam subject to a concentrated load at mid-span.
The member is a 10' simply-supported span subject to a 1 kip load applied at midspan. The section used is a CU_8X2_0.06 channel without lips. The member is laterally supported at the one-fourth points along the span.

Section properties:

- Depth: \( D = 8 \text{ in} \)
- Width: \( B = 2 \text{ in} \)
- Thickness: \( t = 0.06 \text{ in} \)
- Inner radius: \( R = 3/32 \text{ in} \)
- Area: \( A = 0.706 \text{ in}^2 \)
- Moment of inertia about major axis: \( I_x = 6.129 \text{ in}^4 \)
- Moment of inertia about minor axis: \( I_y = 0.229 \text{ in}^4 \)
- Major axis section modulus: \( S_x = 1.532 \text{ in}^3 \)
- Minor axis section modulus: \( S_y = 0.137 \text{ in}^3 \)
- Torsional constant: \( J = 0.00085 \text{ in}^4 \)
- Distance between centroid and shear center: \( x_0 = -0.919 \text{ in} \)
- Radius of gyration about major axis: \( r_x = \sqrt{\frac{I_x}{A}} = 2.946 \text{ in} \)
- Radius of gyration about minor axis: \( r_y = \sqrt{\frac{I_y}{A}} = 0.569 \text{ in} \)
- Polar radius of gyration: \( r_0 = \sqrt{r_x^2 + r_y^2 + x_0^2} = 3.138 \text{ in} \)
- Warping constant: \( C_w = 2.568 \text{ in}^6 \)

Material properties:

- \( E = 29,500 \text{ ksi} \)
- \( G = 11,300 \text{ ksi} \)
- \( F_y = 33 \text{ ksi} \)
- \( F_u = 58 \text{ ksi} \)

Validation

Elastic Critical Lateral-Torsional Stress Per Cl. F2.1.1 of AISI S100-16:

\[
\sigma_{ey} = \frac{\pi^2 \times E}{K_y \times L_y \times r_y^2}
\]

where

- \( K_y \) = Effective length factor for bending about \( y \) axis = 1
- \( L_y \) = Unbraced length of member for bending about \( y \) axis = 30 in
So, \( \sigma_y \approx \frac{n^2 \times 29,000}{(1 \times 30 / 0.569)^2} = 103.1 \) ksi

\[
C_b = \frac{12.5 \times M_{\text{max}}}{2.5 M_{\text{max}} + 3M_A + 4M_B + 3M_C}
\]

where

- \( M_{\text{max}} = \) Absolute value of maximum moment in unbraced segment = 30 kip in
- \( M_A = \) Absolute value of moment at quarter point of unbraced segment = 18.75 kip in
- \( M_B = \) Absolute value of moment at mid-point of unbraced segment = 22.50 kip in
- \( M_C = \) Absolute value of moment at three-quarter point of unbraced segment = 26.25 kip in

\[
C_b = \frac{12.5 \times 30}{2.5 \times 30 + 3 \times 18.75 + 4 \times 22.5 + 3 \times 26.25} = 1.25
\]

(Eq. F2.1.1-2)

The elastic buckling stress:

\[
F_{\text{cre}} = C_b \times r_0 \times \frac{A}{S_x} \times \sqrt{\sigma_y} \times a_t = 1.25 \times 3.138 \times \frac{0.706 \times 3.138^2}{1.67} \times \sqrt{103.1 \times 122.9} = 203.5 \text{ ksi}
\]

(Eq. F2.1.1-1)

The nominal flexural strength:

\[
M_n = S_x \times F_y = 1.532 \times 33 = 50.57 \text{ kip in}
\]

(Eq. F2.1-1)

Allowable flexural strength (ASD):

\[
\frac{M_n}{\Omega_b} = \frac{50.57}{1.67} = 30.278 \text{ kip in}
\]

Design flexural strength (LRFD):

\[
M_n \times \phi_b = 50.57 \times 0.9 = 45.508 \text{ kip in}
\]

STAAD.Pro CODE CHECKING - (AISI S100-16) [ASD] (v1.0)

ALL UNITS ARE IN "INCH" AND "KIP " (U.N.O.)

- MEMBER: 1 (Contd.....)
### V. AISI 2016 Cylindrical Tubular Section

Determine the flexural strength of a closed cylindrical tubular member subjected to axial compression and bending moment according to AISI S100 2016 specification.
Reference

Related Links

• D1.E.3 Design Procedure (on page 1182)

Details

The member is a 10' simply-supported span. The section is a 8" diameter closed cylindrical tube with a wall thickness of 0.1".

Axial loads:

- Dead load: \( P_{DL} = 7.5 \text{ kips} \)
- Roof live load: \( P_{LR} = 20 \text{ kips} \)

Transverse loads:

- Wind load: \( P_{W} = 50 \text{ kips} \) (concentrated load at mid-span)

Section properties:

- Area: \( A = 2.482 \text{ in}^2 \)
- Moment of inertia: \( I = 19.37 \text{ in}^4 \)
- Section modulus: \( S_f = 4.841 \text{ in}^3 \)
- Radius of gyration: \( r = \sqrt{\frac{I}{A}} = 2.794 \text{ in.} \)

Material properties:

- \( E = 29,500 \text{ ksi} \)
- \( G = 11,300 \text{ ksi} \)
- \( F_y = 42 \text{ ksi} \)
- \( F_u = 58 \text{ ksi} \)

Validation

Design forces:

Governing load combination is DL + RLL + WL

\[ Mu = 1.0 \times (5 \text{ kips}) \times (120 \text{ in}) / 4 = 150 \text{ in kips} \]

Section Dimension Checks

Check the outside diameter to wall thickness ratio:

\[ \frac{D}{t} = 8.0 / 0.1 = 80 \]

\[ \frac{D}{t} \text{ Limit} = \frac{0.441 \times E}{F_y} = \frac{0.441 \times 29500}{42} = 310 > 80 \]

Hence, OK.

Determine Axial Capacity

Determine the governing equation for \( F_n \):
\[
\frac{0.0714 \times E}{F_y} = \frac{0.0714 \times 29500}{42} = 50.2
\]
\[
\frac{0.318 \times E}{F_y} = \frac{0.318 \times 29500}{42} = 223
\]

Since: \( \frac{0.0714 \times E}{F_y} < \frac{D}{t} < \frac{0.318 \times E}{F_y} \)

\[
F_n = \left[0.970 + 0.020 \frac{E/(F_y)}{D} \right] F_y = \left[0.970 + 0.020 \frac{29500/42}{80} \right] 42 = 48.1 \text{ ksi}
\]

Determine Flexural Capacity

Nominal flexural strength (resistance) for yielding and global buckling:

\[
M_{ne} = S_f \times F_n = 4.841 \times 48.1 = 233 \text{ in kip}
\]

Allowable flexural strength (ASD):

\[
\frac{M_{ne}}{\Omega_b} = \frac{233}{1.67} = 140 \text{ in kip}
\]

Design flexural strength (LRFD):

\[
M_{ne} \times \phi_b = 233 \times 0.95 = 221 \text{ in kip}
\]

V. AISI 2016 Hat Section

Determine the flexural strength of a cold-formed hat section according to the AISI S100 2016 specification.

**Reference**

**Related Links**

- [D1.E.3 Design Procedure](#) (on page 1182)

**Details**

The member is 6' simply supported span. The section is a 3HU4.5X135. The top flange is in compression and is fully braced. Inelastic reserve is not considered.

**Member loads:**

- Dead load: \( w_{DL} = 120 \text{ plf} \)
- Live load: \( w_{LL} = 700 \text{ plf} \)

**Section properties:**

- \( t = 0.135 \text{ in} \) (Note that STAAD.Pro uses a thickness of 0.14"
- \( R = 0.1875 \text{ in} \) (Note that STAAD.Pro uses a bend radius of 0.19"

- Area: \( A = 1.74 \text{ in}^2 \)
- Moment of inertia, weak axis: \( I_z = 2.47 \text{ in}^4 \)
- Moment of inertia, strong axis: \( I_y = 8.29 \text{ in}^4 \)
- Section modulus, strong axis: \( S_y = 1.52 \text{ in}^3 \)

**Material properties:**

- \( E = 29,500 \text{ ksi} \)
- \( F_y = 50 \text{ ksi} \)

**Validation**

**Design forces**

\[
M_y = (0.12)(6)^2/8 + (0.7)(6)^2/8 = 3.69 \text{ ft·kips} = 44.3 \text{ in·kips}
\]

\[
M_{uy} = 1.2[(0.12)(6)^2/8] + 1.6[(0.7)(6)^2/8] = 5.69 \text{ ft·kips} = 68.3 \text{ in·kips}
\]

**Bending Capacity**

Calculate nominal strength:

\[
M_n = S_e \times F_y = 1.52 \times 50 = 76.0 \text{ in·kips}
\]

Allowable strength:
Verification Examples

V.09 Steel Design

\[ \frac{M_n}{\Omega_b} = \frac{76.0}{1.67} = 45.5 \text{ in·kip} \]

Ultimate strength:
\[ \phi_b M_{ne} = 0.90 \times 76.0 = 68.4 \text{ in·kip} \]

**Results**

Table 817:

<table>
<thead>
<tr>
<th>Result Type</th>
<th>Reference</th>

V. AISI 2016 SHS section

Determine the flexural Strength and axial strength of a square hollow section according to AISI S100 2016 Specification using both LRFD and ASD methods.

Details

The member is a simply-supported, 10 ft span. The member is subject to a transverse uniform dead load of 100 lbs/ft. Additionally, the member is subject to a 7,500 lb axial dead load and a 37,500 lb axial live load. The section used is a HSS 6x6x0.125. The beam-column is not subject to moment or axial loading due to lateral translation of the structure.

Section Properties

Depth of section, \( d = 6 \text{ in} \)
Width of section, \( b = 6 \text{ in} \)
Thickness, \( t = 0.125 \text{ in} \)
Area, \( A = 2.7 \text{ in}^2 \)
Moment of inertia, \( I_{zz} = 15.5 \text{ in}^4 \)
Section modulus, \( Z_{zz} = 5.167 \text{ in}^3 \)
Radius of gyration of cross-section: \( r_x = \sqrt{\frac{I_x}{A}} = 2.393 \text{ in} \).
Torsion constant, \( J = 23.63 \text{ in}^4 \)

Material Properties

\( E = 29,500 \text{ ksi} \)
\( G = 11,300 \text{ ksi} \)
\( F_y = 46 \text{ ksi} \)
\( F_u = 58 \text{ ksi} \)

Design Forces

ASD: \( M_z = 15 \text{ in} \cdot \text{k}, P = 45 \text{ kip} \)
LRFD \( M_{az} = 1.2 (15) = 18 \text{ in} \cdot \text{k}, P_u = 1.2 (7.5) + 1.6 (37.5) = 69 \text{ kip} \)
**Validation**

**Axial Compressive Strength**

Nominal Flexural Buckling Stress

\[
\frac{K_x \times L_x}{r_x} = \frac{K_y \times L_y}{r_y} = \frac{1.0 \times 120}{2.393} = 50.15
\]

\[
F_{\text{cre}} = \frac{n^2 \times E}{(K \times L / r)^2} = \frac{n^2 \times 29,500}{(50.15)^2} = 115.8 \text{ ksi}
\]

\[
\lambda_c = \sqrt{\frac{F_y}{F_{\text{cre}}}} = \sqrt{\frac{46}{115.8}} = 0.630 < 1.5
\]

\[
F_n = 0.658 \lambda_c^2 \times F_y = 0.658 (0.630)^2 \times 46 = 38.95 \text{ ksi}
\]

\[
P_n = A \times F_n = 2.7 \times 38.95 = 105.2 \text{ kips}
\]

**Allowable nominal axial strength (ASD):**

\[
\frac{P_n}{\Omega_c} = \frac{105.2}{1.80} = 58.43 \text{ kips}
\]

**Design nominal axial strength (LRFD):**

\[
\phi_c \times P_n = 0.85 \times 105.2 = 89.40 \text{ kips}
\]

**Nominal Sectional Flexural Strength**

According to Eq. F2.1.4-1 in the specification, the minimum unbraced length of a closed box member subject to lateral-torsional buckling, \(L_u\), is calculated as:

\[
L_u = 0.36 \times C_b \times n \sqrt{EGJy} = 138 \text{ ft}
\]

Since \(L_u > 10\) ft, global buckling does not need to be considered and \(F_n = F_y = 46\) ksi

\[
M_y = S_f \times F_n = 5.167 \times 46 = 237.7 \text{ ksi}
\]

**Allowable nominal axial strength (ASD):**

\[
\frac{M_y}{\Omega_b} = \frac{237.7}{1.67} = 142.3 \text{ in·kips}
\]

**Design nominal axial strength (LRFD):**

\[
\phi_b \times M_y = 0.90 \times 237.79 = 213.9 \text{ in·kips}
\]

**Governing strength ratio:**

LRFD: \(18 / 213.9 = 0.084\)

ASD: \(15 / 142.3 = 0.105\)

### V. AISI 2016 Zee Section

Determine the axial strength and flexural strength of a cold-formed zee section without lips according to AISI S100 2016 Specification using the LRFD method.

**Details**

The member is a simply-supported, 2m span. The member is subject to a uniform load of 60 lbs/ft. The section used is an 8ZU 12.5x105.

**Section Properties**

- Depth of section, \( d = 8 \) in
- Width of section, \( b = 1.25 \) in
- Thickness, \( t = 0.105 \) in
- Fillet radius, \( r = 0.188 \) in
- Area, \( A = 1.059 \) in\(^2\)
- Moment of inertia major axis, \( I_{zz} = 7.88 \) in\(^4\)
- Moment of inertia minor axis, \( I_{yy} = 0.120 \) in\(^4\)
- Section modulus major axis, \( Z_{zz} = 1.97 \) in\(^3\)
- Section modulus minor axis, \( Z_{yy} = 0.096 \) in\(^3\)
- Torsion constant, \( J = 0.004 \) in\(^4\)
- Warping constant, \( C_w = 1.546 \) in\(^6\)
- Radius of gyration about major axis: \( r_x = \sqrt{\frac{I_x}{A}} = 2.728 \) in.
- Radius of gyration about minor axis: \( r_y = \sqrt{\frac{I_y}{A}} = 0.337 \) in.
- Polar radius of gyration: \( r_0 = \sqrt{r_x^2 + r_y^2 + r_z^2} = 2.749 \) in.

**Material Properties**

\( E = 29,000 \) ksi

Radius to thickness ratio:

\[ \frac{R}{t} = \frac{0.188}{0.105} = 1.79 < 10 \text{ (OK)} \]

Width to thickness ratio:

\[ \frac{W}{t} = \frac{0.957}{0.105} = 9.11 < 60 \text{ (OK)} \]

Depth to thickness ratio:

\[ \frac{d}{t} = \frac{7.414}{0.105} = 70.60 < 200 \text{ (OK)} \]

Calculate Axial Strength

Along Z axis:

\[ \frac{K_x \times L_x}{r_x} = \frac{1 \times 78.74}{2.728} = 28.86 \]

\[ \sigma_x = \frac{\pi^2 \times E}{\left( \frac{K_x \times L_x}{r_x} \right)^2} = \frac{\pi^2 \times 29,000}{(28.86)^2} = 343.6 \text{ ksi} \]

\[ \sigma_t = \frac{1}{A \times r_o^2} \times \left[ G \times J + \frac{\pi^2 \times E \times C_w}{(K_t \times L_t)^2} \right] = \frac{1}{1.059(2.798)^2} \times \left[ 11,200 \times 0.004 + \frac{\pi^2 \times 29,000 \times 1.546}{(1 \times 78.74)^2} \right] = 14.37 \text{ ksi} \]

\( F_{crex} \) is the lesser of \( \sigma_x \) and \( \sigma_t \); \( F_{crex} = 14.37 \text{ ksi} \)

\[ \lambda_{cz} = \sqrt{\frac{F_y}{F_{(crex)}}} = 1.583 > 1.5 \]

\[ F_{nz} = \frac{0.877}{\lambda_{cz}^2} \times F_y = \frac{0.877}{(1.583)^2} \times 36 = 12.60 \text{ ksi} \]

\[ P_{nz} = A \times F_{nz} = 1.059 \times 12.60 = 13.34 \text{ kips} \]

Along Y axis:

\[ \frac{K_y \times L_y}{r_y} = \frac{1 \times 78.74}{0.337} = 233.7 \]
\[ \sigma_y = \frac{\mu^2 \times E}{\left( \frac{K_y \times L_y}{r_y} \right)^2} = \frac{\mu^2 \times 29,000}{(233.7)^2} = 5.244 \text{ ksi} \]

\( F_{crey} \) is the lesser of \( \sigma_y \) and \( \sigma_t \); \( F_{crey} = 5.244 \text{ ksi} \)

\[ \lambda_{cy} = \sqrt{\frac{F_y}{F_{crey}}} = 2.62 > 1.5 \]

\[ F_{ny} = \frac{0.877}{\lambda_{cy}^2} \times F_y = \frac{0.877}{(2.62)^2} \times 36 = 4.599 \text{ ksi} \]

\[ P_{ny} = A \times F_{nz} = 1.059 \times 4.599 = 4.869 \text{ kips (Governs)} \]

Design nominal axial strength (LRFD):

\[ P_{ny} \times \phi_c = 4.869 \times 0.85 = 4.140 \text{ kips} \]

**Calculate Bending Strength**

Major axis nominal moment capacity:

\[ M_z = S_z \times F_y = 1.97 \times 36 = 70.92 \text{ in-kips} \]

Major axis ultimate moment capacity:

\[ \phi_b M_z = 0.90 \times 70.92 = 63.83 \text{ in-kip} \]

Minor axis nominal moment capacity:

\[ M_y = S_y \times F_y = 0.096 \times 36 = 3.456 \text{ in-kips} \]

Minor axis ultimate moment capacity:

\[ \phi_b M_y = 0.90 \times 3.456 = 3.110 \text{ in-kip} \]

**Lateral-Torsional Buckling Strength**

\[ \sigma_{ey} = \sigma_y = 5.244 \text{ ksi} \]

\[ C_b = \frac{12.5 M_{\text{max}}}{2.5 M_{\text{max}} + 3 M_A + 4 M_B + 3 M_C} = 1.136 \]

For singly symmetric sections bent about the axis of symmetry:

\[ F_{crez} = \frac{C_b \sigma_{ey} A}{2 S_f \sqrt{\sigma_{ey} \sigma_t}} = \frac{1.136(2.749)(1.059)}{2(1.97)} \sqrt{5.244 \times 14.37} = 7.283 \text{ ksi} \]

where

\[ S_f = \text{the elastic section modulus for the unreduced section relative to the extreme compression fiber per AISI S100 2016. Hence, } S_f = S_z. \]

For \( F_{cre} < 0.56 F_y = 0.56 \times 36 = 20.16, F_n = F_{crez}. \)

\[ M_{ne} = F_n \times S_f = 7.283 \times 1.97 = 14.35 \text{ in-k} \]

Design nominal lateral-torsional buckling strength (LRFD):

\[ \phi_b M_{ne} = 0.9 \times 14.35 = 12.92 \text{ in-kips} \]

V. AISI 2016 ZS Compressive Strength

Verify the compressive strength of a cold-formed zee section with lips per the AISI S100 2016 specification.

Details

A 15' long, simply supported beam is subjected to a 10 kip axial load (compression). The section used is a 12ZS3.25x105, Grade 36 steel.

Section Properties

Taken from AISI Manual, Cold-Formed Steel Design - Vol. 1, 2017 Table I-1.

Area, $A_g = 2.09 \text{ in}^2$
Radius of gyration z axis, $r_z = 4.57 \text{ in}$
Radius of gyration y axis, $r_y = 1.49 \text{ in}$
Elastic section modulus y axis, $S_{fy} = 1.22 \text{ in}^3$
Elastic section modulus z axis, $S_{fz} = 7.29 \text{ in}^3$
Torsional constant, $J = 0.00769 \text{ in}^4$
Warping constant, $C_w = 123 \text{ in}^6$

Material Properties

$E = 29,000 \text{ ksi}$
$G = 11,300 \text{ ksi}$
$F_y = 36 \text{ ksi}$

Validation

The elastic flexural buckling stress about the z axis:
F_{crez1} = \frac{n^2E}{(K_z/r_z)^2} = \frac{n^2 \times 29,000}{(1 \times 180 / 4.57)^2} = 184.5 \text{ ksi} \quad \text{(Eq. E2.1-1)}

Polar radius of gyration of cross-section about shear center:

r_o = \sqrt{r_z^2 + r_y^2} = 4.81 \text{ in} \quad \text{(Eq. E2.2-4)}

\sigma_t = \frac{1}{A_g r_o^2} \left[ GJ + \frac{n^2EC_w}{(K_t L_t)^2} \right] = \frac{1}{2.09 \times 4.81^2} \left[ 11,200 \times 0.00769 + \frac{n^2 \times 29,000 \times 123}{(1 \times 180)^2} \right] = 24.14 \text{ ksi} \quad \text{(Eq. E2.2-5)}

\sigma_{ez} = F_{crez} = 184.5 \text{ ksi} \quad \text{(Eq. E2.2-6)}

Per E2.3, the flexural-torsional buckling stress is the lesser of \( \sigma_{ez} \) and \( \sigma_t \); so \( F_{crez} = 24.14 \text{ ksi} \).

The compressive stress capacity is:

\lambda_{cz} = \frac{F_{cy}}{F_{cre}} = \sqrt{\frac{36}{24.14}} = 1.221 < 1.5

\quad \text{ (Eq. E2.4)}

F_{ny} = \left( 0.658 \lambda_{cz}^2 \right) F_y = 0.658 \left( 1.221 \right)^2 36 = 19.28 \text{ ksi} \quad \text{(Eq. E2-2)}

Global buckling about the Y axis governs.

Nominal capacity against global buckling:

P_n = A_g F_n = 2.09 \times 16.69 = 34.89 \text{ kips}

The available axial strength:

LRFD: \( \phi_P_n = 0.85 \times 34.89 = 29.66 \text{ kips} \)

ASD: \( P_n/\Omega_c = 34.89 / 1.8 = 19.38 \text{ kips} \)

Determine the compression capacity for local buckling interacting with yielding and global buckling as per E3:

For local buckling about the Z axis, the effective area, \( A_e = 1.586 \text{ in}^2 \).

\quad \text{P_{nz} = A_e \times F_{nz} = 1.586 \times 19.28 = 30.56 \text{ kips}}

For local buckling about the Y axis, the effective area, \( A_e = 1.627 \text{ in}^2 \).

\quad \text{P_{ny} = A_e \times F_{nz} = 1.627 \times 16.69 = 27.15 \text{ kips}}

\quad \text{P_n is taken as the minimum of P_{nz}, P_{ny}, and P_{ne}; so P_n = 27.15 \text{ kips.}}

LRFD: \( \phi_P_n = 0.85 \times 27.15 = 23.08 \text{ kips} \)

ASD: \( P_n / \Omega_c = 27.15 / 1.8 = 15.06 \text{ kips} \)
Determine the compression capacity for distortional buckling as per E4:

The elastic distortional buckling stress, $F_{crd} = 30.84 \text{ ksi}$.

The elastic distortional buckling load, $P_{crd} = A_g \times F_{crd} = 2.09 \times 30.84 = 64.46 \text{ kips}$.

$$P_y = A_g \times F_y = 2.09 \times 36 = 75.24 \text{ kips}$$  \hspace{1cm} \text{(Eq. E4.1-4)}

$$\lambda_d = \sqrt{\frac{P_y}{P_{crd}}} = \sqrt{\frac{75.24}{64.46}} = 1.08 > 0.561$$  \hspace{1cm} \text{(Eq. E4.1-3)}

$$P_{nd} = \left[1 - 0.25 \left(\frac{P_{crd}}{P_y}\right)^0.6\right] \left(\frac{P_{crd}}{P_y}\right)^{0.6} P_y$$  \hspace{1cm} \text{(Eq. 4.1-2)}

$$= \left[1 - 0.25 \left(\frac{64.46}{75.24}\right)^0.6\right] \left(\frac{64.46}{75.24}\right)^{0.6} 75.24 = 52.95 \text{ ksi}$$

The available axial strength:

- LRFD: $\phi \not p_{nd} = 0.85 \times 52.95 = 45.01 \text{ kips}$
- ASD: $P_{nd}/\Omega_c = 52.95 / 1.8 = 29.42 \text{ kips}$

V.09 Steel Design

V. AISI 2016 ZS Flexural Strength

Verify the flexural strength in yielding of a cold-formed zee section according to the AISI S100 2016 specification using both the LRFD and ASD methods.

**Details**

A 1.5’ long, simply supported beam is subjected to a uniform load in the global Y direction. The section used is a 12ZS3.25x105, Gr. 50 steel.

**Section Properties**

Taken from AISI Manual, Cold-Formed Steel Design - Vol. 1, 2017 Table I-1.

\[
\text{Area, } A_g = 2.09 \text{ in}^2 \\
\text{Radius of gyration z axis, } r_z = 4.57 \text{ in}
\]
Radius of gyration y axis, $r_y = 1.49$ in
Elastic section modulus y axis, $S_{fy} = 1.22$ in$^3$
Elastic section modulus z axis, $S_{fz} = 7.29$ in$^3$
Torsional constant, $J = 0.00769$ in$^4$
Warping constant, $C_w = 123$ in$^6$

Material Properties

$E = 29,000$ ksi
$G = 11,300$ ksi
$F_y = 50$ ksi

Validation

The modification factor, $C_b$, for a simply-supported beam under a uniformly distributed load:

$$C_b = \frac{12.5 \times M_{\text{max}}}{2.5 \times M_{\text{max}} + 3 \times M_a + 4 \times M_b + 3 \times M_c} = 1.14$$  \hspace{1cm} (Eq. F2.1.1-2)

Polar radius of gyration of cross-section about shear center:

$$r_o = \sqrt{r_z^2 + r_y^2} = 4.81$$  \hspace{1cm} (Eq. F2.1.1-3)

Major axis bending:

$$\sigma_{ey} = \frac{n^2E}{(K_yL_y/r_y)^2} = \frac{n^2 \times 29,000}{(1 \times 18 / 1.49)^2} = 1,961 \text{ ksi}$$  \hspace{1cm} (Eq. F2.1.1-4)

$$\sigma_t = \frac{1}{A \frac{r_o}{2}} \left[ GJ + \frac{n^2EC_w}{(K_tL_t)^2} \right] = \frac{1}{2.09 \times 4.81^2} \left[ 11,200 \times 0.00769 + \frac{n^2 \times 29,000 \times 123}{(1 \times 18)^2} \right] = 2,249 \text{ ksi}$$  \hspace{1cm} (Eq. F2.1.1-5)

$$F_{\text{cre}} = \frac{C_b r_o A}{2S_f} \sqrt{\sigma_{ey} \times \sigma_t} = \frac{1.14 \times 4.81 \times 2.09}{2 \times 7.29} \sqrt{1.961 \times 2,249} = 1,651 \text{ ksi}$$  \hspace{1cm} (Eq. F2.1.1-1)

Per F2.1, where $F_{\text{cre}} > 2.78F_y = 2.78(50) = 139$ ksi, $F_n = F_y$ (Eq. F2.1-3).

Nominal capacity against lateral-torsional buckling about the major axis:

$$M_{nez} = S_{fz}F_n = 7.29 \times 50 = 364.5 \text{ in kips}$$

The available flexural strength about the major axis:

LRFD: $\phi_b M_{nez} = 0.9 \times 364.5 = 328.1 \text{ in kips}$
ASD: $M_{nez}/\Omega_b = 364.5 / 1.67 = 218.3 \text{ in kips}$

Minor axis bending:

$$F_{\text{cre}} = \frac{C_b r_o A}{2S_f} \sqrt{\sigma_{ey} \times \sigma_t} = \frac{1.14 \times 4.81 \times 2.09}{2 \times 7.29} \sqrt{1.961 \times 2,249} = 1,651 \text{ ksi}$$  \hspace{1cm} (Eq. F2.1.1-1)

Per F2.1, where $F_{\text{cre}} > 2.78F_y = 2.78(50) = 139$ ksi, $F_{ny} = F_y$ (Eq. F2.1-3).

Elastic section modulus of full unreduced cross-section relative to extreme fiber in first yielding: $S_{fyy} = S_{fy}$

Nominal capacity against lateral-torsional buckling about the major axis:

$$M_{ney} = S_{fy}F_n = 1.22 \times 50 = 61.0 \text{ in kips}$$
The available flexural strength about the major axis:

LRFD: \( \phi_b M_{ney} = 0.9 \times 61.0 = 54.9 \text{ in} \cdot \text{kips} \)
ASD: \( M_{ney} / \Omega_b = 61.0 / 1.67 = 36.5 \text{ in} \cdot \text{kips} \)

V. API

V.API K Joint

Verify the design of a simple K joint with axial load and in-plane bending.

Details

Design of node 3 in the following model.
Chord member (2 & 3): D = 500 mm, T = 20 mm ($A_c = 30,159 \text{ mm}^2$, $Z_c = 3,480,380 \text{ mm}^3$)
Brace member (5 & 7): d = 400 mm, t = 20 mm ($A_b = 23,876 \text{ mm}^2$, $Z_b = 2,160,790 \text{ mm}^3$)

<table>
<thead>
<tr>
<th>Table 820: Loads</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Member</strong></td>
</tr>
<tr>
<td>Chord</td>
</tr>
<tr>
<td>Brace</td>
</tr>
</tbody>
</table>

**Validation**

Design Parameters:

\[ \beta = \frac{d}{D} = 0.8 \]
So, \(0.2 < \beta < 1.0\) (OK)

\[ \gamma = \frac{D}{2T} = 12.5 \]
So, \(10 < \gamma < 50\) (OK)

\[ \theta = \tan^{-1}(10/5) = 63.4^\circ \]
So, \(30^\circ < \theta < 90^\circ\) (OK)

\[ F_y = 500 \text{ MPa} \text{ (OK)} \]

\[ g = 20 \text{ mm} \]
\[
g/D = 20 / 500 = 0.04
\]

**Determination of \( Q_u \)**

First, evaluate \( Q_g \). Since \(-0.05 \leq g/D \leq 0.05\), use linear interpolation.

For \( g/D = 0.05 \):

\[
Q_g = 1 + 0.2 \times (1 - 2.8 \times g/D)^3 = 1 + 0.2 \times (1 - 2.8 \times 0.05)^3 = 1.127
\]

For \( g/D = -0.05 \):

\[
Q_g = 0.13 + 0.65 \times \phi \times \gamma^{0.5} = 0.13 + 0.65 \times (1) \times (12.5)^{0.5} = 2.428
\]

For \( g/D = 0.04 \):

\[
1.127 + (2.428 - 1.127) \times (0.05 - 0.04) / (0.05 - -0.05) = 1.257
\]

**Axial Capacity**

\[
P_a = Q_u Q_f \frac{F_{yc} T^2}{FS \sin \theta} = 29.815(0.9977) \frac{500(20)^2}{1.6 \sin (63.4^\circ)} = 4,158.5 \text{ kN}
\]

**Moment Capacity**

\[
M_a = Q_u Q_f \frac{F_{yc} T^2 d}{FS \sin \theta} = 10.52(1.001) \frac{500(20)^2 400}{1.6 \sin (63.4^\circ) 10^6} = 588.85 \text{ kN} \cdot \text{m}
\]

Out-of-plane bending is zero so moment capacity is not calculated.

**Interaction Ratio**

\[
P/P_a + (M/M_a)^2 = (72.511 / 4,158.5) + (0.727 / 588.85)^2 = 0.017
\]

### V.API Overlapping KJoint - Comp and Bend

Verify the design of an overlapping K joint with axial load, in-plane bending, and out-of-plane bending.

**Details**

Design of node 3 in the following model.
Table 822: Loads

<table>
<thead>

<td>0.727</td>
<td>6.254</td>
</tr>
</tbody>
</table>

**Validation**

Design Parameters

- $\beta = \frac{d}{D} = 0.8$
- So, $0.2 < \beta < 1.0$ (OK)

- $\gamma = \frac{D}{2T} = 12.5$
- So, $10 < \gamma < 50$ (OK)

- $\theta = \tan^{-1}(\frac{10}{5}) = 63.4^\circ$
- So, $30^\circ < \theta < 90^\circ$ (OK)

- $F_y = 500$ MPa (OK)

- $g = -76.2$ mm
\[ g/D = -76.2 / 500 = -0.1524 \]

Determination of \( Q_u \)

First, evaluate \( Q_u \). Since \( g/D < -0.50 \), use linear interpolation.

For \( g/D = -0.05 \):

\[ Q_{u,ax} = (16 + 1.2x\gamma)\times1.2\times Q_g = [16 + 1.2(12.5)](0.8)\times(2.428) = 57.586 \]

\[ Q_{u,ipb} = (5 + 0.7\times\gamma)\times1.2 = [5 + 0.7(12.5)](0.8)\times1.2 = 10.52 \]

\[ Q_{u,opb} = 2.5 + (4.5 + 0.2\times\gamma)\times2.6 = 2.5 + [4.5 + 0.2(12.5)](0.8)\times2.6 = 6.419 \]

Determination of \( Q_f \)

From Table 4.3.2:

\[ C1_{ax} = 0.2, C2_{ax} = 0.2, C3_{ax} = 0.3 \]

\[ C1_{ipb} = 0.2, C2_{ipb} = 0, C3_{ipb} = 0.4 \]

\[ C1_{opb} = 0.2, C2_{opb} = 0, C3_{opb} = 0.4 \]

\[ P_{yc} = A_c\times F_{yc} = 15,079.5 \text{ kN} \]

\[ M_{pc} = Z_c\times F_{yc} = 1,740.19 \text{ kN.m} \]

\[ P_c = 49.99 \text{ kN} \]

\[ M_c = \sqrt{(MIPC^2 + MOPC^2)} = 18.267 \text{ kN.m} \]

\[ A = \sqrt{\left(\frac{FS \times P_c}{P_{yc}}\right)^2 + \left(\frac{FS \times M_c}{M_{pc}}\right)^2} = \sqrt{\left(\frac{1.6 \times 49.99}{17, 079.5}\right)^2 + \left(\frac{1.6 \times 18.267}{1, 740.19}\right)^2} = 0.0176 \]

\[ Q_{f,ax} = 1 + C1_{ax}\left(\frac{FS \times P_c}{P_{yc}}\right) = C2_{ax}\left(\frac{FS \times M_c}{M_{pc}}\right) - C3_{ax}A^2 \]

\[ Q_{f,ipb} = 1 + C1_{ipb}\left(\frac{FS \times P_c}{P_{yc}}\right) = C2_{ipb}\left(\frac{FS \times M_c}{M_{pc}}\right) - C3_{ipb}A^2 \]

\[ Q_{f,opb} = 1 + C1_{opb}\left(\frac{FS \times P_c}{P_{yc}}\right) = C2_{opb}\left(\frac{FS \times M_c}{M_{pc}}\right) - C3_{opb}A^2 \]

Axial Capacity

\[ P_a = Q_u Q_f \frac{F_{yc} T^2}{FS\sin \theta} = 57.586(0.9977)\frac{500(20)^2}{1.6\sin \left(63.4^\circ\right) \times 10^3} = 8, 041.5 \text{ kN} \]

Moment Capacity

In-plane bending:

\[ M_a = Q_u Q_f \frac{F_{yc} T^2 d}{FS\sin \theta} = 10.52(1.001)\frac{500(20)^2400}{1.6\sin \left(63.4^\circ\right) \times 10^6} = 588.85 \text{ kN.m} \]
Out-of-plane bending:

\[ M_a = Q_{u} Q_{f} \frac{E_{yc} T^2_d}{F_S \sin \theta} = 6.419(1.001) \frac{500(20)^2 400}{1.6 \sin(63.4^\circ) 10^6} = 359.31 \text{ kN\cdot m} \]

**Brace Loads**

As axial loads for through and overlapping brace are of different sign, resultant axial load will be that of through brace. (Page 65, API code).

Axial load = 72.511 kN (C)

According to Page 65 of the API code, the resultant in-plane and out-plane bending moments will be algebraic summation of moments of the through brace and overlapping brace.

In-plane moment = 0.727 + (-0.89) = -0.163 kN \cdot m

Out-of-plane moment = 6.254 + 6.254 = 12.508 kN \cdot m

**Interaction Ratio**

\[ P/P_a + (M/M_a)_{ip2} + (M/M_a)_{op} = (72.511 / 8,014.5) + (0.163 / 588.85)^2 + (12.508 / 359.31) = 0.044 \]

Details
Design of node 4 (between members 2 and 5) in the following model.
Chord member (2): $D = 20$ in, $T = 1$ in ($A_c = 59.69$ in$^2$, $Z_c = 361.3$ in$^3$)

Brace member (5): $d = 18$ in, $t = 1$ in ($A_b = 53.41^2$, $Z_b = 289.3^3$)

Brace member 10 overlaps with member 5.

\text{Brace Loads} \\
\text{As axial loads for through and overlapping braces are of different signs, the resultant axial load will be the sum of both brace loads (reference p.65).}
The gap distance, \( g = 4 \text{ in} \) (segment QR).

Angle \( PQR = \theta = 63.4^\circ \)

The loaded segment length (green line PQ) = \( g / \cos(\theta) = 4 / \cos(63.4^\circ) = 8.93 \text{ in} \)

To determine the overlapping portion of the cross section of member 10 (i.e., the green portion of Section A-A), note that line segments OP and OB are equal to the radius of the pipe (use the nominal outer radius), \( r = 6 \text{ in} \).

\[
\cos(\alpha) = \frac{r - PQ}{r} = \frac{6 - 8.93}{6} = -0.489
\]

\[
\alpha = 119.3^\circ = 2.082 \text{ rad}
\]

The arc length (green portion of Section A-A) = \( 2 \times \alpha \times r = 2(2.082)(6) = 25 \text{ in} \)

The proportion of this arc to the total circumference = \( 25 / (2\pi r) = 25 / (2\pi \times 6) = 0.663 \)

So the total axial load is the axial load of the through brace plus this ratio times the axial load of the overlapping brace (axial force values taken from STAAD.Pro post-processing workflow):

\[
322.39 \text{ kip} + 0.663 \times 181.5 \text{ kip} = 442.7 \text{ kip}
\]

According to p.65 of the API code, the resultant in-plane and out-plane bending moments will be algebraic summation of moments of the through brace and overlapping brace. Therefore, the total in-plane moment:

\[
101.72 \text{ in} \cdot \text{kip} + 12.61 \text{ in} \cdot \text{kip} = 114.33 \text{ in} \cdot \text{kip}
\]

Interaction Ratio

\[
P/P_a + (M/M_a)^2 = (442.7 / 1,346.1) + (114.33 / 4,726)^2 = 0.329
\]
## Results

V.API X Joint

Verify the design of a simple X joint with axial load and in-plane bending.

Details

Design of node 3 between members 2 and 6 in the following model.

Chord member (2 & 3): D = 500 mm, T = 20 mm (A<sub>c</sub> = 30,159 mm<sup>2</sup>, Z<sub>c</sub> = 3,480,380 mm<sup>3</sup>)

Brace member (6): d = 475 mm, t = 15 mm (A<sub>b</sub> = 21,677 mm<sup>2</sup>, Z<sub>b</sub> = 2,416,700 mm<sup>3</sup>)
Verification Examples

</tbody>
</table>

Validation

Design Parameters

$\beta = \frac{d}{D} = 0.95$
So, $0.2 < \beta < 1.0$ (OK)

$\gamma = \frac{D}{2T} = 12.5$
So, $10 < \gamma < 50$ (OK)

$\theta = \tan^{-1}(10/5) = 63.4^\circ$
So, $30^\circ < \theta < 90^\circ$ (OK)

$F_y = 500$ MPa (OK)

Determination of $Q_u$

$Q_u = 0.3/[\beta(1 - 0.833\times\beta)] = 1.513$

$Q_{u,ax} = [2.8 + (12 + 0.1\times\gamma)\times\beta]\times Q_u = [2.8 + (12 + 0.1\times12.5)\times0.95](1.513) = 23.289$

$Q_{u,iph} = (5 + 0.7\times\gamma)\times\beta^{1.2} = [5 + 0.7(12.5)](0.95)^{1.2} = 12.929$

$Q_{u,opb} = 2.5 + (4.5 + 0.2\times\gamma)\times\beta^{2.6} = 2.5 + [4.5 + 0.2(12.5)](0.95)^{2.6} = 8.626$

Determination of $Q_f$

From Table 4.3.2:

$C_{1ax} = 0.2, C_{2ax} = 0, C_{3ax} = 0.35$

For $C_1, C_2, \text{and } C_3$, interpolate between values for $\beta \leq 0.9$ and $\beta = 1.0$.

$C_{1b} = 0.2, C_{2b} = 0, C_{3b} = 0.4$

$P_{yc} = A_{c}\times F_{yc} = 15,079.5 \text{ kN}$

$M_{pc} = Z_{c}\times F_{yc} = 1,740.19 \text{ kN·m}$

$P_c = 49.99 \text{ kN}$

$M_c = \sqrt{(\text{MIPC}^2 + \text{MOPC}^2)} = 18.04 \text{ kN·m}$

$A = \sqrt{(FS \times \frac{P_c}{F_{yc}})^2 + (FS \times \frac{M_c}{M_{pc}})^2} = \sqrt{(1.6 \times 49.99)^2 + (1.6 \times 18.04)^2} = 0.0174$

$Q_{f,ax} = 1 + C_{1ax}\left(FS \times \frac{P_c}{F_{yc}}\right) - C_{2ax}\left(FS \times \frac{M_c}{M_{pc}}\right) - C_{3ax}A^2$

$Q_{f,ax} = 1 + 0.2\left(\frac{1.6 \times 49.99}{15,079.5}\right) - 0.35(0.0174)^2 = 1.0$
\[ Q_{f,ipb} = 1 + C_1 b \left( \frac{FS \times P_c}{F_{yc} T^2} \right) - C_2 b \left( \frac{FS \times M_c}{M_{pc}} \right) - C_3 b A^2 \]

\[ Q_{f,ipb} = 1 + 0.2 \left( \frac{1.6 \times 49.99}{15,079.5} \right) - 0 - 0.4 (0.0174)^2 = 1.001 \]

\[ Q_{f,opb} = 1 + C_1 b \left( \frac{FS \times P_c}{F_{yc} T^2} \right) - C_2 b \left( \frac{FS \times M_c}{M_{pc}} \right) - C_3 b A^2 \]

\[ Q_{f,opb} = 1 + 0.2 \left( \frac{1.6 \times 49.99}{15,079.5} \right) - 0 - 0.4 (0.0174)^2 = 1.001 \]

**Axial Capacity**

\[ P_a = Q_u Q_f \frac{F_{yc} T^2}{FS \sin \theta} = 23.289 \left( \frac{500^2}{1.6 \sin (63.4^\circ)} \right)^{1/3} \times 3 = 3,255.7 \text{ kN} \]

**Moment Capacity**

In-plane bending:

\[ M_a = Q_u Q_f \frac{F_{yc} T^2 d}{FS \sin \theta} = 12.929 \left( \frac{500^2}{1.6 \sin (63.4^\circ)} \right)^{2/3} = 858.53 \text{ kN} \cdot \text{m} \]

Out-of-plane bending:

\[ M_a = Q_u Q_f \frac{F_{yc} T^2 d}{FS \sin \theta} = 8.626 \left( \frac{500^2}{1.6 \sin (63.4^\circ)} \right)^{2/3} = 572.8 \text{ kN} \cdot \text{m} \]

**Interaction Ratio**

\[ \frac{P}{P_a} + (M/M_a)_{ipb}^2 + (M/M_a)_{opb} = \frac{66.082}{3,255.7} + \frac{0.921}{858.53} = 0.031 \]

**Results**

Validation

Design Parameters

\[ \beta = \frac{d}{D} = 0.8 \]
So, \( 0.2 < \beta < 1.0 \) (OK)

\[ \gamma = \frac{D}{2T} = 12.5 \]
So, \( 10 < \gamma < 50 \) (OK)

\[ \theta = \tan^{-1}(\frac{10}{5}) = 63.4° \]
So, \( 30° < \theta < 90° \) (OK)

\[ F_y = 500 \text{ MPa} \] (OK)

\[ g = 0 \]

Determination of \( Q_u \)

\[ Q_{u,\text{ax}} = 30 \times \beta = 30(0.8) = 24 \]

\[ Q_{u,\text{ipb}} = (5 + 0.7 \times \gamma) \times \beta^{1.2} = [5 + 0.7(12.5)](0.8)^{1.2} = 10.52 \]

Determination of \( Q_f \)

From Table 4.3.2:

\[ C_{1_{\text{ax}}} = 0.3, C_{2_{\text{ax}}} = 0, C_{3_{\text{ax}}} = 0.8 \]

\[ C_{1_{b}} = 0.2, C_{2_{b}} = 0, C_{3_{b}} = 0.4 \]

\[ P_{yc} = A_c \times F_{yc} = 15,079.5 \text{ kN} \]

\[ M_{pc} = Z_c \times F_{yc} = 1,740.19 \text{ kN·m} \]

\[ P_c = -30 \text{ kN} \]

\[ M_c = \sqrt{(M_{IPC}^2 + M_{OPC}^2)} = 0.49 \text{ kN·m} \]

\[ A = \sqrt{\left(\frac{F_S \times P_c}{P_{yc}}\right)^2 + \left(\frac{F_S \times M_c}{M_{pc}}\right)^2} = \sqrt{\left(\frac{1.6 \times 30}{17,079.5}\right)^2 + \left(\frac{1.6 \times 0.49}{1,740.19}\right)^2} = 0.003 \]

\[ Q_{f,\text{ax}} = 1 + C_{1_{\text{ax}}} \left(\frac{F_S \times P_c}{P_{yc}}\right) - C_{2_{\text{ax}}} \left(\frac{F_S \times M_c}{M_{pc}}\right) - C_{3_{ax}} A^2 \]

\[ Q_{f,\text{ax}} = 1 + 0.3 \left(\frac{1.6 \times 30}{15,079.5}\right) - 0 - 0.8(0.003)^2 = 0.999 \]

\[ Q_{f,\text{bend}} = 1 + C_{1_{b}} \left(\frac{F_S \times P_c}{P_{yc}}\right) - C_{2_{b}} \left(\frac{F_S \times M_c}{M_{pc}}\right) - C_{3_{b}} A^2 \]
\[ Q_{\text{f,bend}} = 1 + 0.2 \left( \frac{1.6 \times 30}{15,079.5} \right) - 0 - 0.4(0.003)^2 = 0.999 \]

**Axial Capacity**

\[ P_a = Q_u Q_f \frac{F_y c T^2}{F_S \sin \theta} = 24(0.999) \frac{500(20)^2}{1.6\sin(63.4^\circ)10^3} = 3,351.8 \text{ kN} \]

**Moment Capacity**

\[ M_a = Q_u Q_f \frac{F_y c T^2 d}{F_S \sin \theta} = 10.52(0.999) \frac{500(20)^2 400}{1.6\sin(63.4^\circ)10^6} = 587.9 \text{ kN}\cdot\text{m} \]

Out-of-plane bending is zero so moment capacity is not calculated.

**Interaction Ratio**

\[ \frac{P}{P_a} + (\frac{M}{M_a})^2 = \left( \frac{33.34}{3,351.8} \right) + \left( \frac{0.49}{587.9} \right)^2 = 0.010 \]

**Results**

### V. ASME NF 3000 Codes

### V. ASME NF 3000 1974 Angle

Verify the allowable stress and critical ratio of the brace members in a frame using the ASME NF 3000 1974 code.

#### Details

The forces due to loading in member 6 is 2,666.18 lbs (tension) and in member 7 is 7,104.23 lbs (compression). Members 6 and 7 are “truss” members (axial-only).
Both member 6 and 7 are L 80x60x10, grade A36 steel ($F_y = 36$ ksi, $F_u = 58$ ksi).
Assume a net section factor of 0.9, an effective length factor of 0.85, and $C_t = 0.9$.

**Validation**

$$L = \sqrt{5^2 + 6^2}(12\text{in/ft}) = 93.726\text{in}$$

Slenderness ratio (same for both members) using the minimum value of $r$: $kL/r_z = 0.85(93.726)/1.29 = 61.76$

For member 6, $kL/r_z = 61.76 < 300$

For member 7, $kL/r_z = 61.76 < 200$

**Axial Tension: Member 6 (per NF-74.2211)**

Corrected area, $A_c = C_t \times A_x = 7.57 \text{in}^2$

Actual tensile stress = $P/A = 2,666.18 / 7.57 = 352.2 \text{psi}$

Allowable tensile stress (Tension capacity) = $0.6 \times F_y = 0.6 \times 36 = 21.6 \text{ksi}$

Critical ratio = $352.2/21,600 = 0.016$

**Axial Compression: Member 7 (NF-74.2213):**

Actual compressive stress $= P/A = 7,104.23 / 8.41 = 844.74 \text{psi}$

$$C'_c = \sqrt{\frac{2n^2 E}{Q_s Q_{a'} F_y}} = 126.2$$

(NF-3322.2(e)(5))

$$(kL/r)_{min} < C'_c$; allowable compression stress, $F_a = 17.2 \text{ksi}$

Critical ratio = $844.74 / 17,200 = 0.049$

Related Links
- D1.L.1. ASME NF 3000 - 1974 & 1977 Codes (on page 1303)

V. ASME NF 3000 1974 Channel

Verify the design of channel section used for a beam member using the ASME NF 3000 1974 code.
Details

The beam is a propped cantilever 80 inches long. The beam is loaded with a 2 kip concentrated load at midspan and a uniformly distributed load of 1 kip/in over the entire length.

The member is C15x50 channel section with Grade A36 steel.

Validation

Maximum shear force (at fixed end): \( V = 51.375 \) kips (taken from STAAD.Pro analysis)

Maximum moment (at fixed end): \( M = 830.0 \) in-kip (taken from STAAD.Pro analysis)

Slenderness Ratio

About z-axis: \( (KL/r)_z = 0.85(80 \text{ in})/(5.25 \text{ in}) = 12.95 \)

About y-axis: \( (KL/r)_y = 0.85(80 \text{ in})/(0.865 \text{ in}) = 78.61 \)

Max. slenderness ratio < 300, OK.

Bending About Major Axis (Z Axis)

\[
\frac{b_f}{t_f} = 4.62 < \frac{65}{\sqrt{F_y}} = 10.83
\]

The laterally unsupported length of the compression flange, \( L_b = 80 < \frac{76b_f}{F_y} = 120 \)

and \( < \frac{20,000}{(d/A_f)F_y} = 89.56 \)

As \( b_f/t_f \) is not in the range of \( 65/\sqrt{F_y} \) and \( 95/\sqrt{F_y} \), the value of allowable bending compressive and tensile stress = \( F_{bty} = F_{bcy} = 0.6 \times F_y = 21.6 \) ksi

Actual bending stress:

Bending Tensile Stress = bending compressive stress = \( f_{btz} = f_{bcz} = MzD / (2I_z) = 15.4 \) ksi

Critical ratio = 15.41 ksi / 21.6 ksi = 0.713

Shear

Actual shear:

\[
F_y = 51.375 \text{ kips}
\]

\[
V_y = D \times t_w = 10.8 \text{ in}^2
\]

\[
f_{v,y} = F_y/V_y = 4.76 \text{ ksi}
\]

Allowable shear:

\( a = \) clear distance between transverse stiffeners (here taken as length) = 80 in

\( h = \) clear distance flanges of the girder = \( D - 2t_f = 14.35 \) in

Thus, \( a/h = 5.57, \) Therefore, \( k = 5.34 + [4.00 / (a/h)^2] = 5.46 \)

\[
t = t_w = 0.72 \text{ inch}
\]

\( Cv = 17.2 \)
\[ F_v = \left( \frac{F_y}{2.89} \right) C_v \geq 0.4 \times F_y = 14.4 \text{ ksi} \]

Hence allowable = 14.4 ksi

Therefore, \( \frac{f_v}{F_v} = 0.330 \)

Verification Examples

V. ASME NF 3000 1974 Pipe

Verify the design of a pipe section used for a beam member per the ASME NF 3000 1974 code.

Details

The simply supported beam is 50 inches long. The beam is loaded with a 1.5 kip concentrated load at midspan and a uniformly distributed load of 1 kip/in over the entire length.

The member is PIPS 120 pipe section with Grade A36 steel.
**Validation**

Maximum shear force, \( V = \frac{P}{2} + \frac{wL}{2} = \frac{1.5}{2} + \frac{1.0(50)}{2} = 25.75 \text{kips} \)

Maximum moment, \( M = \frac{PL}{4} + \frac{wL^2}{8} = \frac{1.5(50)}{4} + \frac{1.0(50)^2}{8} = 331.25 \text{in} \cdot \text{kip} \)

Slenderness ratio = \( (KL/r) = 9.72 < 300 \)

**Bending About Major Axis (Z-Axis)**

Section is compact: \( \frac{OD}{t} = 36.43 < \frac{3.300}{F_y} = 91.67 \)

Allowable bending stress: \( F_b = 0.66 \times F_y = 23.76 \text{ksi} \)

Actual bending stress: \( f_{bz} = f_{bcz} = \frac{M_z}{I_z} \left( \frac{OD^2}{2} \right) = \frac{331.25 \left( \frac{12.75}{2} \right)}{262} = 8.06 \text{ksi} \)

Stress ratio: 0.339

**Shear**

From the reference, the shear area:

\[
A_y = \frac{0.25 \pi (r_2^4 - r_1^4)}{2 (r_2^3 - r_1^3)}
\]

where

\[
\begin{align*}
r_1 &= \text{inner radius} \\
r_2 &= \text{outer radius}
\end{align*}
\]

Shear area: \( A_y = 6.8 \text{ in}^2 \)

Actual shear stress (at supports): \( f_v = 25.75 / 6.8 = 3.78 \text{ ksi} \)

Actual shear stress (at midspan): \( f_v = 0.75 / 6.8 = 0.110 \text{ ksi} \)

Allowable shear stress, \( F_v = 0.4 \times F_y = 14.4 \text{ ksi} \)

Stress ratio: 3.78/14.4 = 0.263

**Results**

**Verification Examples**

**V. ASME NF 3000 1974 Tee**

Verify the design of a pipe section used for a beam member per the ASME NF 3000 1974 code.

**Details**

A cantilever beam is 60 in long. The beam is loaded at the free end with a 2 kip load and a uniform load of 1 kip/in along the entire length.

The member is a WT18x67.5 section with Grade A36 steel.

**Validation**

Maximum shear force (at support) = $V = wL + P = (1 \text{ kip/in}) \times 60 \text{ in} + 2 \text{ kip} = 62 \text{ kips}$

Maximum moment (at support) = $M = 0.5\times w\times L^2 + P\times L = 0.5 \times (1 \text{ kip/in})\times(60 \text{ in})^2 + (2 \text{ kip})\times(60 \text{ in}) = 1,920 \text{ in.kips}$

Slenderness Ratio

- Slenderness Ratio along Z-Axis = $(KL/r)_z = 21.22$
- Slenderness Ratio along Y-Axis = $(KL/r)_y = 50.53$

Maximum Slenderness Ratio = $50.53 < 300$

**Bending**

Allowable Bending Stress About Major Axis (Z Axis)

\[
\frac{b}{2t_f} = 4.65 > 65/\sqrt{(F_Y)} = 10.833
\]

\[
d/t_w = 28.3 < 640/\sqrt{(F_Y)} = 106.67
\]
Thus allowable bending stress is obtained by treating the section as compact.

\[ F_b = 0.66 \times F_Y = 23.8 \text{ ksi} \]

**Actual Bending Stress**

- Bending Tensile Stress: \( f_{btz} = (M_z/I_z) \times Y_{bar} = 14.93 \text{ ksi} < 23.8 \text{ ksi} \)
- Bending Compressive Stress: \( f_{bcz} = 38.7 \text{ ksi} > 23.8 \text{ ksi} \)
- Critical stress ratio: \( 38.7 \text{ ksi} / 23.8 \text{ ksi} = 1.626 \)

**Shear**

- Allowable Shear Stress
- \( a = \text{clear distance between transverse stiffeners (here taken as length)} = 60 \text{ in} \)
- \( h = \text{clear distance flanges of the girder} = D-t_f = 17.01 \text{ in} \)
- Thus, \( a/h = 3.527 \) Therefore, \( k = 5.34 + \left[ 4.00 / (a/h)^2 \right] = 5.65 \)
- \( t = t_w = 0.44 \text{ inch} \)
- If \( Cv > 0.8 \), \( Cv = \left[ 190 / (h/t) \right] \sqrt{(h/S_y)} = 78.4 \) which is true. Thus, the value of \( Cv \) is taken as 78.4
- Allowable shear stress: \( F_v = (FY/2.89)Cv \leq 0.4F_y = 14.4 \text{ ksi} \)
- Hence allowable shear = 14.4ksi

**Actual Shear**

- \( V_y = D t_w = 10.68 \text{ in}^2 \)
- \( f_v = F_y/V_y = 5.805 \text{ ksi} \)
- Stress ratio: \( f_v/F_v = 0.403 \)

---
Verifying the design of a wide-flange section used for a cantilever beam using the ASME NF 3000 1974 code.

**Details**

The beam is a 10 ft cantilever with a 12.5 kip concentrated load at the free end.

The member is a W16X40 section with Grade A36 steel.

**Validation**

Maximum shear force (constant shear): \( V = 12.5 \text{ kips} \)

Maximum moment (at fixed end): \( M = 12.5 \text{ kips} \times 120 \text{ in} = 1,500 \text{ in} \cdot \text{kips} \)

Slenderness Ratio

\((KL/r_z) = \text{Slenderness Ratio along Z-Axis} = 18.11\)

\((KL/r_y) = \text{Slenderness Ratio along Y-Axis} = 76.68\)

Maximum Slenderness Ratio = 76.68 < 240 (Hence OK)

**Bending about Major Axis (Z Axis)**

Allowable Bending Stress

\[ \frac{b_f t_f}{2t_f} = 6.862 < 65/(F_y)^{0.5} \] [Ref. NF3322.1(d)(2)]

Thus, allowable bending tensile stress \( = F_{btz} = F_y \times 0.79-0.002 \times (b_f/2t_f) \times \sqrt{F_y} = 25.47 \text{ ksi} \)

Actual Bending Stress

Bending Tensile Stress = Bending Compressive Stress \( = f_{btz} = f_{bcz} = M_z D / 2I_z = 23.17 \text{ ksi} \)

Stress ratio \( = 23.16 \text{ ksi} / 25.47 \text{ ksi} = 0.909 \)

**Shear**

Allowable Shear Stress

\( a = \text{clear distance between transverse stiffeners (here taken as length)} = 120 \text{ in} \)
h = clear distance flanges of the girder = \( D - 2t_f = 14.91 \text{ in} \)  

Thus,  \( a/h = 8.05 \), Therefore,  \( k = 5.34 + [4.00 / (a/h)^2] = 5.36 \) [Ref. NF3322.6(e)(2) ]

\[ t = t_w = 0.3 \text{ inch} \]

\[ Cv = 1.475 \]

Allowable shear stress  \( F_v = (F_y / 2.89)Cv = > 0.4F_y = 14.4 \text{ ksi} \) Hence allowable = 14.4 ksi

Actual Shear Stress  

\[ F_y = 12.5 \text{ kip}, \ V_y = D t_w = 4.8 \text{ inch}^2 \]

\[ f_v = F_y/V_y = 2.6 \text{ ksi} \]

Stress ratio  \( f_v/F_v = 0.18 \)

- [D1.L.1. ASME NF 3000 - 1974 & 1977 Codes](#) (on page 1303)

V. ASME NF 3000 1977 Angle

Verify the allowable stress and critical ratio of the brace members in a frame using the ASME NF 3000 1977 code.
**Details**

The forces due to loading in member 6 is 2,666.18 lbs (tension) and in member 7 is 7,104.23 lbs (compression). Members 6 and 7 are “truss” members (axial-only).

Both member 6 and 7 are L 80x60x10, grade A36 steel ($F_y = 36 \text{ ksi}, F_u = 58 \text{ ksi}$). Assume a net section factor of 0.9, an effective length factor of 0.85, and $C_t = 0.9$.

**Validation**

\[ L = \sqrt{5^2 + 6^2} (12 \text{ in/ft}) = 93.726 \text{ in} \]

Slenderness ratio (same for both members) using the minimum value of $r$: $kL/r_z = 0.85(93.726)/1.29 = 61.76$

For member 6, $kL/r_z = 61.76 < 300$

For member 7, $kL/r_z = 61.76 < 200$

**Axial Tension: Member 6 (per NF-77.2211)**

Corrected area, $A_c = C_t \times A_x = 7.57 \text{ in}^2$

Actual tensile stress = $P/A = 2,666.18 / 7.57 = 352.2 \text{ psi}$

Allowable tensile stress (Tension capacity) = $0.6 \times F_y = 0.6 \times 36 = 21.6 \text{ ksi}$

Critical ratio = $352.2/21,600 = 0.016$

**Axial Compression: Member 7 (NF-77.2213)**

Actual compressive stress = $P/A = 7,104.23 / 8.41 = 844.74 \text{ psi}$

\[ C_c' = \sqrt{\frac{2n^2E}{Q_s Q_a F_y}} = 126.2 \quad \text{ (NF-3322.2(e)(5) )} \]
(kL/r)_{\text{min}} < C_{\text{c'}}, \text{ allowable compression stress, } F_{\text{a}} = 17.2 \text{ ksi}

Critical ratio = \frac{844.74}{17,200} = 0.049

Related Links
• D1.L.1. ASME NF 3000 - 1974 & 1977 Codes (on page 1303)
V. ASME NF 3000 1977 Channel

Verify the design of channel section used for a beam member using the ASME NF 3000 1977 code.

Details

The beam is a propped cantilever 80 inches long. The beam is loaded with a 2 kip concentrated load at midspan and a uniformly distributed load of 1 kip/in over the entire length.

The member is C15x50 channel section with Grade A36 steel.

Validation

Maximum shear force (at fixed end): \( V = 51.375 \text{ kips} \) (taken from STAAD.Pro analysis)

Maximum moment (at fixed end): \( M = 830.0 \text{ in-kip} \) (taken from STAAD.Pro analysis)

Slenderness Ratio

About z-axis: \( (KL/r)_z = 0.85(80 \text{ in})/(5.25 \text{ in}) = 12.95 \)

About y-axis: \( (KL/r)_y = 0.85(80 \text{ in})/(0.865 \text{ in}) = 78.61 \)

Max. slenderness ratio < 300, OK.

Bending About Major Axis (Z Axis)

\[
\frac{b_f}{t_f} = 4.62 < \frac{65}{\sqrt{F_y}} = 10.83
\]

The laterally unsupported length of the compression flange, \( L_b = 80 < \frac{76b_f}{\sqrt{F_y}} = 120 \)

and \( < \frac{20, 000}{(d/A_f)F_y} = 89.56 \)

As \( b_f/t_f \) is not in the range of \( 65/\sqrt{F_y} \) and \( 95/\sqrt{F_y} \), the value of allowable bending compressive and tensile stress = \( F_{bty} = F_{bcy} = 0.6\times F_y = 21.6 \text{ ksi} \)

Actual bending stress:

Bending Tensile Stress = bending compressive stress = \( f_{btz} = f_{bcz} = \frac{MzD}{2I_z} = 15.4 \text{ ksi} \)

\[
830.0 \text{ (15.0)} / (2 \times 404) = 15.41 \text{ ksi}
\]

Critical ratio = 15.41 ksi / 21.6 ksi = 0.713

Shear

Actual shear:

\( F_y = 51.375 \text{ kips} \)

\( V_y = D\times t_w = 10.8 \text{ in}^2 \)

\( f_{v,y} = F_y/V_y = 4.76 \text{ ksi} \)

Allowable shear:

\( a = \) clear distance between transverse stiffeners (here taken as length) = 80 in

\( h = \) clear distance flanges of the girder = \( D - 2t_f = 14.35 \text{ in} \)

Thus, \( a/h = 5.57 \), Therefore, \( k = 5.34 + [4.00/ (a/h)^2] = 5.46 \)
\[ t = t_w = 0.72 \text{ inch} \]

\[ C_v = 17.2 \]

\[ F_v = (F_y/2.89)C_v \geq 0.4 \times F_y = 14.4 \text{ ksi} \]

Hence allowable = 14.4 ksi

Therefore, \[ \text{Ratio} = \frac{f_v}{F_v} = 0.330 \]

- D1.L.1. ASME NF 3000 - 1974 & 1977 Codes (on page 1303)

V. ASME NF 3000 1977 Pipe

Verify the design of a pipe section used for a beam member per the ASME NF 3000 1977 code.
Details
The simply supported beam is 50 inches long. The beam is loaded with a 1.5 kip concentrated load at midspan and a uniformly distributed load of 1 kip/in over the entire length.
The member is PIPS 120 pipe section with Grade A36 steel.

Validation

Maximum shear force, \( V = \frac{P}{2} + \frac{wL}{2} = \frac{1.5}{2} + \frac{1.0(50)}{2} = 25.75 \text{kips} \)

Maximum moment, \( M = \frac{PL}{4} + \frac{wL^2}{8} = \frac{1.5(50)}{4} + \frac{1.0(50)^2}{8} = 331.25 \text{in} \cdot \text{kip} \)

Slenderness ratio = \((KL/r) = 9.72 < 300\)

Bending About Major Axis (Z-Axis)

Section is compact: \( \frac{OD}{t} = 36.43 < 3 \times \frac{300}{F_y} = 91.67\)

Allowable bending stress: \( F_b = 0.66 \times F_y = 23.76 \text{ksi} \)

Actual bending stress: \( f_{btz} = f_{bcz} = \frac{M}{T_z} \left( \frac{OD}{2} \right) = \frac{331.25}{262} \left( \frac{12.75}{2} \right) = 8.06 \text{ksi} \)

Stress ratio: 0.339

Shear

From the reference, the shear area:

\[ A_y = \frac{0.25n(r_2^4 - r_1^4)2(r_2 \cdot r_1)}{r_2^3(r_2^3 - r_1^3)} \]

where

\( r_1 \) = inner radius

\( r_2 \) = outer radius

Shear area: \( A_y = 6.8 \text{ in}^2 \)

Actual shear stress (at supports): \( f_v = 25.75 / 6.8 = 3.78 \text{ ksi} \)

Actual shear stress (at midspan): \( f_v = 0.75 / 6.8 = 0.110 \text{ ksi} \)

Allowable shear stress, \( F_v = 0.4 \times F_y = 14.4 \text{ ksi} \)

Stress ratio: \( 3.78/14.4 = 0.263 \)

- [D1.L.1. ASME NF 3000 - 1974 & 1977 Codes](on page 1303)

V. ASME NF 3000 1977 Tee

Verify the design of a pipe section used for a beam member per the ASME NF 3000 1977 code.

**Details**

A cantilever beam is 60 in long. The beam is loaded at the free end with a 2 kip load and a uniform load of 1 kip/in along the entire length.

The member is a WT18x67.5 section with Grade A36 steel.

**Validation**

Maximum shear force (at support) \( V = wL + P = (1 \text{ kip/in}) \times 60 \text{ in} + 2 \text{ kip} = 62 \text{ kips} \)

Maximum moment (at support) \( M = 0.5 \times w \times L^2 + P \times L = 0.5 \left( 1 \text{ kip/in} \right) \times \left( 60 \text{ in} \right)^2 + (2 \text{ kip}) \times (60 \text{ in}) = 1,920 \text{ in kips} \)
**Slenderness Ratio**

Slenderness Ratio along Z-Axis = \((KL/r)_z = 21.22\)

Slenderness Ratio along Y-Axis = \((KL/r)_y = 50.53\)

Maximum Slenderness Ratio = 50.53 < 300

**Bending**

Allowable Bending Stress About Major Axis (Z Axis)

\[ h'd/2t = 4.65 > 65/\sqrt{(F_Y)} = 10.833 \]

\[ d/t_w = 28.3 < 640/\sqrt{(F_Y)} = 106.67 \]

Thus allowable bending stress is obtained by treating the section as compact.

\[ F_b = 0.66 \times F_Y = 23.8 \text{ ksi} \]

Actual Bending Stress

Bending Tensile Stress = \(f_{btz} =(Mz/Iz) \times \bar{Y} = 14.93 \text{ ksi} < 23.8 \text{ ksi}\)

Bending Compressive Stress = \(f_{bcz} = 38.7 \text{ ksi} > 23.8 \text{ ksi}\)

Critical stress ratio = 38.7 ksi / 23.8 ksi = 1.626

**Shear**

Allowable Shear Stress

a = clear distance between transverse stiffeners (here taken as length) = 60 in

h = clear distance flanges of the girder = \(D-t = 17.01 \text{ in}\)

Thus, \(a/h = 3.527\) Therefore, \(k = 5.34 + \left[4.00/ (a/h)^2\right] = 5.65\)

\[ t = t_w = 0.44 \text{ inch} \]

If \(Cv > 0.8, Cv = \left[190/(h/t)\right] \sqrt{h/Sy} = 78.4\) which is true. Thus, the value of \(Cv\) is taken as 78.4

Allowable shear stress = \(F_v = (FY/2.89)Cv \leq 0.4F_Y = 14.4 \text{ ksi}\)

Hence allowable shear =14.4ksi

Actual Shear

\[ V_y = D t_w = 10.68 \text{ in}^2 \]

\[ f_v = F_y/V_y = 5.805 \text{ ksi} \]

Stress ratio = \(f_v/F_v = 0.403\)

### Related Links

## V. ASME NF 3000 1977 WShaped

Verify the design of a wide-flange section used for a cantilever beam using the ASME NF 3000 1977 code.

### Details

The beam is a 10 ft cantilever with a 12.5 kip concentrated load at the free end.

The member is a W16X40 section with Grade A36 steel.

### Validation

**Maximum shear force (constant shear):** $V = 12.5 \text{ kips}$

**Maximum moment (at fixed end):** $M = 12.5 \text{ kips} \times 120 \text{ in} = 1,500 \text{ in \cdot kips}$

**Slenderness Ratio**

$(KL/r)_x = \text{Slenderness Ratio along } Z\text{-Axis} = 18.11$

$(KL/r)_y = \text{Slenderness Ratio along } Y\text{-Axis} = 76.68$

Maximum Slenderness Ratio = 76.68 < 240 (Hence OK)

**Bending about Major Axis (Z Axis)**

Allowable Bending Stress
Thus, allowable bending tensile stress \( F_{btz} = F_{y}\times\left\{0.79-0.002\times\left(b_f/2t\right)\times\sqrt{F_y}\right\} = 25.47 \text{ ksi} \)

Actual Bending Stress

Bending Tensile Stress = Bending Compressive Stress = \( f_{btz} = f_{bcz} = M_cD/2I_c = 23.17 \text{ ksi} \)

Stress ratio = 23.16 ksi / 25.47 ksi = 0.909

Shear

Allowable Shear Stress

\[ a = \text{clear distance between transverse stiffeners (here taken as length)} = 120 \text{ in} \]
\[ h = \text{clear distance flanges of the girder} = D-2t_f = 14.91 \text{ in} \]

Thus, \( a/h = 8.05 \), Therefore, \( k = 5.34 + \frac{4.00}{(a/h)^2} = 5.36 \) [Ref. NF3322.6(e)(2) ]

\[ t = t_w = 0.3 \text{ inch} \]
\[ C_v = 1.475 \]

Allowable shear stress = \( F_v = (F_y/2.89)C_v = > 0.4F_y = 14.4 \text{ ksi} \) Hence allowable=14.4ksi

Actual Shear Stress

\[ F_y = 12.5 \text{ kip, } V_y = Dt_w = 4.8 \text{ inch}^2 \]
\[ f_v = F_y/V_y = 2.6 \text{ ksi} \]

Stress ratio = \( f_v/F_v = 0.18 \)

Verification Examples
V.09 Steel Design
V. ASME NF 3000 1989 Angle

Verify the allowable stress and critical ratio of the brace members in a frame using the ASME NF 3000 1989 code.

Details

The forces due to loading in member 6 is 2,666.18 lbs (tension) and in member 7 is 7,104.23 lbs (compression). Members 6 and 7 are “truss” members (axial-only).

![Figure 502: Space frame subjected to static loads](image)

Both member 6 and 7 are L 80x60x10, grade A36 steel ($F_y = 36 \text{ ksi}, F_u = 58 \text{ ksi}$). Assume a net section factor of 0.9, an effective length factor of 0.85, and $C_t = 0.9$.

Validation

$$L = \sqrt{5^2 + 6^2} \text{(12in/ft)} = 93.726\text{in}$$

Slenderness ratio (same for both members) using the minimum value of $r$: $kL/r_z = 0.85(93.726)/1.29 = 61.76$

For member 6, $kL/r_z = 61.76 < 300$

For member 7, $kL/r_z = 61.76 < 200$

Axial Tension: Member 6 (per NF-89.1.a)
Corrected area, $A_c = C_t \times A_x = 7.57 \text{ in}^2$

Actual tensile stress $= \frac{P}{A} = \frac{2,666.18}{7.57} = 352.2 \text{ psi}$

Allowable tensile stress (Tension capacity) $= 0.6 \times F_y = 0.6 \times 36 = 21.6 \text{ ksi}$

Critical ratio $= 352.2/21,600 = 0.016$

Axial Compression: Member 7 (NF-89.1c):

Actual compressive stress $= \frac{P}{A} = \frac{7,104.23}{8.41} = 844.74 \text{ psi}$

$$C'_c = \sqrt{\frac{2\pi^2 E}{Q_s Q_a F_y}} = 126.2$$

$(kL/r)_{min} < C'_c$, allowable compression stress, $F_a = 17.2 \text{ ksi}$

Critical ratio $= 844.74 / 17,200 = 0.049$

V. ASME NF 3000 1989 Channel

Verify the design of channel section used for a beam member using the ASME NF 3000 1989 code.

Details

The beam is a propped cantilever 80 inches long. The beam is loaded with a 2 kip concentrated load at midspan and a uniformly distributed load of 1 kip/in over the entire length.

The member is C15x50 channel section with Grade A36 steel.

Validation

Maximum shear force (at fixed end): \( V = 51.375 \) kips (taken from STAAD.Pro analysis)

Maximum moment (at fixed end): \( M = 830.0 \) in-kip (taken from STAAD.Pro analysis)

Slenderness Ratio

About z-axis: \( \frac{(KL/r)_z}{2} = 0.85(80 \text{ in})/(5.25 \text{ in}) = 12.95 \)

About y-axis: \( \frac{(KL/r)_y}{2} = 0.85(80 \text{ in})/(0.865 \text{ in}) = 78.61 \)

Max. slenderness ratio < 300, OK.

Bending About Major Axis (Z Axis)

\[
\frac{b_f}{t_f} = 4.62 < \frac{65}{\sqrt{F_y}} = 10.83
\]

The laterally unsupported length of the compression flange, \( L_b = 80 < \frac{76b_f}{(d/A_f)F_y} = 120 \)

and \( < \frac{200,000}{(d/A_f)F_y} = 89.56 \)

As \( b_f/t_f \) is not in the range of \( 65/\sqrt{F_y} \) and \( 95/\sqrt{F_y} \), the value of allowable bending compressive and tensile stress = \( F_{bty} = F_{bcy} = 0.6F_y = 21.6 \) ksi

Actual bending stress:

Bending Tensile Stress = bending compressive stress = \( f_{btz} = f_{bcz} = \frac{MzD}{(2I_z)} = 15.4 \) ksi

\[ 830.0 \text{ (15.0)} / (2 \times 404) = 15.41 \text{ ksi} \]

Critical ratio = 15.41 ksi / 21.6 ksi = 0.713

Shear
Actual shear:

\[ F_y = 51.375 \text{ kips} \]
\[ V_y = D \times t_w = 10.8 \text{ in}^2 \]
\[ f_{v,y} = \frac{F_y}{V_y} = 4.76 \text{ ksi} \]

Allowable shear:

a = clear distance between transverse stiffeners (here taken as length) = 80 in

h = clear distance flanges of the girder = \( D - 2t_f = 14.35 \text{ in} \)

Thus, \( a/h = 5.57 \), Therefore, \( k = 5.34 + \frac{4.00}{(a/h)^2} = 5.46 \)

\[ t = t_w = 0.72 \text{ inch} \]

\[ C_v = 17.2 \]
\[ F_v = (F_y/2.89)C_v \geq 0.4 \times F_y = 14.4 \text{ ksi} \]

Hence allowable = 14.4 ksi

Therefore, Ratio \( = \frac{f_{v,y}}{F_v} = 0.330 \)

V. ASME NF 3000 1989 Pipe

Verify the design of a pipe section used for a beam member per the ASME NF 3000 1989 code.

Details

The simply supported beam is 50 inches long. The beam is loaded with a 1.5 kip concentrated load at midspan and a uniformly distributed load of 1 kip/in over the entire length.

The member is PIPS 120 pipe section with Grade A36 steel.

Validation

Maximum shear force, \( V = \frac{P}{2} + \frac{wL}{2} = \frac{1.5}{2} + \frac{1.0(50)}{2} = 25.75 \text{kips} \)

Maximum moment, \( M = \frac{PL^4}{4} + \frac{wL^2}{8} = \frac{1.5(50)^4}{4} + \frac{1.0(50)^2}{8} = 331.25 \text{in} \cdot \text{kip} \)

Slenderness ratio = \( (KL/r) = 9.72 < 300 \)

Bending About Major Axis (Z-Axis)

Section is compact: \( \frac{OD}{t} = 36.43 < \frac{3}{F_y} = 91.67 \)

Allowable bending stress: \( F_b = 0.66 \times F_y = 23.76 \text{ksi} \)

Actual bending stress: \( f_{bz} = f_{bcz} = \frac{M}{I_z} \left( \frac{OD}{2} \right) = \frac{331.25}{262} \left( \frac{12.75}{2} \right) = 8.06 \text{ksi} \)

Stress ratio: 0.339

Shear

From the reference, the shear area:
\[
A_y = \frac{0.25\pi(r_2^4 - r_1^4)2(r_2 \cdot r_1)}{2(3r_2^3 - r_1^3)}
\]

where:
\[
\begin{align*}
r_1 & = \text{inner radius} \\
r_2 & = \text{outer radius}
\end{align*}
\]

Shear area: \( A_y = 6.8 \text{ in}^2 \)

Actual shear stress (at supports): \( f_v = 25.75 / 6.8 = 3.78 \text{ ksi} \)

Actual shear stress (at midspan): \( f_v = 0.75 / 6.8 = 0.110 \text{ ksi} \)

Allowable shear stress, \( F_v = 0.4 \times F_y = 14.4 \text{ ksi} \)

Stress ratio: 3.78/14.4 = 0.263
## Results

Verification Examples

V. ASME NF 3000 1989 Tee

Verify the design of a pipe section used for a beam member per the ASME NF 3000 1989 code.

Details

A cantilever beam is 60 in long. The beam is loaded at the free end with a 2 kip load and a uniform load of 1 kip/in along the entire length.

The member is a WT18x67.5 section with Grade A36 steel.

Validation

Maximum shear force (at support) = \( V = wL + P = (1 \text{ kip/in}) \times 60 \text{ in} + 2 \text{ kip} = 62 \text{ kips} \)

Related Links

- [D1.L.2. ASME NF 3000 - 1989 Code](on page 1312)
Maximum moment (at support) \( M = 0.5 \times w \times L^2 + P \times L = 0.5 \times (1 \text{kip/in}) \times (60 \text{in})^2 + (2 \text{kip}) \times (60 \text{in}) = 1,920 \text{in·kips} \)

Slenderness Ratio

Slenderness Ratio along Z-Axis \( (KL/r)_z = 21.22 \)

Slenderness Ratio along Y-Axis \( (KL/r)_y = 50.53 \)

Maximum Slenderness Ratio \( = 50.53 < 300 \)

Bending

Allowable Bending Stress About Major Axis (Z Axis)

\[
\frac{bh}{2t_f} = 4.65 > 65/\sqrt{F_Y} = 10.833
\]

\[
d/t_w = 28.3 < 640/\sqrt{F_Y} = 106.67
\]

Thus allowable bending stress is obtained by treating the section as compact.

\[
F_b = 0.66 \times F_Y = 23.8 \text{ksi}
\]

Actual Bending Stress

Bending Tensile Stress \( f_{btz} = (Mz/Iz) \times Y_{bar} = 14.93 \text{ksi} < 23.8 \text{ksi} \)

Bending Compressive Stress \( f_{bcz} = 38.7 \text{ksi} > 23.8 \text{ksi} \)

Critical stress ratio \( = 38.7 \text{ksi} / 23.8 \text{ksi} = 1.626 \)

Shear

Allowable Shear Stress

\[
a = \text{clear distance between transverse stiffeners (here taken as length)} = 60 \text{in}
\]

\[
h = \text{clear distance flanges of the girder} = D - t_f = 17.01 \text{in}
\]

Thus, \( a/h = 3.527 \) Therefore, \( k = 5.34 + \left[\frac{4.00}{(a/h)^2}\right] = 5.65 \)

\[
t = t_w = 0.44 \text{ inch}
\]

If \( C_v > 0.8, C_v = \left[\frac{190}{(h/t)}\right] \sqrt{(k/S_y)} = 78.4 \) which is true. Thus, the value of \( C_v \) is taken as 78.4

Allowable shear stress \( = F_v = (F_Y/2.89)C_v \leq 0.4F_Y = 14.4 \text{ksi} \)

Hence allowable shear = 14.4ksi

Actual Shear

\[
V_y = D t_w = 10.68 \text{in}^2
\]

\[
f_v = F_y/V_y = 5.805 \text{ksi}
\]

Stress ratio \( = f_v/F_v = 0.403 \)

---
Verify the design of a wide-flange section used for a cantilever beam using the ASME NF 3000 1989 code.

**Details**

The beam is a 10 ft cantilever with a 12.5 kip concentrated load at the free end.

The member is a W16X40 section with Grade A36 steel.

**Validation**

Maximum shear force (constant shear): \( V = 12.5 \text{ kips} \)

Maximum moment (at fixed end): \( M = 12.5 \text{ kips} \times 120 \text{ in} = 1,500 \text{ in kips} \)

**Slenderness Ratio**

\( (KL/r)_z = \text{Slenderness Ratio along Z-Axis} = 18.11 \)

\( (KL/r)_y = \text{Slenderness Ratio along Y-Axis} = 76.68 \)

Maximum Slenderness Ratio = 76.68 < 240 (Hence OK)
Bending about Major Axis (Z Axis)

Allowable Bending Stress

\[ \frac{b f}{2t} f = 6.862 < \frac{65}{(F_y)^{0.5}} \text{ [Ref. NF3322.1(d)(2)]} \]

Thus, allowable bending tensile stress \( F_{btz} = F_y \times [0.79 - 0.002 \times (b_f/2t_f) \times \sqrt{F_y}] = 25.47 \text{ ksi} \)

Actual Bending Stress

Bending Tensile Stress = Bending Compressive Stress \( f_{btz} = f_{bcz} = M_z D / 2I_z = 23.17 \text{ ksi} \)

Stress ratio = 23.16 ksi / 25.47 ksi = 0.909

Shear

Allowable Shear Stress

\( a = \text{clear distance between transverse stiffeners (here taken as length)} = 120 \text{ in} \)
\( h = \text{clear distance flanges of the girder} = D - 2t_f = 14.91 \text{ in} \)

Thus, \( a/h = 8.05 \), Therefore, \( k = 5.34 + [4.00/ (a/h)^2] = 5.36 \text{ [Ref. NF3322.6(e)(2)]} \)

\( t = t_w = 0.3 \text{ inch} \)
\( C_v = 1.475 \)

Allowable shear stress = \( F_v = (F_y/2.89)C_v = > 0.4F_y = 14.4 \text{ ksi} \) Hence allowable=14.4ksi

Actual Shear Stress

\( F_y = 12.5 \text{ kip}, V_y = D t_w = 4.8 \text{ inch}^2 \)
\( f_v = F_y/V_y = 2.6 \text{ ksi} \)

Stress ratio = \( f_v/F_v = 0.18 \)

V. ASME NF 3000 1998 Angle

Verify the allowable stress and critical ratio of the brace members in a frame using the ASME NF 3000 1998 code.

**Details**

The forces due to loading in member 6 is 2,666.18 lbs (tension) and in member 7 is 7,104.23 lbs (compression). Members 6 and 7 are “truss” members (axial-only).

Both member 6 and 7 are L 80x60x10, grade A36 steel ($F_y = 36$ ksi, $F_u = 58$ ksi).
Assume a net section factor of 0.9, an effective length factor of 0.85, and $C_t = 0.9$. 

---

### Verification Examples

**V.09 Steel Design**

---

**Figure 503: Space frame subjected to static loads**
Validation

\[ L = \sqrt{5^2 + 6^2} \text{(12in/ft)} = 93.726 \text{in} \]

Slenderness ratio (same for both members) using the minimum value of \( r \): \( kL/r_z = 0.85(93.726)/1.29 = 61.76 \)

For member 6, \( kL/r_z = 61.76 < 300 \)

For member 7, \( kL/r_z = 61.76 < 200 \)

Axial Tension: Member 6 (per NF-98.1.a)

Corrected area, \( A_c = C_t \times A_x = 7.57 \text{ in}^2 \)

Actual tensile stress \( = P/A = 2,666.18 / 7.57 = 352.2 \text{ psi} \)

Allowable tensile stress (Tension capacity) \( = 0.6 \times F_y = 0.6 \times 36 = 21.6 \text{ ksi} \)

Critical ratio \( = 352.2/21,600 = 0.016 \)

Axial Compression: Member 7 (NF-98.1.c)

Actual compressive stress \( = P/A = 7,104.23 / 8.41 = 844.74 \text{ psi} \)

\[ C_c' = \sqrt{\frac{2\pi^2E}{Q_sQ_yF_y}} = 126.2 \quad \text{(NF-3322.2(e)(5))} \]

\( (kL/r)_{min} < C_c' \), allowable compression stress, \( F_a = 17.2 \text{ ksi} \)

Critical ratio \( = 844.74 / 17,200 = 0.049 \)

V. ASME NF 3000 1998 Channel

Verify the design of channel section used for a beam member using the ASME NF 3000 1998 code.

Details

The beam is a propped cantilever 80 inches long. The beam is loaded with a 2 kip concentrated load at midspan and a uniformly distributed load of 1 kip/in over the entire length.

The member is C15x50 channel section with Grade A36 steel.

Validation

Maximum shear force (at fixed end): V = 51.375 kips (taken from STAAD.Pro analysis)

Maximum moment (at fixed end): M = 830.0 in-kip (taken from STAAD.Pro analysis)

Slenderness Ratio

About z-axis: \( (KL/r)_z = 0.85(80 \text{ in})/(5.25 \text{ in}) = 12.95 \)

About y-axis: \( (KL/r)_y = 0.85(80 \text{ in})/(0.865 \text{ in}) = 78.61 \)

Max. slenderness ratio < 300, OK.

Bending About Major Axis (Z Axis)

\[
\frac{b_f}{t_f} = 4.62 < \frac{65}{\sqrt{F_y}} = 10.83
\]

The laterally unsupported length of the compression flange, \( L_b = 80 < \frac{76b_f}{\sqrt{F_y}} = 120 \)

and \( \frac{200,000}{d/A_f}F_y = 89.56 \)

As \( b_f/t_f \) is not in the range of \( 65/\sqrt{F_y} \) and \( 95/\sqrt{F_y} \), the value of allowable bending compressive and tensile stress = \( F_{bty} = F_{bcy} = 0.6\times F_y = 21.6 \text{ ksi} \)
Actual bending stress:

Bending Tensile Stress = bending compressive stress = \( f_{btz} = f_{bz} = \frac{MzD}{(2I_z)} = 15.4 \text{ ksi} \)

\[
830.0 \times 15.0 / (2 \times 404) = 15.41 \text{ ksi}
\]

Critical ratio = 15.41 ksi / 21.6 ksi = 0.713

Shear

Actual shear:

\[
F_y = 51.375 \text{ kips}
\]

\[
V_y = D \times t_w = 10.8 \text{ in}^2
\]

\[
f_{v,y} = \frac{F_y}{V_y} = 4.76 \text{ ksi}
\]

Allowable shear:

\[
a = \text{clear distance between transverse stiffeners (here taken as length)} = 80 \text{ in}
\]

\[
h = \text{clear distance flanges of the girder} = D - 2t_f = 14.35 \text{ in}
\]

Thus, \( a/h = 5.57, \text{Therefore, } k = 5.34 + \left[ 4.00 / (a/h)^2 \right] = 5.46 \)

\[
t = t_w = 0.72 \text{ inch}
\]

\[
C_v = 17.2
\]

\[
F_v = \left( \frac{F_y}{2.89} \right) C_v \geq 0.4 \times F_y = 14.4 \text{ ksi}
\]

Hence allowable=14.4 ksi

Therefore, Ratio = \( f_v/F_v = 0.330 \)

### V. ASME NF 3000 1998 Pipe

Verify the design of a pipe section used for a beam member per the ASME NF 3000 1998 code.

**Details**

The simply supported beam is 50 inches long. The beam is loaded with a 1.5 kip concentrated load at midspan and a uniformly distributed load of 1 kip/in over the entire length.

The member is PIPS 120 pipe section with Grade A36 steel.
Validation

Maximum shear force, \( V = \frac{P}{2} + \frac{wL}{2} = \frac{1.5}{2} + \frac{1.0(50)}{2} = 25.75 \text{ kips} \)

Maximum moment, \( M = \frac{PL}{4} + \frac{wL^2}{8} = \frac{1.5(50)}{4} + \frac{1.0(50)^2}{8} = 331.25 \text{ in} \cdot \text{kip} \)

Slenderness ratio = \( (KL/r) = 9.72 < 300 \)

Bending About Major Axis (Z-Axis)

Section is compact: \( \frac{OD}{t} = 36.43 < \frac{3.300}{F_y} = 91.67 \)

Allowable bending stress: \( F_b = 0.66 \times F_y = 23.76 \text{ ksi} \)

Actual bending stress: \( f_{btz} = f_{bcz} = \frac{M_z (OD)}{I_z} = \frac{331.25 (12.75)}{262 \left( \frac{12.75}{2} \right)} = 8.06 \text{ ksi} \)

Stress ratio: 0.339

Shear

From the reference, the shear area:

\[
A_y = \frac{0.25 \pi (r_2^4 - r_1^4) 2(r_2 - r_1)}{2^2 (r_2^3 - r_1^3)}
\]

where

\[ r_1 = \text{inner radius} \]
\[ r_2 = \text{outer radius} \]

Shear area: \( A_y = 6.8 \text{ in}^2 \)

Actual shear stress (at supports): \( f_v = \frac{25.75}{6.8} = 3.78 \text{ ksi} \)

Actual shear stress (at midspan): \( f_v = \frac{0.75}{6.8} = 0.110 \text{ ksi} \)

Allowable shear stress, \( F_v = 0.4 \times F_y = 14.4 \text{ ksi} \)

Stress ratio: 3.78/14.4 = 0.263

V. ASME NF 3000 1998 Tee

Verify the design of a pipe section used for a beam member per the ASME NF 3000 1998 code.

Details

A cantilever beam is 60 in long. The beam is loaded at the free end with a 2 kip load and a uniform load of 1 kip/in along the entire length.

The member is a WT18x67.5 section with Grade A36 steel.

Validation

Maximum shear force (at support) = \( V = wL + P = (1 \text{ kip/in}) \times 60 \text{ in} + 2 \text{ kip} = 62 \text{ kips} \)

Maximum moment (at support) = \( M = 0.5 \times w \times L^2 + P \times L = 0.5 (1 \text{ kip/in}) \times (60 \text{ in})^2 + (2 \text{ kip}) \times (60 \text{ in}) = 1,920 \text{ in kips} \)

Slenderness Ratio

Slenderness Ratio along Z-Axis = \( (KL/r)_z = 21.22 \)

Slenderness Ratio along Y-Axis = \( (KL/r)_y = 50.53 \)

Maximum Slenderness Ratio = 50.53 < 300

Bending

Allowable Bending Stress About Major Axis (Z Axis)

\( \frac{b t_f}{2 t_f} = 4.65 > 65/\sqrt{(F_Y)} = 10.833 \)

\( \frac{d}{t_w} = 28.3 < 640/\sqrt{(F_Y)} = 106.67 \)
Thus allowable bending stress is obtained by treating the section as compact.

\[ F_b = 0.66 \times F_Y = 23.8 \text{ ksi} \]

**Actual Bending Stress**

Bending Tensile Stress  
\[ f_{btz} = (Mz/Iz) \times Y_{bar} = 14.93 \text{ ksi} < 23.8 \text{ ksi} \]

Bending Compressive Stress  
\[ f_{bcz} = 38.7 \text{ ksi} > 23.8 \text{ ksi} \]

Critical stress ratio  
\[ 38.7 \text{ ksi} / 23.8 \text{ ksi} = 1.626 \]

**Shear**

Allowable Shear Stress

\[ a = \text{clear distance between transverse stiffeners (here taken as length)} = 60 \text{ in} \]

\[ h = \text{clear distance flanges of the girder} = D-t_f = 17.01 \text{ in} \]

Thus, \( a/h = 3.527 \)

Therefore,  
\[ k = 5.34 + \left[ \frac{4.00}{(a/h)^2} \right] = 5.65 \]

\[ t = t_w = 0.44 \text{ inch} \]

If \( Cv > 0.8 \),  
\[ Cv = \frac{190}{(h/t)} \sqrt{(h/Sy)} = 78.4 \text{ which is true. Thus, the value of } Cv \text{ is taken as 78.4} \]

Allowable shear stress  
\[ F_v = \frac{FY}{2.89} Cv \leq 0.4F_y = 14.4 \text{ ksi} \]

Hence allowable shear = 14.4 ksi

**Actual Shear**

\[ V_Y = Dt_w = 10.68 \text{ in}^2 \]

\[ f_v = F_y/V_Y = 5.805 \text{ ksi} \]

Stress ratio  
\[ \frac{f_v}{F_v} = 0.403 \]

**Results**

V. ASME NF 3000 1998 WShaped

Verify the design of a wide-flange section used for a cantilever beam using the ASME NF 3000 1998 code.

Details

The beam is a 10 ft cantilever with a 12.5 kip concentrated load at the free end.
The member is a W16X40 section with Grade A36 steel.

Validation

Maximum shear force (constant shear): $V = 12.5 \text{ kips}$

Maximum moment (at fixed end): $M = 12.5 \text{ kips} \times 120 \text{ in} = 1,500 \text{ in} \cdot \text{kips}$

Slenderness Ratio

$(Kl/r)_z = \text{Slenderness Ratio along Z-Axis} = 18.11$

$(Kl/r)_y = \text{Slenderness Ratio along Y-Axis} = 76.68$

Maximum Slenderness Ratio = $76.68 < 240$ (Hence OK)

Bending about Major Axis (Z Axis)

Allowable Bending Stress

$$\frac{b_f}{2t_f} = 6.862 < 65/(F_y)^{0.5} \quad [\text{Ref. NF3322.1(d)(2)}]$$

Thus, allowable bending tensile stress = $F_{b_{tz}} = F_y \times [0.79 - 0.002 \times (b_f/2t_f) \times \sqrt{F_y}] = 25.47 \text{ ksi}$

Actual Bending Stress

Bending Tensile Stress = Bending Compressive Stress = $f_{b_{tz}} = f_{bcz} = M_zD/2I_z = 23.17 \text{ ksi}$

Stress ratio = $23.16 \text{ ksi} / 25.47 \text{ ksi} = 0.909$

Shear

Allowable Shear Stress

$a = \text{clear distance between transverse stiffeners (here taken as length)} = 120 \text{ in}$
h = clear distance flanges of the girder = $D - 2t_f = 14.91$ in

Thus, $a/h = 8.05$, Therefore, $k = 5.34 + \left[ \frac{4.00}{(a/h)^2} \right] = 5.36$ [Ref. NF3322.6(e)(2)]

$t = t_w = 0.3$ inch

$C_v = 1.475$

Allowable shear stress $= F_v = \left( \frac{F_y}{2.89} \right) C_v = > 0.4F_y = 14.4$ ksi Hence allowable=14.4 ksi

Actual Shear Stress

$F_y = 12.5$ kip, $V_y = D t_w = 4.8$ inch$^2$

$f_v = F_y/V_y = 2.6$ ksi

Stress ratio $= f_v/F_v = 0.18$

V. ASME NF 3000 2001 Angle

Verify the allowable stress and critical ratio of the brace members in a frame using the ASME NF 3000 2001 code.

STAAD.Pro 6030 User Manual
Details

The forces due to loading in member 6 is 2,666.18 lbs (tension) and in member 7 is 7,104.23 lbs (compression). Members 6 and 7 are “truss” members (axial-only).

Both member 6 and 7 are L 80x60x10, grade A36 steel ($F_y = 36 \text{ ksi}, F_u = 58 \text{ ksi}$).

Assume a net section factor of 0.9, an effective length factor of 0.85, and $C_t = 0.9$.

Validation

$L = \sqrt{5^2 + 6^2}(12 \text{ in/ft}) = 93.726 \text{ in}$

Slenderness ratio (same for both members) using the minimum value of $r$: $kL/r_z = 0.85(93.726)/1.29 = 61.76$

For member 6, $kL/r_z = 61.76 < 300$

For member 7, $kL/r_z = 61.76 < 200$

Axial Tension: Member 6

Corrected area, $A_c = C_t \times A_x = 7.57 \text{ in}^2$

Actual tensile stress $= P/A = 2,666.18 / 7.57 = 352.2 \text{ psi}$

Allowable tensile stress (Tension capacity) $= 0.6 \times F_y = 0.6 \times 36 = 21.6 \text{ ksi}$

Critical ratio $= 352.2/21,600 = 0.016$

Axial Compression: Member 7

Actual compressive stress $= P/A = 7,104.23 / 8.41 = 844.74 \text{ psi}$

$$C_c' = \sqrt{\frac{2n^2E}{Q_a Q_u F_y}} = 126.2$$  \hspace{1cm} (NF-3322.2(e)(5))
(kL/r)_{min} < C_{c}', allowable compression stress, \( F_a = 17.2 \text{ ksi} \)

Critical ratio = \( \frac{844.74}{17,200} = 0.049 \)

### Related Links
- [D1.L4. ASME NF 3000 - 2001 & 2004 Codes](on page 1331)
V. ASME NF 3000 2001 Channel

Verify the design of channel section used for a beam member using the ASME NF 3000 2001 code.

Details

The beam is a propped cantilever 80 inches long. The beam is loaded with a 2 kip concentrated load at midspan and a uniformly distributed load of 1 kip/in over the entire length.

The member is C15x50 channel section with Grade A36 steel.

Validation

Maximum shear force (at fixed end): \( V = 51.375 \text{ kips} \) (taken from STAAD.Pro analysis)

Maximum moment (at fixed end): \( M = 830.0 \text{ in-kip} \) (taken from STAAD.Pro analysis)

Slenderness Ratio

About z-axis: \( (KL/r)_z = 0.85(80 \text{ in})/(5.25 \text{ in}) = 12.95 \)

About y-axis: \( (KL/r)_y = 0.85(80 \text{ in})/(0.865 \text{ in}) = 78.61 \)

Max. slenderness ratio < 300, OK.

Bending About Major Axis (Z Axis)

\[
\frac{b_f}{t_f} = 4.62 < \frac{65}{\sqrt{F_y}} = 10.83
\]

The laterally unsupported length of the compression flange, \( L_b = 80 < \frac{76b_f}{\sqrt{F_y}} = 120 \)

and \( < \frac{20,000}{(d/A_f)F_y} = 89.56 \)

As \( b_f/t_f \) is not in the range of \( 65/\sqrt{(F_y)} \) and \( 95/\sqrt{(F_y)} \), the value of allowable bending compressive and tensile stress \( F_{bty} = F_{bcy} = 0.6\times F_y = 21.6 \text{ ksi} \)

Actual bending stress:

Bending Tensile Stress = bending compressive stress = \( f_{btz} = f_{bcz} = MzD / (2I_z) = 15.4 \text{ ksi} \)

\[
830.0 (15.0) / (2 \times 404) = 15.41 \text{ ksi}
\]

Critical ratio = 15.41 ksi / 21.6 ksi = 0.713

Shear

Actual shear:

\[
F_y = 51.375 \text{ kips}
\]

\[
V_y = D\times t_w = 10.8 \text{ in}^2
\]

\[
f_{v,y} = F_y/V_y = 4.76 \text{ ksi}
\]

Allowable shear:

\[
a = \text{clear distance between transverse stiffeners (here taken as length)} = 80 \text{ in}
\]

\[
h = \text{clear distance flanges of the girder} = D-2t_f = 14.35 \text{ in}
\]

Thus, \( a/h = 5.57 \), Therefore, \( k = 5.34 + [4.00 / (a/h)^2] = 5.46 \)
t = t_w = 0.72 inch

C_v = 17.2

F_v = (F_y/2.89)C_v ≥ 0.4\times F_y = 14.4 \text{ ksi}

Hence allowable = 14.4 ksi

Therefore, Ratio = \frac{f_v}{F_v} = 0.330

Verification Examples
V.09 Steel Design

STAAD.Pro 6039 User Manual
V. ASME NF 3000 2001 Pipe

Verify the design of a pipe section used for a beam member per the ASME NF 3000 2001 code.

Details

The simply supported beam is 50 inches long. The beam is loaded with a 1.5 kip concentrated load at midspan and a uniformly distributed load of 1 kip/in over the entire length.

The member is PIPS 120 pipe section with Grade A36 steel.

Validation

Maximum shear force, \[ V = \frac{P}{2} + \frac{wL}{2} = \frac{1.5}{2} + \frac{1.0(50)}{2} = 25.75 \text{kips} \]

Maximum moment, \[ M = \frac{PL}{4} + \frac{wL^2}{8} = \frac{1.5(50)}{4} + \frac{1.0(50)^2}{8} = 331.25 \text{in} \cdot \text{kip} \]

Slenderness ratio = \( \frac{KL}{r} \) = 9.72 < 300

Bending About Major Axis (Z-Axis)

Section is compact: \( \frac{OD}{t} = 36.43 < \frac{3}{300} \frac{F_y}{P} = 91.67 \)

Allowable bending stress: \( F_b = 0.66 \times F_y = 23.76 \text{ksi} \)

Actual bending stress: \( f_{btz} = f_{bcz} = \frac{M_z}{T_z \left( \frac{OD}{2} \right)} = \frac{331.25}{262 \left( \frac{12.75}{2} \right)} = 8.06 \text{ksi} \)

Stress ratio: 0.339

Shear

From the reference, the shear area:

\[
A_y = \frac{0.25n(r_2^4 - r_1^4)2(r_2 - r_1)}{2 \frac{2}{3}(r_2^3 - r_1^3)}
\]
where

\[ r_1 = \text{inner radius} \]
\[ r_2 = \text{outer radius} \]

Shear area: \( A_y = 6.8 \text{ in}^2 \)

Actual shear stress (at supports): \( f_v = 25.75 / 6.8 = 3.78 \text{ ksi} \)

Actual shear stress (at midspan): \( f_v = 0.75 / 6.8 = 0.110 \text{ ksi} \)

Allowable shear stress, \( F_v = 0.4 \times F_y = 14.4 \text{ ksi} \)

Stress ratio: \( 3.78/14.4 = 0.263 \)

Related Links
- D1.L.4. ASME NF 3000 - 2001 & 2004 Codes (on page 1331)
V. ASME NF 3000 2001 Tee

Verify the design of a pipe section used for a beam member per the ASME NF 3000 2001 code.

Details

A cantilever beam is 60 in long. The beam is loaded at the free end with a 2 kip load and a uniform load of 1 kip/in along the entire length.

The member is a WT18x67.5 section with Grade A36 steel.

Validation

Maximum shear force (at support) = \( V = wL + P = (1 \text{ kip/in}) \times 60 \text{ in} + 2 \text{ kip} = 62 \text{ kips} \)

Maximum moment (at support) = \( M = 0.5 \times w \times L^2 + P \times L = 0.5 \times (1 \text{ kip/in}) \times (60 \text{ in})^2 + (2 \text{ kip}) \times (60 \text{ in}) = 1,920 \text{ in·kips} \)

Slenderness Ratio

Slenderness Ratio along Z-Axis = \((KL/r)_z = 21.22\)

Slenderness Ratio along Y-Axis = \((KL/r)_y = 50.53\)

Maximum Slenderness Ratio = 50.53 < 300

Bending

Allowable Bending Stress About Major Axis (Z Axis)

\[
\frac{b_f}{2t_f} = 4.65 > 65/\sqrt{(F_Y)} = 10.833
\]

\[
d/t_w = 28.3 < 640/\sqrt{(F_Y)} = 106.67
\]

Thus allowable bending stress is obtained by treating the section as compact.

\[
F_b = 0.66 \times F_Y = 23.8 \text{ ksi}
\]

Actual Bending Stress

Bending Tensile Stress = \( f_{btz} = (Mz/Iz) \times Y_{bar} = 14.93 \text{ ksi} < 23.8 \text{ ksi} \)

Bending Compressive Stress = \( f_{bcz} = 38.7 \text{ ksi} > 23.8 \text{ ksi} \)

Critical stress ratio = 38.7 ksi / 23.8 ksi = 1.626

Shear

Allowable Shear Stress

\( a = \) clear distance between transverse stiffeners (here taken as length) = 60 in

\( h = \) clear distance flanges of the girder = \( D-t_f = 17.01 \text{ in} \)

Thus, \( a/h = 3.527 \) Therefore, \( k = 5.34 + [4.00 / (a/h)^2] = 5.65 \)

\[ t = t_w = 0.44 \text{ inch} \]

If \( C_v > 0.8, C_v = [190/(h/t)] \times \sqrt{(h/2F_Y)} = 78.4 \) which is true. Thus, the value of \( C_v \) is taken as 78.4

Allowable shear stress = \( F_v = (F_Y/2.89)C_v \leq 0.4F_Y = 14.4 \text{ ksi} \)

Hence allowable shear = 14.4ksi

Actual Shear
Vy = Dt_w = 10.68 in²
fv = Fy/Vy = 5.805 ksi
Stress ratio = fv/Fv = 0.403

### Related Links
- D1.L.4. ASME NF 3000 - 2001 & 2004 Codes (on page 1331)

## V. ASME NF 3000 2001 WShaped

Verify the design of a wide-flange section used for a cantilever beam using the ASME NF 3000 2001 code.

### Details
The beam is a 10 ft cantilever with a 12.5 kip concentrated load at the free end.

The member is a W16X40 section with Grade A36 steel.
Validation

Maximum shear force (constant shear): \( V = 12.5 \text{ kips} \)

Maximum moment (at fixed end): \( M = 12.5 \text{ kips} \times 120 \text{ in} = 1,500 \text{ in \cdot kips} \)

Slenderness Ratio

\((KL/r)_z\) = Slenderness Ratio along Z-Axis = 18.11

\((KL/r)_y\) = Slenderness Ratio along Y-Axis = 76.68

Maximum Slenderness Ratio = 76.68 < 240 (Hence OK)

Bending about Major Axis (Z Axis)

Allowable Bending Stress

\[
\frac{b_f}{2t_f} \left(\frac{F_y}{2}\right)^{0.5} \leq 65/\left(F_y^{0.5}\right) \quad \text{[Ref. NF3322.1(d)(2)]}
\]

Thus, allowable bending tensile stress

\[
F_{btz} = F_y \times \left[0.79 - 0.002 \times \left(\frac{b_f}{2t_f}\right) \times \sqrt{F_y}\right] = 25.47 \text{ ksi}
\]

Actual Bending Stress

Bending Tensile Stress = Bending Compressive Stress

\( f_{btz} = f_{bcz} = M_z D / 2I_z = 23.17 \text{ ksi} \)

Stress ratio = 23.16 ksi / 25.47 ksi = 0.909

Shear

Allowable Shear Stress

\( a \) = clear distance between transverse stiffeners (here taken as length) = 120 in

\( h \) = clear distance flanges of the girder = \( D - 2t_f \)

Thus, \( a/h = 8.05 \), Therefore, \( k = 5.34 + \left[\frac{4.00}{a/h}\right]^2 \) = 5.36 [Ref. NF3322.6(e)(2)]

\[
t = t_w = 0.3 \text{ inch}
\]

\( C_v = 1.475 \)

Allowable shear stress \( F_v = (F_y/2.89)C_v = > 0.4F_y = 14.4 \text{ ksi} \) Hence allowable = 14.4 ksi

Actual Shear Stress

\[
F_y = 12.5 \text{ kip}, \ V_y = D t_w = 4.8 \text{ inch}^2
\]

\( f_v = F_y/V_y = 2.6 \text{ ksi} \)

Stress ratio = \( f_v/F_v = 0.18 \)

## Verification Examples

### V. ASME NF 3000 2004 Angle

Verify the allowable stress and critical ratio of the brace members in a frame using the ASME NF 3000 2004 code.

### Details

The forces due to loading in member 6 is 2,666.18 lbs (tension) and in member 7 is 7,104.23 lbs (compression). Members 6 and 7 are “truss” members (axial-only).

</tbody>
</table>
Both member 6 and 7 are L 80x60x10, grade A36 steel ($F_y = 36 \text{ ksi}, F_u = 58 \text{ ksi}$). Assume a net section factor of 0.9, an effective length factor of 0.85, and $C_t = 0.9$.

**Validation**

\[
L = \sqrt{5^2 + 6^2} \times (12 \text{ in/ft}) = 93.726 \text{ in}
\]

Slenderness ratio (same for both members) using the minimum value of $r$: $kL/r_z = 0.85(93.726)/1.29 = 61.76$

For member 6, $kL/r_z = 61.76 < 300$

For member 7, $kL/r_z = 61.76 < 200$

**Axial Tension: Member 6**

Corrected area, $A_c = C_t \times A_x = 7.57 \text{ in}^2$

Actual tensile stress = $P/A = 2,666.18 / 7.57 = 352.2 \text{ psi}$

Allowable tensile stress (Tension capacity) = $0.6 \times F_y = 0.6 \times 36 = 21.6 \text{ ksi}$

Critical ratio = $352.2 / 21,600 = 0.016$

**Axial Compression: Member 7**

Actual compressive stress = $P/A = 7,104.23 / 8.41 = 844.74 \text{ psi}$

\[
C_c' = \sqrt{\frac{2n^2E}{(Q_s \cdot Q_a)^2}} = 126.2 \quad \text{(NF-3322.2(e)(5))}
\]

$(kL/r)_{min} < C_c'$; allowable compression stress, $F_a = 17.2 \text{ ksi}$

Critical ratio = $844.74 / 17,200 = 0.049$

- D1.L.4. ASME NF 3000 - 2001 & 2004 Codes (on page 1331)

V. ASME NF 3000 2004 Channel
Verify the design of channel section used for a beam member using the ASME NF 3000 2004 code.
Details
The beam is a propped cantilever 80 inches long. The beam is loaded with a 2 kip concentrated load at midspan and a uniformly distributed load of 1 kip/in over the entire length.
The member is C15x50 channel section with Grade A36 steel.

Validation
Maximum shear force (at fixed end): \( V = 51.375 \) kips (taken from STAAD.Pro analysis)
Maximum moment (at fixed end): \( M = 830.0 \) in-kip (taken from STAAD.Pro analysis)

Slenderness Ratio
About z-axis: \( (KL/r)_z = 0.85(80 \text{ in})/(5.25 \text{ in}) = 12.95 \)
About y-axis: \( (KL/r)_y = 0.85(80 \text{ in})/(0.865 \text{ in}) = 78.61 \)
Max. slenderness ratio < 300, OK.

Bending About Major Axis (Z Axis)
\[
\frac{b_f}{t_f} = 4.62 < \frac{65}{\sqrt{F_y}} = 10.83
\]
The laterally unsupported length of the compression flange, \( L_b = 80 < \frac{76b_f}{(d/A_f)F_y} = 120 \)
and \( < \frac{20,000}{(d/A_f)F_y} = 89.56 \)

As \( b_f/t_f \) is not in the range of \( 65/\sqrt{F_y} \) and \( 95/\sqrt{F_y} \), the value of allowable bending compressive and tensile stress = \( F_{bty} = F_{bcy} = 0.6\times F_y = 21.6 \) ksi

Actual bending stress:
Bending Tensile Stress = bending compressive stress = \( f_{btz} = f_{bcz} = MzD / (2I_z) = 15.4 \) ksi
Critical ratio = 15.41 ksi / 21.6 ksi = 0.713

Shear
Actual shear:
\[
F_y = 51.375 \text{ kips}
\]
\[
V_y = D\times t_w = 10.8 \text{ in}^2
\]
\[
f_{v,y} = F_y/V_y = 4.76 \text{ ksi}
\]
Allowable shear:
a = clear distance between transverse stiffeners (here taken as length) = 80 in
h = clear distance flanges of the girder = \( D-2t_f = 14.35 \text{ in} \)
Thus, \( a/h = 5.57 \), Therefore, \( k = 5.34 + [4.00/ (a/h)^2] = 5.46 \)
\[
t = t_w = 0.72 \text{ inch}
\]
\( Cv = 17.2 \)
\[ F_v = (\frac{F_y}{2.89})C_v \geq 0.4 \times F_y = 14.4 \text{ ksi} \]

Hence allowable = 14.4 ksi

Therefore, Ratio = \( \frac{f_v}{F_v} = 0.330 \)

### V. ASME NF 3000 2004 Pipe

Verify the design of a pipe section used for a beam member per the ASME NF 3000 2004 code.

#### Details

The simply supported beam is 50 inches long. The beam is loaded with a 1.5 kip concentrated load at midspan and a uniformly distributed load of 1 kip/in over the entire length.
Verification Examples
V.09 Steel Design

The member is PIPS 120 pipe section with Grade A36 steel.

Validation

Maximum shear force, \( V = \frac{P}{2} + \frac{wL}{2} = \frac{1.5}{2} + \frac{1.0(50)}{2} = 25.75 \text{kips} \)

Maximum moment, \( M = \frac{PL}{4} + \frac{wL^2}{8} = \frac{1.5(50)}{4} + \frac{1.0(50)^2}{8} = 331.25 \text{ in} \cdot \text{kip} \)

Slenderness ratio = \( (KL/r) = 9.72 < 300 \)

Bending About Major Axis (Z-Axis)

Section is compact: \( \frac{OD}{t} = 36.43 < \frac{3,300}{F_y} = 91.67 \)

Allowable bending stress: \( F_b = 0.66 \times F_y = 23.76 \text{ ksi} \)

Actual bending stress: \( f_{btz} = f_{bcz} = \frac{M}{I_z} \left( \frac{OD}{2} \right) = \frac{331.25 \left( \frac{12.75}{2} \right)}{262} = 8.06 \text{ ksi} \)

Stress ratio: 0.339

Shear

From the reference, the shear area:

\[
A_y = \frac{0.25n(r_2^4 - r_1^4)}{2(r_2^3 - r_1^3)}
\]

where

\( r_1 = \) inner radius
\( r_2 = \) outer radius

Shear area: \( A_y = 6.8 \text{ in}^2 \)

Actual shear stress (at supports): \( f_v = \frac{25.75}{6.8} = 3.78 \text{ ksi} \)

Actual shear stress (at midspan): \( f_v = \frac{0.75}{6.8} = 0.110 \text{ ksi} \)

Allowable shear stress, \( F_v = 0.4 \times F_y = 14.4 \text{ ksi} \)

Stress ratio: 3.78/14.4 = 0.263

### V. ASME NF 3000 2004 Tee

Verify the design of a pipe section used for a beam member per the ASME NF 3000 2004 code.

**Details**

A cantilever beam is 60 in long. The beam is loaded at the free end with a 2 kip load and a uniform load of 1 kip/in along the entire length.

The member is a WT18x67.5 section with Grade A36 steel.

**Validation**

Maximum shear force (at support) = \( V = wL + P = (1 \text{ kip/in}) \times 60 \text{ in} + 2 \text{ kip} = 62 \text{ kips} \)

Maximum moment (at support) = \( M = 0.5 \times w \times L^2 + P \times L = 0.5 \times (1 \text{ kip/in}) \times (60 \text{ in})^2 + (2 \text{ kip}) \times (60 \text{ in}) = 1,920 \text{ in kips} \)

**Slenderness Ratio**

Slenderness Ratio along Z-Axis = \( (KL/r)_z = 21.22 \)

Slenderness Ratio along Y-Axis = \( (KL/r)_y = 50.53 \)

Maximum Slenderness Ratio = 50.53 < 300
Bending
Allowable Bending Stress About Major Axis (Z Axis)
\[ \frac{b}{2t_f} = 4.65 > \frac{65}{\sqrt{F_y}} = 10.833 \]
\[ \frac{d}{t_w} = 28.3 < \frac{640}{\sqrt{F_y}} = 106.67 \]
Thus allowable bending stress is obtained by treating the section as compact.
\[ F_b = 0.66 \times F_y = 23.8 \text{ ksi} \]
Actual Bending Stress
Bending Tensile Stress
\[ f_{btz} = \frac{(M_z/I_z) \times Y_{bar}}{Y} = 14.93 \text{ ksi} < 23.8 \text{ ksi} \]
Bending Compressive Stress
\[ f_{bcz} = 38.7 \text{ ksi} > 23.8 \text{ ksi} \]
Critical stress ratio = \[ \frac{38.7 \text{ ksi}}{23.8 \text{ ksi}} = 1.626 \]
Shear
Allowable Shear Stress
\[ \text{a} = \text{clear distance between transverse stiffeners (here taken as length)} = 60 \text{ in} \]
\[ h = \text{clear distance flanges of the girder} = D - t_f = 17.01 \text{ in} \]
Thus, \[ \frac{a}{h} = 3.527 \]
Therefore, \[ k = 5.34 + \left( \frac{4.00}{(a/h)^2} \right) = 5.65 \]
\[ t = t_w = 0.44 \text{ inch} \]
If \( Cv > 0.8 \), \[ Cv = \frac{190/(h/t)}{\sqrt{(k/S_y)}} = 78.4 \text{ which is true. Thus, the value of } Cv \text{ is taken as 78.4} \]
Allowable shear stress = \[ F_v = (FY/2.89)Cv \leq 0.4F_y = 14.4 \text{ ksi} \]
Hence allowable shear = 14.4 ksi
Actual Shear
\[ V_y = D t_w = 10.68 \text{ in}^2 \]
\[ f_v = F_y/V_y = 5.805 \text{ ksi} \]
Stress ratio = \[ \frac{f_v}{F_v} = 0.403 \]

Verification Examples

V. ASME NF 3000 2004 WShaped

Verify the design of a wide-flange section used for a cantilever beam using the ASME NF 3000 2004 code.

Details
The beam is a 10 ft cantilever with a 12.5 kip concentrated load at the free end.
The member is a W16X40 section with Grade A36 steel.

Validation
Maximum shear force (constant shear): $V = 12.5$ kips
Maximum moment (at fixed end): $M = 12.5$ kips $\times 120$ in $= 1,500$ in·kips
Slenderness Ratio
$(KL/r)_z = $ Slenderness Ratio along Z-Axis $= 18.11$
$(KL/r)_y = $ Slenderness Ratio along Y-Axis $= 76.68$
Maximum Slenderness Ratio $= 76.68 < 240$ (Hence OK)
Bending about Major Axis (Z Axis)
Allowable Bending Stress
$$\frac{b_f}{2t_f} = 6.862 < 65/(F_y)^{0.5}$$ [Ref. NF3322.1(d)(2)]
Thus, allowable bending tensile stress $= F_{btz} = F_y \times (0.79 - 0.002 \times (b_f / 2t_f) \times \sqrt{F_y}) = 25.47$ ksi
Actual Bending Stress
Bending Tensile Stress = Bending Compressive Stress = \( f_{btz} = f_{bcz} = \frac{M_zD}{2I_z} = 23.17 \text{ ksi} \)

Stress ratio = \( \frac{23.16 \text{ ksi}}{25.47 \text{ ksi}} = 0.909 \)

Shear

Allowable Shear Stress

\( a = \) clear distance between transverse stiffeners (here taken as length) = 120 in

\( h = \) clear distance flanges of the girder = \( D - 2t_f = 14.91 \text{ in} \)

Thus, \( \frac{a}{h} = 8.05 \), Therefore, \( k = 5.34 + \frac{4.00}{(a/h)^2} = 5.36 \) [Ref. NF3322.6(e)(2)]

\[ t = t_w = 0.3 \text{ inch} \]

\[ C_v = 1.475 \]

Allowable shear stress = \( F_v = \frac{F_y}{2.89}C_v = > 0.4F_y = 14.4 \text{ ksi} \) Hence allowable = 14.4 ksi

Actual Shear Stress

\[ F_y = 12.5 \text{ kip, } V_y = D t_w = 4.8 \text{ inch}^2 \]

\[ f_v = \frac{F_y}{V_y} = 2.6 \text{ ksi} \]

Stress ratio = \( \frac{f_v}{F_v} = 0.18 \)

Verification Examples

V.09 Steel Design

 STAAD.Pro  6071  User Manual
V.ASME NF 3000 2004 STYPE 1 Pipe

Verify the design results an austenitic stainless steel pipe section, designed as per ASME NF 3000 2004.

Details

A beam (beam no. 7 in the model) of length 10 ft is loaded with a uniformly distributed load of 1 kip/ft over the whole span, and axial compressive loads of 100 kip at both ends. The beam is assigned with a steel pipe section of PIPS120 and is designed in accordance with ASME NF3000 2004.

The austenitic stainless steel has a yield strength of 36 ksi, an ultimate rupture strength of 58 ksi, and a modulus of elasticity of 29,000 ksi.

Validation

From the analysis:

\[ F_x = 100.145 \text{ kip} \]
\[ F_y = 5 \text{ kip (at ends)} \]
\[ M_z = 97.683 \text{ in} \cdot \text{k} \text{ (at mid-span)} \]
\[ M_y = 10.798 \text{ in} \cdot \text{k} \]

\[
(KL/r)_z = \text{Slenderness Ratio along Z-Axis} = 27.44 = (KL/r)_y = \text{Slenderness Ratio along Y-Axis} < 200 \text{ Hence OK (Refer NF-3322.2(c)(1))}
\]

Check Against Axial Compression

As per clause NF 3322.2(d)(2)(c),

\[ \text{OD/t}_w = 12.75/0.35 = 36.429 < 3,300/F_y = 91.667 \]

Since \((KL/r)_y = 27.44 = (kl/r)_z < 120 \]

As per NF 3322.1(c)(2)(a),

Allowable compressive stress, \( F_a = F_y \left(0.47 - \frac{kl}{r} \right) = 14.7 \text{ ksi} \)

Actual compressive stress \( f_a = F_x/A_x = 7.31 \text{ ksi} \)

Ratio = 0.497

Check Against Bending

Allowable Stress along Major Axis (Z-Axis):

Since as per clause NF 3322.1(d)(1)(a)(7),

\[ \text{OD/t}_w = 12.75/0.35 = 36.429 < 3,300/F_y = 91.67 \]

Thus, allowable bending stress is obtained by treating the section as compact.
Allowable Stress along Minor Axis (Y-Axis):

Here also, allowable stress along minor axis is given as $F_{bcy} = 0.66 \times F_y = 23.8$ ksi = $F_{btz}$

Actual Bending Stress along Major Axis (Z-Axis):

$M_z = 97.683$ in-ky

Bending Tensile Stress $= f_{btz} = (M_z/I_z) \times (OD/2) = 2.38$ ksi < 23.8 ksi, Hence OK.

Bending Compressive Stress $= f_{bcz} = 2.38$ ksi < 23.8 ksi, Hence safe.

Actual Bending Stress along Minor Axis (Y-Axis):

$M_y = 10.798$ in-ky

Bending Tensile Stress $= f_{by} = (M_y/I_y) \times (OD/2) = 0.263$ ksi < 23.8 ksi, Hence OK.

Bending Compressive Stress $= f_{cy} = 0.263$ ksi < 23.8 ksi, Hence safe.

Check for Combined Axial Compression and Bending

$C_{mz} = C_{my} = 1$ (as provided in the input)

Now, $f_a = 7.31$ ksi, $F_a = 14.7$ ksi, $f_{bcz} = 2.38$ ksi, $F_{bcz} = 23.8$ ksi, $f_{bcy} = 0.263$ ksi, $F_{bcy} = 23.8$ ksi

Since $f_a / F_a = 7.31 / 14.7 = 0.497 > 0.15$

$$F_{ez} = \frac{n^2 \times E}{2.15 \times \left(\frac{kl}{r}\right)^2} = 176.804 \text{ ksi}$$  \hspace{1cm} \text{(NF 3322.1(e)(1))}

$$F_{ey} = \frac{n^2 \times E}{2.15 \times \left(\frac{kl}{r}\right)^2} = 176.804 \text{ ksi}$$  \hspace{1cm} \text{(NF 3322.1(e)(1))}

From Eqn. 20:

$$\frac{f_a}{F_a} + \frac{C_{mz} \times f_{bz}}{F_{ez} \times F_{bz}} + \frac{C_{my} \times f_{by}}{(1 \cdot \frac{f_a}{F_{ey}}) \times F_{by}} = 0.613 < 1 \text{, Hence safe (critical ratio)}$$

From Eqn. 21:

$$\frac{f_a}{0.6F_y} + \frac{f_{bz}}{F_{bz}} + \frac{f_{by}}{F_{by}} = 0.449 < 1 \text{, Hence safe}$$

Check Against Shear

Actual Shear along Major Axis:

$$V_y = 2 \times \text{OD} \times t_w = 8.925 \text{ in}^2$$

$$f_{vy} = 5 \text{ kip} / 8.925 \text{ in}^2 = 0.56 \text{ ksi}$$

(No shear along minor axis; $f_{vz} = 0$)

Allowable Shear:

As per NV 3322.1(b)(1), allowable shear stress, $F_v = 0.4 \times F_y = 14.4$ ksi

Ratio = 0.039
## Results

V.10 Concrete Design

V. India

V. IS456 2000-Axially Loaded Rectangular Column

Verify the designed results produced by the program with hand calculated design results for an axially loaded rectangular column section as per IS456:2000.

Details

The fixed-base, 2.5 m column is subjected to axial force of 3,300 kN. The section is 450mm x 600mm. The concrete strength is 25 N/mm$^2$ and the yield strength of steel is 415 N/mm$^2$. Use a clear cover of 40 mm. The main reinforcement is 20 mm and the lateral ties are 8 mm.

Validation

Slenderness Ratio

From Table. 28 Clause E-3 of IS 456 : 2000, the effective length of the compression member:

$$L_{eff} = 2 \times L = 2 \times 2,500 = 5,000 \text{ mm}$$

Least lateral dimension of column = (5,000/450) = 11.11 < 12

Large lateral dimension of column = (5,000/600) = 8.33 < 12

So, we can consider and design as a short column.

Check for Minimum Eccentricity of Column

As per Clause 25.4 of IS 456 : 2000, calculate the minimum eccentricity:

For Depth, $e_{min} = (2,500/500) + (600/30) = 25 \text{ mm} > 20 \text{ mm. (OK)}$

For Width $e_{min} = (2,500/500) + (450/30) = 20 \text{ mm. (OK)}$

Hence Minimum Eccentricity is ok.

Check for Maximum Eccentricity of Column

As per Clause 39.3 of IS 456 : 2000 calculate the maximum eccentricity:

For Depth $e_{max} = 0.05 \times 600 = 30 \text{ mm. Hence, } e_{min} < e_{max} \text{ (OK)}$

For Width $e_{max} = 0.05 \times 450 = 22.5 \text{ mm. Hence, } e_{min} < e_{max} \text{ (OK)}$

Hence Maximum Eccentricity is ok.
Design for Flexure

Gross Area of Column, \( A_g = 450 \times 600 = 27 \times 10^4 \text{ mm}^2 \).

Area of Concrete, \( A_c = A_g - A_{sc} = 27 \times 10^4 - A_{sc} \)

Area of Longitudinal Reinforcement, \( A_{sc} = P_u = 0.4 \times f_{ck} \times A_c + 0.67 \times f_y \times A_{sc} \)

\[
3300 \times 10^3 = 0.4 \times 25 \left[ A_g \cdot A_{sc} \right] + 0.67 \times 415 \times A_{sc} \\
3300 \times 10^3 = 0.4 \times 25 \left[ 27 \times 10^4 \cdot A_{sc} \right] + 0.67 \times 415 \times A_{sc} = 2,238 \text{ mm}^2.
\]

Let assume 20 mm dia bar. So, \( A_{st} = (3.14/4) \times 20^2 = 314.15 \text{ mm}^2 \).

Nos. of Bars will be \( = (2238.3/314.15) = 7.12 \approx 8 \) Nos

So, the actual reinforcement will be \( = 8 \times (3.14/4) \times 20^2 = 2513.2 \text{ mm}^2 \)

As per Clause 26.5.3.2 (c) of IS 456 : 2000 Bar Diameter of Lateral Ties:

\( \frac{1}{4} \times \text{Main Bar dia} = \frac{1}{4} \times 20 = 5 \text{ mm} \)

So, Provide 8 mm dia. bar for lateral ties.

As per Clause 26.5.3.2 (c) of IS 456 : 2000 Pitch of Lateral Ties:

\[
\text{Least lateral dimension} = 450 \text{ mm} \\
16 \times 20 = 320 \text{ mm} \\
300 \text{ mm}
\]

Provide 8 mm dia. bar @ 300 mm for lateral ties.

**V. IS456 2000-Axially Loaded Square Column**

Verify the designed results produced by the program with hand calculated design results for an axially loaded square column section as per IS456:2000.

**Details**

The fixed-base, 2.5 m column is subjected to axial force of 3,300 kN. The section is 500mm x 500mm. The concrete strength is 25 N/mm² and the yield strength of steel is 415 N/mm². Use a clear cover of 40 mm. The main reinforcement is 20 mm and the lateral ties are 8 mm.

**Validation**

**Slenderness Ratio**

From Table. 28 Clause E-3 of IS 456 : 2000, the effective length of the compression member:

\[ L_{eff} = 2 \times L = 2 \times 2,500 = 5,000 \text{ mm} \]

Least lateral dimension of column = \((5,000/500) = 10 < 12\)

Large lateral dimension of column = \((5,000/500) = 10 < 12\)

So, we can consider and design as a short column.

**Check for Minimum Eccentricity of Column**

As per Clause 25.4 of IS 456 : 2000, calculate the minimum eccentricity:

For Depth, \(e_{min} = (2,500/500) + (500/30) = 21.7 \text{ mm} > 20 \text{ mm. (OK)}\)

For Width \(e_{min} = (2,500/500) + (500/30) = 21.7 \text{ mm} > 20 \text{ mm. (OK)}\)

Hence Minimum Eccentricity is ok.
Check for Maximum Eccentricity of Column

As per Clause 39.3 of IS 456 : 2000 calculate the maximum eccentricity:

For Depth \( e_{\text{max}} = 0.05 \times 500 = 25 \text{ mm} \). Hence, \( e_{\text{min}} < e_{\text{max}} \) (OK)

For Width \( e_{\text{max}} = 0.05 \times 500 = 25 \text{ mm} \). Hence, \( e_{\text{min}} < e_{\text{max}} \) (OK)

Hence Maximum Eccentricity is ok.

Design for Flexure

Gross Area of Column, \( A_g = 500 \times 500 = 25 \times 10^4 \text{ mm}^2 \).

Area of Concrete, \( A_c = A_g - A_{sc} = 25 \times 10^4 - A_{sc} \)

Area of Longitudinal Reinforcement, \( A_{sc} = P_u = 0.4 \times f_{ck} \times A_c + 0.67 \times f_y \times A_{sc} \)

\[
3,300 \times 10^3 = 0.4 \times 25 \left[ A_g - A_{sc} \right] + 0.67 \times 415 \times A_{sc}
\]

\[
3,300 \times 10^3 = 0.4 \times 25 \left[ 25 \times 10^4 - A_{sc} \right] + 0.67 \times 415 \times A_{sc}
\]

2,985 mm²

Let assume 25 mm dia bar. So, \( A_{st} = (3.14/4) \times 25^2 = 490.3 \text{ mm}^2 \).

Nos. of Bars will be \( = (2,985/490.3) = 6.1 \approx 8 \text{ Nos} \)

So, the actual reinforcement will be \( = 8 \times (3.14/4) \times 25^2 = 3,925 \text{ mm}^2 \)

As per Clause 26.5.3.2 (c) of IS 456 : 2000 Bar Diameter of Lateral Ties:

\( \frac{1}{4} \times \text{Main Bar dia} = \frac{1}{4} \times 25 = 6.3 \text{ mm} \)

So, Provide 8 mm dia. bar for lateral ties.

As per Clause 26.5.3.2 (c) of IS 456 : 2000 Pitch of Lateral Ties:

Least lateral dimension = 500 mm
16 \times 25 = 400 mm
300 mm

Provide 8 mm dia. bar @ 300 mm for lateral ties.

### V. IS456 2000-Circular Column

Verify the designed results produced by the program with hand calculated design results for an axially loaded circular column section as per IS456:2000.

### References

### Details

The fixed-base, 2.5 m cantilever column is subjected to axial force of 800 kN and a moment at the top of 162.5 kN·m. The section is 500 mm in diameter. The concrete strength is 20 N/mm² and the yield strength of steel is 415 N/mm². Use a clear cover of 50 mm. The main reinforcement is 20 mm and the lateral ties are 10 mm.
Validation

Slenderness Ratio

From Table. 28 Clause E-3 of IS 456 : 2000, the effective length of the compression member:

\[(L_{eff}) = 2 \times L = 2 \times 2,500 = 5,000 \text{ mm}\]

Least lateral dimension of column = \((5,000/500) = 10 < 12\)

Large lateral dimension of column = \((5,000/500) = 10 < 12\)

So, we can consider and design as a short column.

Check for Minimum Eccentricity of Column

As per Clause 25.4 of IS 456 : 2000, calculate the minimum eccentricity:

For Width \(e_{min} = (2,500/500) + (500/30) = 21.7 \text{ mm} > 20 \text{ mm. (OK)}\)

Hence Minimum Eccentricity is ok.

Check for Maximum Eccentricity of Column

As per Clause 39.3 of IS 456 : 2000 calculate the maximum eccentricity:

For Width \(e_{max} = 0.05 \times 500 = 25 \text{ mm. Hence, } e_{min} < e_{max}(OK)\)

Hence Maximum Eccentricity is ok.

Design for Flexure

Determine the non-dimensional parameters to use with interaction chart 56 of SP 16:

\[P_u / f_{ck}D^2 = 800(10^3) / (20 \times 500^2) = 0.16\]

\[M_u / f_{ck}D^3 = 162.5(10^6) / (20 \times 500^3) = 0.065\]

From the chart, \(P / f_{ck} = 0.06\), and thus \(P = 20 \times 0.06 = 1.2\)

The area of longitudinal reinforcement required then is given by:

\[A_{sc} = \frac{P \times \pi \times D^2}{400} = \frac{1.2 \times \pi \times 500^2}{400} = 2,355 \text{ mm}^2\]

Let assume 20 mm dia bar. So, \(A_{st} = (3.14/4) \times 25^2 = 314 \text{ mm}^2\).

Number of bars = \((2,355/314) = 7.5 \approx 8\) bars

So, the actual reinforcement will be = \(8 \times 314 \text{ mm}^2 = 2,513 \text{ mm}^2\)

As per Clause 26.5.3.2 (c) of IS 456 : 2000 Bar Diameter of Lateral Ties:

\(¼ \times \text{Main Bar dia} = ¼ \times 20 = 5 \text{ mm}\)

or, 6 mm

So, Provide 10 mm dia. bar for lateral ties.

As per Clause 26.5.3.2 (c) of IS 456 : 2000 Pitch of Lateral Ties:

Least lateral dimension = 500 mm

16 \times 20 = 320 mm

300 mm

Provide 10 mm dia. bar @ 300 mm for lateral ties.

***************END OF COLUMN DESIGN RESULTS**************
V. IS456 2000-Doubly Reinforced Rectangular Beam

Verify the design of a rectangular beam per IS 456:2000.

Details

A three story, concrete structure is subject to gravity loads only. Beam 59 is to be designed:

![Beam Diagram]

Section properties:

- Length of beam, $L = 3,000$ mm (clear span)
- Width of beam, $B = 250$ mm
- Depth of beam, $D = 300$ mm
- Clear cover = 30 mm
- Diameter of main reinforcement = 16 mm
- Diameter of stirrups = 8 mm

Material properties:

- Characteristic strength of concrete, $f_{ck} = 20$ $N/mm^2$
- Yield strength of steel, $f_y = 415$ $N/mm^2$

Loads: total uniform force = 50 $kN/m$
Validation

Effective Depth, \( d = 300 - 30 - 8 - (16/2) = 254 \text{ mm} \)

Depth of Compression Reinforcement, \( d' = 30 + (16/2) + 8 = 46 \text{ mm} \)

Design for Flexure

Limiting moment value, \( M_{z,\text{limit}} = 0.138 \times f_{ch} \times B \times d^2 = 44.52 \text{ kN·m} \)

From the STAAD.Pro analysis, \( M_z = 55.44 \text{ kN·m} > M_{z,\text{limit}} \) at the start of the member (\( x = 0 \)).

So, the actual moment is greater than limiting moment then the section will be design as doubly reinforced section.

From SP16 table 50 flexure, reinforcement percentage for doubly reinforced section:

- Percentage of tension reinforcement \( \rho_t = 1.212 \)
- Percentage of compression reinforcement \( \rho_c = 0.288 \)

Reinforcement at Start of Member (\( x = 0 \)): top bars

\[ A_{st, \text{top}_a} = 1.212 \times B \times d / 100 = 769.6 \text{ mm}^2 \]

Provide 4 - 16 mm diameter bars. Actual \( A_{st, \text{top}} = 4 \times \pi / 4 \times (16)^2 = 804.2 \text{ mm}^2 \)

Reinforcement at Start of Member (\( x = 0 \)): bottom bars

\[ A_{st, \text{bot}_a} = 0.288 \times B \times d / 100 = 182.9 \text{ mm}^2 \]

Provide 2 - 16 mm diameter bars. Actual \( A_{st, \text{bot}} = 2 \times \pi / 4 \times (16)^2 = 402.1 \text{ mm}^2 \)

From the STAAD.Pro analysis, \( M_z = 54.11 \text{ kN·m} > M_{z,\text{limit}} \) at the end of the member (\( x = 3 \text{ m} \)).

From SP16 table 50 flexure, reinforcement percentage for doubly reinforced section:

- Percentage of tension reinforcement \( \rho_t = 1.183 \)
- Percentage of compression reinforcement \( \rho_c = 0.256 \)

Reinforcement at End of Member (\( x = 3 \text{ m} \)): top bars

\[ A_{st, \text{top}_b} = 1.183 \times B \times d / 100 = 751.2 \text{ mm}^2 \]

Provide 4 - 16 mm diameter bars. Actual \( A_{st, \text{top}} = 3 \times \pi / 4 \times (16)^2 = 804.2 \text{ mm}^2 \)

Reinforcement at End of Member (\( x = 3 \text{ m} \)): bottom bars

\[ A_{st, \text{bot}_b} = 0.256 \times B \times d / 100 = 162.6 \text{ mm}^2 \]

Provide 2 - 16 mm diameter bars. Actual \( A_{st, \text{bot}} = 2 \times \pi / 4 \times (16)^2 = 402.1 \text{ mm}^2 \)

Design for Shear

Provide percentage of tension steel, \( \rho_t = 1.266 \).

From Table 19 of IS 456:2000, for M20 grade concrete, shear stress: \( T_v = 0.673 \text{ N/mm}^2 \).

Factored shear force as per linear structural analysis in STAAD.Pro, \( F_y = 117.9 \text{ kN} \).

The nominal shear stress, \( T_v = 117.9 / (B \times d) = 117.9 \times 10^2 / (250 \times 254) = 1.86 \text{ N/mm}^2 \).

The maximum shear stress from Table 20 of IS 456:2000 for M20 grade concrete, \( T_{v,\text{max}} = 2.8 \text{ N/mm}^2 \).

Shear strength of the reinforcement: \( V_{us} = F_y \times T_v \times B \times d = 117.9 \times 0.673 \times 250 \times 254 \times 10^3 = 75.16 \text{ kN} \).
Provide 2 legged 8 mm diameter bar. So, the area of shear reinforcement, $A_{sv} = n/4 \times 8^2 \times 2 = 100.5 \text{ mm}^2$.

Using formula of IS 456:2000 spacing for vertical stirrups: $s_v = 0.87 \times (f_y \times A_{sv} \times d) / V_{us} = 122.8 \text{ mm}$.

So, provide 2 legged 8 mm diameter bar stirrups at 100 mm center to center.

### SHEAR DESIGN RESULTS AT DISTANCE d (EFFECTIVE DEPTH) FROM FACE OF THE SUPPORT

**SHEAR DESIGN RESULTS AT 452.0 mm AWAY FROM START SUPPORT**

\[
V_Y = 79.04 \quad M_X = 0.77 \quad L_D = 3
\]

Provide 2 Legged 8d @ 100 mm c/c

**SHEAR DESIGN RESULTS AT 452.0 mm AWAY FROM END SUPPORT**

\[
V_Y = -78.16 \quad M_X = 0.77 \quad L_D = 3
\]
V. IS456 2000-Singly Reinforced Rectangular Beam

Verify the designed results produced by the program with hand calculated design results for a rectangular beam section as per IS456:2000.

Details

A three story, concrete structure is subject to gravity loads only. Beam 59 is to be designed:

![Beam Diagram]

Section properties:

- Length of beam, \( L = 3,000 \, mm \) (clear span)
- Width of beam, \( B = 250 \, mm \)
- Depth of beam, \( D = 300 \, mm \)
- Clear cover = 30 mm
- Diameter of main reinforcement = 12 mm
Diameter of stirrups = 8 mm

Material properties:
- Characteristic strength of concrete, $f_{ck} = 20 \text{ N/mm}^2$
- Yield strength of steel, $f_y = 415 \text{ N/mm}^2$

Loads: total uniform force = 25 kN/m

Validation

Effective Depth, $d = 300 - 30 - 8 - (12/2) = 256 \text{ mm}$

Design for Flexure

Limiting moment value, $M_{z,\text{limit}} = 0.138 \times f_{ck} \times B \times d^2 = 0.138 \times 20 \times 250 \times 256^2 \times 10^6 = 45.22 \text{ kN/m}$

From the STAAD.Pro analysis, $M_z = 30.26 \text{ kN/m} < M_{z,\text{limit}}$ at the start of the member (x = 0).

So, the actual moment is less than limiting moment then the section will be design as singly reinforced section.

From SP16 table 2 flexure, reinforcement percentage for singly reinforced section:

- Percentage of tension reinforcement $\rho_t = 0.583$

Reinforcement at Start of Member (x = 0): top bars

$A_{st} = 0.583 \times B \times d / 100 = 0.583 \times 250 \times 256 / 100 = 373.0 \text{ mm}^2$

Provide 4 - 12 mm diameter bars. Actual $A_{st,\text{top}} = 4 \times (\pi/4) \times (12)^2 = 452.4 \text{ mm}^2$

From the STAAD.Pro analysis, $M_z = 24.57 \text{ kN/m} < M_{z,\text{limit}}$ at the end of the member (x = 3 m).

The actual moment is less than the limiting moment. Thus, the section is designed as a singly reinforced section.

From SP16 table 2 flexure, reinforcement percentage for singly reinforced section:

- Percentage of tension reinforcement $\rho_t = 0.46$

Reinforcement at End of Member (x = 3 m): top bars

$A_{st} = 0.46 \times B \times d / 100 = 0.46 \times 250 \times 256 / 100 = 294.4 \text{ mm}^2$

Provide 3 - 12 mm diameter bars. Actual $A_{st,\text{top}} = 3 \times (\pi/4) \times (12)^2 = 393.3 \text{ mm}^2$

Shear Strength of Concrete

Provide percentage of tension steel, $\rho_t = 0.707$.

From Table 19 of IS 456:2000, for M20 grade concrete, shear stress: $T_v = 0.546 \text{ N/mm}^2$.

Factored shear force as per linear structural analysis in STAAD.Pro, $F_y = 58.15 \text{ kN}$.

The nominal shear stress, $T_v = F_y / (B \times d) = 58.15 / (250 \times 256) = 0.909 \text{ N/mm}^2$.

The maximum shear stress from Table 20 of IS 456:2000 for M20 grade concrete, $T_{v,\text{max}} = 2.8 \text{ N/mm}^2$.

$T_c < T_v < T_{c,\text{max}}$, so provide shear reinforcement.

Shear strength of the reinforcement: $V_{us} = F_y \times T_c \times B \times d = 58.15 \times 0.546 \times 250 \times 256 \times 10^3 = 23.19 \text{ kN}$.

Provide 2 legged 8 mm diameter bar. So, the area of shear reinforcement, $A_{sv} = \pi/4 \times 8^2 \times 2 = 100.5 \text{ mm}^2$.

Using the formula of IS 456:2000, the spacing for vertical stirrups:
\[ S_v = 0.87(F_y \times A_{sv} \times d / V_{us}) = 0.87(250 \times 100.5 \times 256 / 23.19) = 400.7 \text{ mm} \]

Per Cl. 26.5.1.5 of IS 456:2000, the maximum spacing for of shear reinforcement is the least of:

\[ 0.75 \times d = 0.75 \times 256 = 192 \text{ mm} \]

\[ 300 \text{ mm} \]

\[ (0.87 \times f_y \times A_{sv}) / (0.4 \times B) = 393 \text{ mm} \]

\[ S_v = 401 \text{ mm} \]

So, provide 2 legged 8 mm diameter bar stirrups at 190 mm center to center.

### SHEAR DESIGN RESULTS AT DISTANCE d (EFFECTIVE DEPTH) FROM FACE OF THE SUPPORT

**SHEAR DESIGN RESULTS AT 454.0 mm AWAY FROM START SUPPORT**

\[ V_Y = 41.20 \quad M_X = 0.00 \quad L_D = 3 \]

Provide 2 Legged 8d @ 190 mm c/c

**SHEAR DESIGN RESULTS AT 454.0 mm AWAY FROM END SUPPORT**

\[ V_Y = -37.40 \quad M_X = 0.00 \quad L_D = 3 \]

Provide 2 Legged 8d @ 190 mm c/c

***************END OF BEAM DESIGN RESULTS***************

**Related Links**

- [D8.E.5 Beam Design](on page 1668)

**V. IS456 2000-Singly Reinforced Square Beam**

Verify the designed results produced by the program with hand calculated design results for a square beam section as per IS456:2000.
Details

A three story, concrete structure is subject to gravity loads only. Beam 59 is to be designed:

Section properties:
- Length of beam, $L = 3,000 \text{ mm}$ (clear span)
- Width of beam, $B = 300 \text{ mm}$
- Depth of beam, $D = 300 \text{ mm}$
- Clear cover = 30 mm
- Diameter of main reinforcement = 16 mm
- Diameter of stirrups = 8 mm

Material properties:
- Characteristic strength of concrete, $f_{ck} = 20 \text{ N/mm}^2$
- Yield strength of steel, $f_y = 415 \text{ N/mm}^2$

Loads: total uniform force = 35 kN/m

Validation

Effective Depth, $d = 300 - 30 - 8 - (16/2) = 254 \text{ mm}$

Design for Flexure
Limiting moment value, \( M_{z,\text{limit}} = 0.138 \times f_{ck} \times B \times d^2 = 0.138 \times 20 \times 300 \times 254^2 \times 10^6 = 53.42 \text{ kN} \cdot \text{m} \)

From the STAAD.Pro analysis, \( M_z = 40.46 \text{ kN} \cdot \text{m} < M_{z,\text{limit}} \) at the start of the member (\( x = 0 \)).

So, the actual moment is less than limiting moment then the section will be design as singly reinforced section.

From SP16 table 2 flexure, reinforcement percentage for singly reinforced section:

Percentage of tension reinforcement \( \rho_t = 0.674 \)

Reinforcement at Start of Member (\( x = 0 \)): top bars

\[ A_{st} = 0.674 \times B \times d / 100 = 0.674 \times 300 \times 254 / 100 = 513.6 \text{ mm}^2 \]

Provide 3 - 16 mm diameter bars. Actual \( A_{st, \text{top}} = 3 \times (\pi / 4) \times (16)^2 = 603.2 \text{ mm}^2 \)

From the STAAD.Pro analysis, \( M_z = 35.84 \text{ kN} \cdot \text{m} < M_{z,\text{limit}} \) at the end of the member (\( x = 3 \text{ m} \)).

The actual moment is less than the limiting moment. Thus, the section is designed as a singly reinforced section.

From SP16 table 2 flexure, reinforcement percentage for singly reinforced section:

Percentage of tension reinforcement \( \rho_t = 0.585 \)

Reinforcement at Start of Member (\( x = 3 \)): top bars

\[ A_{st} = 0.585 \times B \times d / 100 = 0.585 \times 300 \times 254 / 100 = 445.6 \text{ mm}^2 \]

Provide 3 - 16 mm diameter bars. Actual \( A_{st, \text{top}} = 3 \times (\pi / 4) \times (16)^2 = 603.2 \text{ mm}^2 \)

Shear Strength of Concrete

Provide percentage of tension steel, \( \rho_t = 0.792 \).

From Table 19 of IS 456:2000, for M20 grade concrete, shear stress: \( T_c = 0.57 \text{ N/mm}^2 \).

Factored shear force as per linear structural analysis in STAAD.Pro, \( F_y = 80.29 \text{ kN} \).

The nominal shear stress, \( T_v = F_y / (B \times d) = 80.29 / (300 \times 254) = 1.054 \text{ N/mm}^2 \).

The maximum shear stress from Table 20 of IS 456:2000 for M20 grade concrete, \( T_{c,\text{max}} = 2.8 \text{ N/mm}^2 \).

\( T_c < T_v < T_{c,\text{max}} \), so provide shear reinforcement.

Shear strength of the reinforcement: \( V_{us} = F_y \times A_{sv} \times d / V_{us} = 80.29 \times 100.5 \times 256 / 36.85 = 36.85 \text{ kN} \).

Provide 2 legged 8 mm diameter bar. So, the area of shear reinforcement, \( A_{sv} = \pi / 4 \times 8^2 \times 2 = 100.5 \text{ mm}^2 \).

Using the formula of IS 456:2000, the spacing for vertical stirrups:

\[ S_v = 0.87 \left( F_y \times A_{sv} \times d / V_{us} \right) = 0.87 \times (250 \times 100.5 \times 256 / 36.85) = 250.2 \text{ mm} \]

Per Cl. 26.5.1.5 of IS 456:2000, the maximum spacing for of shear reinforcement is the least of:

\[ 0.75 \times d = 0.75 \times 256 = 191 \text{ mm} \]
\[ 300 \text{ mm} \]
\[ (0.87 \times f_y \times A_{sv}) / (0.4 \times B) = 302.5 \text{ mm} \]

\[ S_v = 250.2 \text{ mm} \]

So, provide 2 legged 8 mm diameter bar stirrups at 190 mm center to center.

**V. IS13920 2016-Singly Reinforced Rectangular Beam**

Verify the design of a rectangular beam per IS 13920:2016.

**Details**

A three story, concrete structure is subject to gravity loads only. Beam 59 is to be designed:
Section properties:

- Length of beam, $L = 3,000 \text{ mm}$ (clear span)
- Width of beam, $B = 250 \text{ mm}$
- Depth of beam, $D = 300 \text{ mm}$
- Clear cover = $30 \text{ mm}$
- Diameter of main reinforcement = $12 \text{ mm}$
- Diameter of stirrups = $8 \text{ mm}$

Material properties:

- Characteristic strength of concrete, $f_{ck} = 20 \text{ N/mm}^2$
- Yield strength of steel, $f_y = 415 \text{ N/mm}^2$

Loads: total uniform force = $25 \text{ kN/m}$

Validation

Effective Depth, $d = 300 - 30 - 8 - (12/2) = 256 \text{ mm}$

Depth of Compression Reinforcement, $d' = 30 + (12/2) + 8 = 44 \text{ mm}$

Check for Member Size

Width to Depth ratio of the member, $B/D = 250/300 = 0.833$ (Clause 6.1.1; IS 13920:2016)
Width of Beam, $B = 250 \text{ mm} > 200 \text{ mm}$ (Clause 6.1.2; IS 13920:2016)

As per clause 6.1.3 of IS 13920:2016, depth of beam shall not have more than $1/4$ of clear span. So, the allowable depth not more than, $L/4 = 3000/4 = 750 \text{ mm} > 300 \text{ mm}$. Hence ok. (Clause 6.1.3; IS 13920:2016)

Width of the supporting member, $C_2 = 400 \text{ mm}$ and Breadth of the supporting member, $C_1 = 400 \text{ mm}$. So, the width of member, $B$, shall not exceed smaller of $(C_2)$ and $(C_1) = 400 \text{ mm}$ or $C_2 +$ smaller of $(C_1)$ and $(C_2) = 800 \text{ mm}$. Hence ok. (Clause 6.1.4; IS 13920:2016)

Check for Axial Stress

Axial force from STAAD.Pro analysis, $F_x = 0.299 \text{ kN}$

Factored axial compressive stress: $F_x / (B \times D) = 0.004 < 0.08f_{ck} = 1.6$, Hence OK (Clause 6.1; IS 13920:2016)

Design for Flexure

Minimum longitudinal reinforcement, $p_{min} = 0.24\times(f_{ck})/f_y \times B \times d = 165.5 \text{ mm}^2$

Maximum longitudinal reinforcement, $p_{max} = 0.025 \times B \times d = 1,600 \text{ mm}^2$

Limiting moment value, $M_{z,limit} = 0.138 f_{ck} \times B \times d^2 = 45.22 \text{ kN} \cdot \text{m}$

From the STAAD.Pro analysis, $M_z = 30.28 \text{ kN} \cdot \text{m} < M_{z,limit}$ at the start of the member ($x = 0$).

From SP 16 table 2 flexure, reinforcement percentage for singly reinforced section:

- Percentage of tension reinforcement $p_t = 0.583$
- Percentage of compression reinforcement $p_c = 0.292$

Reinforcement at Start of Member ($x = 0$): top bars

$$A_{st, top, a} = 0.583 \times B \times d / 100 = 373.1 \text{ mm}^2$$

Provide 4 - 12 mm diameter bars. Actual $A_{st, top} = 4 \times (\pi/4) \times (12)^2 = 452.4 \text{ mm}^2$

Thus, clause 6.2.1(b) and 6.2.2 of IS 13920:2016 are satisfied.

Reinforcement at Start of Member ($x = 0$): bottom bars

$$A_{st, bot, a} = 0.292 \times B \times d / 100 = 186.9 \text{ mm}^2$$

Provide 2 - 12 mm diameter bars. Actual $A_{st, bot} = 2 \times (\pi/4) \times (12)^2 = 226.2 \text{ mm}^2$

Thus, clause 6.2.1(b) and 6.2.2 of IS 13920:2016 are satisfied.

From the STAAD.Pro analysis, $M_z = 24.56 \text{ kN} \cdot \text{m} < M_{z,limit}$ at the end of the member ($x = 3 \text{ m}$).

From SP 16 table 2 flexure, reinforcement percentage for singly reinforced section:

- Percentage of tension reinforcement $p_t = 0.451$
- Percentage of compression reinforcement $p_c = 0.225$

Reinforcement at End of Member ($x = 3 \text{ m}$): top bars

$$A_{st, top, b} = 0.451 \times B \times d / 100 = 288.6 \text{ mm}^2$$

Provide 3 - 12 mm diameter bars. Actual $A_{st, top} = 3 \times (\pi/4) \times (12)^2 = 339.3 \text{ mm}^2$

Thus, clause 6.2.1(b) and 6.2.2 of IS 13920:2016 are satisfied.

Reinforcement at End of Member ($x = 3 \text{ m}$): bottom bars

$$A_{st, bot, b} = 0.225 \times B \times d / 100 = 144 \text{ mm}^2$$
Provide 2 - 12 mm diameter bars. Actual $A_{st, bot} = 2 \times (\pi/4) \times (12)^2 = 226.2 \text{ mm}^2$

Thus, clause 6.2.1(b) and 6.2.2 of IS 13920:2016 are satisfied.

As per clause 6.2.4 of IS 13920:2016, any intermediate section, on top or bottom face should have at least $452.4 \text{ mm}^2 / 4 = 113.1 \text{ mm}^2$ of steel as the main reinforcement. So the provided reinforcement satisfies this condition.

**Design for Shear**

Calculation of resistance moment based on the area of steel provided:

Sagging resistance moment at start:

$$M_{z,as} = 0.87 \times f_y \times A_{st,bot,a} \times d \times [1 - A_{st,bot,a} \times f_y / (B \times d \times f_{ck})] = 19.37 \text{ kN m}$$

Hogging resistance moment at start:

$$M_{z,ah} = 0.87 \times f_y \times A_{st,top,a} \times d \times [1 - A_{st,top,a} \times f_y / (B \times d \times f_{ck})] = 35.68 \text{ kN m}$$

Sagging resistance moment at end:

$$M_{z,bs} = 0.87 \times f_y \times A_{st,bot,b} \times d \times [1 - A_{st,bot,b} \times f_y / (B \times d \times f_{ck})] = 19.37 \text{ kN m}$$

Hogging resistance moment at end:

$$M_{z,bh} = 0.87 \times f_y \times A_{st,top,b} \times d \times [1 - A_{st,top,b} \times f_y / (B \times d \times f_{ck})] = 27.91 \text{ kN m}$$

Simple shear from gravity load on the span:

$$V_a = 1.2 \times 25 \text{ kN/m} \times 3/2 = 45 \text{ kN}$$

Factor shear force as per linear structural analysis in STAAD.Pro, $F_y = 58.16 \text{ kN}$

Calculation of shear force due to formation of plastic hinge at both ends of the beam plus the factored gravity load on the span.

For sway to right:

$$V_{u,ar} = V_a \times 1.4 \times (M_{z,as} + M_z \times b \times h/3) = 22.93 \text{ kN}$$

$$V_{u,bv} = V_a + 1.4 \times (M_{z,as} + M_z \times b \times h/3) = 67.01 \text{ kN}$$

For sway to left:

$$V_{u,al} = V_a + 1.4 \times (M_{z,as} + M_z \times b \times h/3) = 70.69 \text{ kN}$$

$$V_{u,bl} = V_a - 1.4 \times (M_{z,as} + M_z \times b \times h/3) = 19.31 \text{ kN}$$

Design shear force at start: $V_{ua} = 70.69 \text{ kN}$

Design shear force at end: $V_{ub} = 67.01 \text{ kN}$

Design shear force, $V_{ua} = 70.69 \text{ kN}$ (Considering clause 6.3.4(c) of IS13920:2016)

Provide 2 legged 8 mm diameter bar. Thus the area of shear reinforcement:

$$A_v = 2 \times (\pi/4) \times (8)^2 = 100.5 \text{ mm}^2$$

Using the formula from IS 456:2000, the spacing for vertical stirrups is:

$$S_v = 0.87 \times f_y \times A_{sh} \times d / V_{ua} = 131.4 \text{ mm}$$

Per clause 6.3.5 of IS13920:2016, the spacing of the links over a length of $2d$ at either end of the beam shall be the least of:

a. $d / 4 = 64 \text{ mm}$
b. $6 \times$ bar diameter of the smallest bars = $6 \times 12 = 72$ mm

c. 100 mm

d. $S_u = 131$ mm

Thus, it should be not greater than 64 mm. Therefore, provide 2 legged - 8 mm links @ 60 mm center to center at left and right end over a length of $2d = 512$ mm.

Per Clause 6.3.5.2 of IS13920:2016, the spacing of the stirrups in the mid-span shall not exceed $d/2 = 128$ mm. Thus, use a spacing of 125 mm elsewhere.

Verification Examples

V.10 Concrete Design
### Design Shear Force Results

**At Section 0.0:** 70.44 KN

**At Section 3000.0:** 66.86 KN

**Note:**
- Moment of resistance is calculated based on the area of steel provided. If the area of steel provided is much higher compared to area of steel required, the moment of resistance will increase which may increase design shear force.

---

### Shear Design Results

- **At Distance 2d (Twice Effective Depth) from Face of the Support:**
  - **At 708.0 mm away from Start Support:**
    - $V_Y = 31.76, M_X = 0.00, LD= 3$
    - Provide 2 Legged 8d @ 60 mm c/c
  - **At 708.0 mm away from End Support:**
    - $V_Y = -27.94, M_X = 0.00, LD= 3$
    - Provide 2 Legged 8d @ 60 mm c/c
V. IS13920 2016-Doubly Reinforced Rectangular Beam

Verify the design of a rectangular beam per IS 13920:2016.

Details

A three story, concrete structure is subject to gravity loads only. Beam 59 is to be designed:

Section properties:

- Length of beam, $L = 3,000 \text{ mm}$ (clear span)
- Width of beam, $B = 250 \text{ mm}$
- Depth of beam, $D = 300 \text{ mm}$
- Clear cover = $30 \text{ mm}$
- Diameter of main reinforcement = $16 \text{ mm}$
Diameter of stirrups = 8 mm

Material properties:
- Characteristic strength of concrete, $f_{ck} = 20 \text{ N/mm}^2$
- Yield strength of steel, $f_y = 415 \text{ N/mm}^2$

Loads: total uniform force = 50 kN/m

Validation

Effective Depth, $d = 300 - 30 - 8 - (16/2) = 254 \text{ mm}$

Depth of Compression Reinforcement, $d' = 30 + (16/2) + 8 = 46 \text{ mm}$

Check for Member Size

Width to Depth ratio of the member, $B/D = 250/300 = 0.833$ (Clause 6.1.1; IS 13920:2016)

Width of Beam, $B = 250 \text{ mm} > 200 \text{ mm}$ (Clause 6.1.2; IS 13920:2016)

As per clause 6.1.3 of IS 13920:2016, depth of beam shall not have more than 1/4 of clear span. So, the allowable depth not more than, $L/4 = 3000/4 = 750 \text{ mm} > 300 \text{ mm}$. Hence ok. (Clause 6.1.3; IS 13920:2016)

Width of the supporting member, $C_2 = 400 \text{ mm}$ and Breadth of the supporting member, $C_1 = 400 \text{ mm}$. So, the width of member, $B$, shall not exceed smaller of ($C_2$) and ($C_1$) = 400 mm or $C_2 +$ smaller of ($C_1$) and ($C_2$) = 800 mm. Hence ok. (Clause 6.1.4; IS 13920:2016)

Axial force from STAAD.Pro analysis, $F_x = 6.805 \text{ kN}$

Factored axial compressive stress: $F_x / (B\times D) = 0.09 < 0.08f_{ck} = 1.6$, Hence OK (Clause 6.1; IS 13920:2016)

Design for Flexure

Minimum longitudinal reinforcement, $p_{min} = 0.24\sqrt{(f_{ck})/f_y}\times B\times d = 164.2 \text{ mm}^2$

Maximum longitudinal reinforcement, $p_{max} = 0.025\times B\times d = 1,588 \text{ mm}^2$

Limiting moment value, $M_{z,limit} = 0.138f_{ck}\times B\times d^2 = 44.52 \text{ kN} \cdot \text{m}$

From the STAAD.Pro analysis, $M_z = 55.44 \text{ kN} \cdot \text{m} > M_{z,limit}$ at the start of the member $(x = 0)$.

So, the actual moment is greater than limiting moment then the section will be design as doubly reinforced section.

From SP16 table 50 flexure, reinforcement percentage for doubly reinforced section:

- Percentage of tension reinforcement $p_t = 1.19$
- Percentage of compression reinforcement $p_c = 0.595$

Reinforcement at Start of Member $(x = 0)$: top bars

$$A_{st,top,a} = 1.19\times B\times d/100 = 755.7. \text{ mm}^2$$

Provide 4 - 16 mm diameter bars. Actual $A_{st,top} = 4\times(\pi/4)\times(16)^2 = 804.2 \text{ mm}^2$

Thus, clause 6.2.1(b) and 6.2.2 of IS 13920:2016 are satisfied.

Reinforcement at Start of Member $(x = 0)$: bottom bars

$$A_{st,bot,a} = 0.595\times B\times d/100 = 377.8. \text{ mm}^2$$

Provide 2 - 16 mm diameter bars. Actual $A_{st,bot} = 2\times(\pi/4)\times(16)^2 = 402.1 \text{ mm}^2$
Thus, clause 6.2.1(b) and 6.2.2 of IS 13920:2016 are satisfied.

From the STAAD.Pro analysis, $M_z = 54.11 \text{kN} \cdot \text{m} > M_{z,\text{limit}}$ at the end of the member (x = 3 m).

From SP16 table 50 flexure, reinforcement percentage for doubly reinforced section:

Percentage of tension reinforcement $p_t = 1.161$ and compression reinforcement $p_c = 0.581$.

Reinforcement at End of Member (x = 3 m): top bars

$$A_{\text{st, top}_b} = 1.161 \times B \times d / 100 = 737.4 \text{ mm}^2$$

Provide 4 - 16 mm diameter bars. Actual $A_{\text{st, top}} = 3 \times (\pi / 4) \times (16)^2 = 804.2 \text{ mm}^2$

Thus, clause 6.2.1(b) and 6.2.2 of IS 13920:2016 are satisfied.

Reinforcement at End of Member (x = 3 m): bottom bars

$$A_{\text{st, bot}_b} = 0.225 \times B \times d / 100 = 368.7 \text{ mm}^2$$

Provide 2 - 16 mm diameter bars. Actual $A_{\text{st, bot}} = 2 \times (\pi / 4) \times (16)^2 = 402.1 \text{ mm}^2$

Thus, clause 6.2.1(b) and 6.2.2 of IS 13920:2016 are satisfied.

As per clause 6.2.4 of IS 13920:2016, any intermediate section, on top or bottom face should have at least $804.2 \text{ mm}^2 / 4 = 201.1 \text{ mm}^2$ of steel as the main reinforcement. So the provided reinforcement satisfies this condition.

**Design for Shear**

Calculation of resistance moment based on the area of steel provided:

Sagging resistance moment at start:

$$M_{z,\text{as}} = 0.87 \times f_y \times A_{\text{st, bot}_a} \times d \times [1 - A_{\text{st, bot}_a} \times f_y / (B \times d \times f_{\text{ck}})] = 32.03 \text{ kN} \cdot \text{m}$$

Hogging resistance moment at start:

$$M_{z,\text{ah}} = 0.87 \times f_y \times A_{\text{st, top}_a} \times d \times [1 - A_{\text{st, top}_a} \times f_y / (B \times d \times f_{\text{ck}})] = 54.37 \text{ kN} \cdot \text{m}$$

Sagging resistance moment at end:

$$M_{z,\text{bs}} = 0.87 \times f_y \times A_{\text{st, bot}_b} \times d \times [1 - A_{\text{st, bot}_b} \times f_y / (B \times d \times f_{\text{ck}})] = 32.03 \text{ kN} \cdot \text{m}$$

Hogging resistance moment at end:

$$M_{z,\text{bh}} = 0.87 \times f_y \times A_{\text{st, top}_b} \times d \times [1 - A_{\text{st, top}_b} \times f_y / (B \times d \times f_{\text{ck}})] = 54.37 \text{ kN} \cdot \text{m}$$

Simple shear from gravity load on the span:

$$V_a = 1.2 \times 50 \text{ kN/m} \times 3/2 = 90 \text{ kN}$$

Factor shear force as per linear structural analysis in STAAD.Pro, $F_y = 112.9 \text{ kN}$

Calculation of shear force due to formation of plastic hinge at both ends of the beam plus the factored gravity load on the span.

For sway to right:

$$V_{u,\text{ar}} = V_a \times 1.4 \times (M_{z,\text{as}} + M_z \times b \times h / 3) = 49.68 \text{ kN}$$

$$V_{u,\text{br}} = V_a + 1.4 \times (M_{z,\text{as}} + M_z \times b \times h / 3) = 130.3 \text{ kN}$$

For sway to left:

$$V_{u,\text{al}} = V_a + 1.4 \times (M_{z,\text{as}} + M_z \times b \times h / 3) = 130.3 \text{ kN}$$

$$V_{u,\text{bl}} = V_a \times 1.4 \times (M_{z,\text{as}} + M_z \times b \times h / 3) = 49.68 \text{ kN}$$
Design shear force at start: $V_{ua} = 130.3 \text{ kN}$
Design shear force at end: $V_{ub} = 130.3 \text{ kN}$
Design shear force, $V_{ua} = 130.3 \text{ kN}$ (Considering clause 6.3.4(c) of IS13920:2016)
Provide 2 legged 8 mm diameter bar. Thus the area of shear reinforcement:
$$A_v = 2\times(n/4)\times(8)^2 = 100.5 \text{ mm}^2$$
Using the formula from IS 456:2000, the spacing for vertical stirrups is:
$$S_v = 0.87\times f_v \times A_{sv} \times d / V_{ua} = 70.7 \text{ mm}$$
Per clause 6.3.5 of IS13920:2016, the spacing of the links over a length of $2d$ at either end of the beam shall be the least of:
- a. $d/4 = 64 \text{ mm}$
- b. $6 \times$ bar diameter of the smallest bars $= 6 \times 16 = 96 \text{ mm}$
- c. $100 \text{ mm}$
- d. $S_v = 71 \text{ mm}$
Thus, it should be not greater than 64 mm. Therefore, provide 2 legged - 8 mm links @ 60 mm center to center at left and right end over a length of $2d = 508 \text{ mm}$.
Per Clause 6.3.5.2 of IS13920:2016, the spacing of the stirrups in the mid-span shall not exceed $d/2 = 127 \text{ mm}$. Thus, use a spacing of 125 mm elsewhere.

*** DESIGN SHEAR FORCE AT SECTION 0.0 IS 133.30 KN. ***

*** DESIGN SHEAR FORCE AT SECTION 3000.0 IS 133.30 KN. ***

Note:
- MOMENT OF RESISTANCE IS CALCULATED BASED ON THE AREA OF STEEL PROVIDED. IF AREA OF STEEL PROVIDED IS MUCH HIGHER COMPARED TO AREA OF STEEL REQUIRED MOMENT OF RESISTANCE WILL INCREASE WHICH MAY INCREASE DESIGN SHEAR FORCE.

### V. IS13920 2016-Relative Strength Check

Verify the relative strength of beams and columns at a joint as per clause 7.2 of IS 13920:2016.

**Details**

Check the relative strength of beams and columns at joint 2 for the two-story structure shown.
The beams on each side of the joint are 400 mm × 400 mm square sections and are 5 m long. The columns above and below the joint are 400 mm × 400 mm square sections and are 3 m tall. The clear cover for both beams and columns is 30 mm on all faces.

Material properties:

- Characteristic strength of concrete, $f_{ck} = 30 \text{ N/mm}^2$
- Yield strength of steel, $f_y = 415 \text{ N/mm}^2$

Validation

Columns Strength

From Output file, Moment of Resistance based on reinforcement provided for column no. 22 along global X direction ($M_{x21}$) = 129.99 kN-m.

From Output file, Moment of Resistance based on reinforcement provided for column no. 1 along global X direction ($M_{x22}$) = 149.74 kN-m.

Total Moment of Resistance for column no. 1 and 22 along global X direction

$$M_{ux} = (M_{x21}) + (M_{x22}) = 129.99 + 149.74 = 279.73 \text{ KN-m}.$$ 

From Output file, Moment of Resistance based on reinforcement provided for column no. 22 along global Z direction ($M_{y21}$) = 129.99 kN-m.

From Output file, Moment of Resistance based on reinforcement provided for column no. 1 along global Z direction ($M_{y22}$) = 149.74 kN-m.

Total Moment of Resistance for column no. 1 and 22 along global Z direction

$$M_{uy} = (M_{uy1}) + (M_{uy2}) = 129.99 + 149.74 = 279.73 \text{ KN-m}.$$
Beams Strength

From output file, Moment of Resistance of Beam no. 2 due to hogging moment at start 55.48 kN-m.

From output file, Moment of Resistance of Beam no. 2 due to sagging moment at start 55.48 kN-m.

From output file, Moment of Resistance of Beam no. 9 due to hogging moment at start 208.14 kN-m.

From output file, Moment of Resistance of Beam no. 9 due to sagging moment at start 117.32 kN-m.

Total Moment of Resistance of Beam at joint no. 2 along global X direction

\[ \text{Max}\ (\text{Beam no.2 hogging moment } + \text{ Beam no.9 sagging moment}),\ (\text{Beam no.2 sagging moment } + \text{ Beam no.9 hogging moment}) \]

\[ \text{Max}\ \{(55.48 + 117.32),(55.48 + 208.14)\} = 263.62\ \text{kN-m} \]

From output file, Moment of Resistance of Beam no. 4 due to hogging moment at start 55.48 kN-m.

From output file, Moment of Resistance of Beam no. 4 due to sagging moment at start 55.48 kN-m.

Beam is not extended in global (-Z) direction. So, taking zero hogging and sagging moment at global (-Z) direction

Total Moment of Resistance of Beam at joint no. 2 along global Z direction

\[ \text{Max}\ \{(\text{Beam no.4 hogging moment } + \text{ 0 }),\ (\text{Beam no.4 sagging moment } + \text{ 0 })\} = 55.48\ \text{kN-m} \]

Checking Joint status for global X direction

As per Clause 7.2 of IS 13920 : 2016

Total Column Strength at joint no. 2 along global X direction should be greater than or equal to 1.4 times Maximum Beam strength at joint no. 2 along global X direction

\[ M_{ux} = 279.73 < 1.4 \times 263.62 = 369.068 \]

So, the joint no. 2 is falling along global X direction as per Clause 7.2 of IS 13920 : 2016.

Checking Joint status for global Z direction

As per Clause 7.2 of IS 13920 : 2016

Total Column Strength at joint no. 2 along global Z direction should be greater than or equal to 1.4 times Maximum Beam strength at joint no. 2 along global Z direction

\[ M_{uz} = 279.73 < 1.4 \times 55.48 = 77.672 \]

So, the joint no. 2 is passing along global Z direction as per Clause 7.2 of IS 13920 : 2016.

## V. United States

### V. ACI 318-14 Circular Column

Calculate the axial capacity of a circular column subjected to axial compressive force, given $A_{st}$

#### Details

A circular, cantilever column of length 5ft with an ultimate axial load of 500 kip has the following concrete and steel properties.

- Compressive strength of concrete (normal weight concrete), $f_c = 4,000$ psi
- Yield strength of steel, $f_y = 60,000$ psi
- Clear spacing for outermost bottom reinforcement to bottom face, $C_c = 1.5$ in
- Diameter of column, $D = 20$ in
- Strength reduction factor, $\phi = 0.65$
- Number of #8 bars, $N = 6$
- Rebar diameter for #8 bar, $d = 1$ in

Factored axial load (axial demand), $P_u = 500$ kip

#### Validation

Gross area of concrete section, $A_{g} = \pi D^2 / 4 = 314.159 \text{ in}^2$

Total area of steel reinforcement, $A_{st} = \left(\pi d^2 / 4\right) N = 4.712 \text{ in}^2$

Nominal axial strength at zero eccentricity:

$$P_0 = 0.85 \times f_c (A_g - A_{st}) + f_y A_{st} = 1.335 \times 10^3 \text{ kip}$$

For tied reinforced column:

$$P_{n(max)} = 0.8 \times P_0 = 1.068 \times 10^3 \text{ kip}$$

Capacity $= \phi P_{n(max)} = 694.129 \text{ kip}$

Ratio $= P_u / \phi P_{n(max)} = 0.72$

### V. ACI 318-14 Rectangular Column

Calculate the axial capacity of a rectangular column subjected to axial compressive force, given Ast

**Details**

A rectangular, cantilever column of length 5ft with an ultimate axial load of 1,538 kip has the following concrete and steel properties.

- Compressive strength of concrete (normal weight concrete), $f_c = 5,000$ psi
- Yield strength of steel, $f_y = 60,000$ psi
- Clear spacing for outermost bottom reinforcement to bottom face, $C_c = 1.5$ in
- Width of column, $B = 20$ in
- Depth of column, $D = 30$ in
- Strength reduction factor, $\phi = 0.65$
- Number of #9 bars = 10
- Rebar diameter for #9 bar, $\Omega_d = 1.128$ in

Factored axial load (axial demand), $P_u = 1,538$ kip

**Validation**

Gross area of concrete section, $A_g = B \times D = 600$ in$^2$

Total area of steel reinforcement, $A_{st} = 10$ in$^2$

Nominal axial strength at zero eccentricity:

$$P_0 = 0.85 \times f_c (A_g - A_{st}) + f_y A_{st} = 3.108 \times 10^3 \text{ kip}$$

For tied reinforced column:

$$P_{n(max)} = 0.8 \times P_0 = 2.486 \times 10^3 \text{ kip}$$

Capacity = $\phi P_{n(max)} = 1,615.9$ kip

Ratio = $P_u / \phi P_{n(max)} = 0.952$

## V. ACI 318-14 Square Column

Calculate the axial capacity of a square column subjected to an axial compressive force, given $A_{st}$.

### Details

A square, cantilever column of length 5ft with an ultimate axial load of 998 kip has the following concrete and steel properties.

- Compressive strength of concrete (normal weight concrete), $f_c = 5,000\, \text{psi}$
- Yield strength of steel, $f_y = 60,000\, \text{psi}$
- Clear spacing for outermost bottom reinforcement to bottom face, $C_c = 1.5\, \text{in}$
- Width of column, $B = 20\, \text{in}$
- Depth of column, $D = 20\, \text{in}$
- Strength reduction factor, $\phi = 0.65$
- Number of #9 bars = 4
- Rebar diameter for #9 bar, $\phi_d = 1.128\, \text{in}$

Factored axial load (axial demand), $P_u = 998\, \text{kip}$

### Validation

Gross area of concrete section, $A_g = B \times D = 400\, \text{in}^2$

Total area of steel reinforcement, $A_{st} = 4\, \text{in}^2$

Nominal axial strength at zero eccentricity:

$$P_0 = 0.85 f_c (A_g - A_{st}) + f_y A_{st} = 1.923 \times 10^3\, \text{kip}$$
For tied reinforced column:

\[ P_{n(\text{max})} = 0.8 \times P_0 = 1.5384 \times 10^3 \text{ kip} \]

Capacity = \( \phi P_{n(\text{max})} = 999.96 \text{ kip} \)

Ratio = \( \frac{P_u}{\phi P_{n(\text{max})}} = 0.998 \)

**Results**

V. ACI 318-14 Tee Beam

Calculate the flexural capacity of a T-beam subjected to major axis moment, given Ast

References

1. ACI 318-14: Sections 19.2.1, 20.2.2, 22.3, and 22.4; Tables 22.2.2.4.3, 22.4.2.1, 27.3.2.1
2. PCA Notes 2011: Tables 6.1, 7.1

Related Links

• D1.F.4 Beam Design (on page 1208)

Details

A T-beam of length 5ft is subjected to a major axis moment has the following concrete and steel properties.

- Width of T flange, \( B_f = 30 \text{ in} \)
- Depth of T, \( D = 26 \text{ in} \)
- Thickness of flange, \( T_f = 4 \text{ in} \)
- Thickness of web, \( T_w = 10 \text{ in} \)
- Steel modulus of elasticity, \( E_s = 29,000 \text{ ksi} \)
- Ultimate strain, \( \varepsilon_u = 0.003 \)
- Yield strength of reinforcing steel, \( f_y = 60 \text{ ksi} \)
Compressive strength of concrete (normal weight concrete), $f_c = 4,000$ psi
Clear spacing for outermost bottom reinforcement to bottom face, $C_c = 1.5$ in
Strength reduction factor, $\phi = 0.9$
Rebar diameter for #10 bar, $\Omega d = 1.27$ in

Validation

$$d = D - C_c - \frac{\Omega d}{2} = 23.865$$
$$d' = C_c + \frac{\Omega d}{2} = 2.135$$
$$R_n = \frac{6,400}{\phi \times 0.85 \times f_c \times B_f \times d^2} = 0.122$$

From Table 7.1 of PCA (ref. 2):

$$w = \frac{(0.1726 - 0.1648)}{(0.19 - 0.18)} \times (R_n - 0.1648) + 0.18 = 0.147$$
$$a = 1.18 \times w \times d = 4.138 > T_f ,$$ hence beam acts as a T

Compression strength of the flange:

$$C_f = 0.85 \times f_c \times (B_f + T_w) \times T_f = 136$$
$$A_{sf} = C_f f_y = 2.267 \text{ in}^2$$
this is the required area to equilibrate $C_f$.

Flexural strength of the flange:

$$M_{nw} = \frac{6,400}{\phi} - M_{nf} = 4.001 \times 10^{-3} \text{ in} \cdot \text{k}$$

To check whether this section is tension controlled, refer to PCA Table 7.1 (ref. 2):

$$R_n = \frac{M_{nw}}{f_c \times T_w \times d^2} = 0.176$$
$$w = \frac{(0.1802 - 0.1726)}{(0.2 - 0.19)} \times (R_n - 0.1726) + 0.19 = 0.192$$
$$\rho = \frac{f_c}{w T_y} = 0.013 < 0.01806$$

based on PCA Table 6.1 (ref. 2), thus the section is tension controlled.

$$A_{sw} = \rho \times T_w \times d = 3.06 \text{ in}^2$$

Assume 6- #10 bars, divided between top and bottom: $A_{st,tot} = 6 \times 1.27 \text{ in}^2 = 7.62 \text{ in}^2$

$$a_w = \left( A_{st,tot} - A_{sf} \right) \frac{f_y}{0.85 \times f_c \times T_w} = 9.447 \text{ in}$$

$$M_n = (A_{st,tot} - A_{sf}) \times f_y \left( d - \frac{a_w}{2} \right) + A_{sf} \times f_y \times \left( d - \frac{T_f}{2} \right) = 9,258 \text{ in} \cdot \text{k}$$
$$\phi M_n = 8,332 \text{ in} \cdot \text{k} = 694.4 \text{ ft} \cdot \text{k}$$

V. ACI 318-14 Rectangular Beam without Torsion

Design of a doubly reinforced rectangular beam.

Reference

1. ACI 318-14
2. PCA Notes 2011 Example 6.2

Related Links

• D1.F.4 Beam Design (on page 1208)

Details

To determine the Required Area of Tension and Compression Reinforcement for given Concrete and Steel Properties with Given Factored Moment.

Design of Rectangular Beam with Compression Reinforcement-Doubly Reinforced

A beam cross-section is limited to size 14in X 23 in. Determine the required area of reinforcement for a factored moment \( \mu = 516 \text{ ft-kips} \), \( f_c = 4000 \text{psi} \), \( f_y = 60,000 \text{ psi} \).

Design Properties, available:

Validation

\( d_{cover} = 2.5 \text{ in} \)

Step 1: Check if compression reinforcement is required, using \( Z = 0.9 \).

See table 6-1 of PCA Notes (ref. 2).
Section Stress Block

\[ b = 14'' \]
\[ d' = 2.5'' \]
\[ d_t = 20.5'' \]
\[ c = 0.375d_t = 0.375d = 7.687'' \]
\[ \epsilon_u = 0.003 \]
\[ \epsilon_s = 0.00202 \]
\[ \epsilon_s = 0.005 > \epsilon_y = 0.00207 \]

Note: Assume \( d = d_t \)

**Note:** Assume \( d = d_t \)

\[ M_n = M_u/Z = 573.33 \text{ ft-kip} \]
\[ R_n = M_n / (b*d^2) = 1.169(10)^3 \text{ psi} \]
\[ R_{nt} = 911 \text{ psi} \]

**Note:** \( R_{nt} = \text{Maximum } R_n \text{ for tension controlled section for that particular grade for concrete.} \)

\[ R_n > R_{nt} \]

Hence, both compression and tension reinforcement is required.

**Step 2: Determine maximum moment with compression reinforcement.**

\[ M_{nt} \]

This condition corresponds to tension controlled limit \((Z = 0.9)\).

Depth of neutral axis, \( c = 0.375dt = 0.375d = 7.687'' \)

\[ \beta_1 = 0.85 \] (from table 6.1 (ref. 2))

\[ a = \beta_1*c = 6.534'' \]

Compressive force, \( C = 0.85 f_c \cdot a \cdot b = 311.036 \text{ kips} \)

Tension force, \( T = C = 311.036 \text{ kips} \)

Nominal moment strength resisted by the concrete section, without compression reinforcement, \( M_{nt} = T(d - a/2) = 446.669 \text{ ft-kips} \)

Nominal moment strength resisted by the concrete section, with compression reinforcement, \( M_{nc} = M_{nt} = 126.664 \text{ ft-kips} \)
Step 3: Determine area of tension steel

Area of tension steel required, $A_{s,nt}$, to develop $M_{nt}$

$$A_{s,nt} = \frac{T}{f_y} = 5.184 \text{ in}^2$$

Step 4: Determine additional area of tension steel required

Area of tension steel required, $A_{s,\text{additional}}$, required to counteract additional moment due to T-C couple.

$$A_{s,\text{additional}} = \frac{(M_n - M_{nt})}{f_y \cdot (d - d_{cover})} = 1.407 \text{ in}^2$$

Total tension steel required:

$$A_s = A_s + A_{s,nt} = 6.591 \text{ in}^2$$

Comparison

Table 868: Comparison of results

</tr>
<tr>
<td>Area Required (tension) (in²)</td>
<td>6.591</td>
<td>6.355</td>
<td>3.6%</td>
<td>See note (*) below.</td>
</tr>
</tbody>
</table>

Note: (*) The required steel calculation above assumes a single layer of bottom bars and the effective depth = 0.375*dt based on the single bar layer. The reference (ref. 2) calculations only considers a strength design and does not check for the minimum spacing requirements. STAAD.Pro however considers two layers of bars in the design to account for the minimum criteria and hence uses a neutral axis position based on the two bar layers. Hence the minor difference in the steel areas calculated.

V. ACI 318-11 Circular Column

Calculate the axial capacity of a circular column subjected to axial compressive force, given Ast

References
ACI 318-11

Related Links
• D1.F.5.6 Column Design in Pre-2014 Codes (on page 1232)

Details
A circular, cantilever column of length 5ft with an ultimate axial load of 500 kip has the following concrete and steel properties.

- Compressive strength of concrete (normal weight concrete), $f_c = 4,000$ psi
- Yield strength of steel, $f_y = 60,000$ psi
- Clear spacing for outermost bottom reinforcement to bottom face, $C_c = 1.5$ in
- Diameter of column, $D = 20$ in
- Strength reduction factor, $\phi = 0.65$
- Number of #8 bars, $N = 6$
- Rebar diameter for #8 bar, $d = 1$ in

Factored axial load (axial demand), $P_u = 500$ kip

Validation
Gross area of concrete section, $A_g = \pi D^2 / 4 = 314.159$ in$^2$

Total area of steel reinforcement, $A_{st} = \left( \pi d^2 / 4 \right) \times N = 4.712$ in$^2$

Nominal axial strength at zero eccentricity:

$$P_0 = 0.85 \times f_c (A_g - A_{st}) + f_y \times A_{st} = 1.335 \times 10^3 \text{ kip}$$

For tied reinforced column:

$$P_{n(max)} = 0.8 \times P_0 = 1.068 \times 10^3 \text{ kip}$$

Capacity = $\phi P_{n(max)} = 694.129$ kip

Ratio = $P_u / \phi P_{n(max)} = 0.72$

V. ACI 318-11 Square Column

Calculate the axial capacity of a square column subjected to an axial compressive force, given Ast

Details

A square, cantilever column of length 5ft with an ultimate axial load of 998 kip has the following concrete and steel properties.
Compressive strength of concrete (normal weight concrete), $f_c = 5,000$ psi
Yield strength of steel, $f_y = 60,000$ psi
Clear spacing for outermost bottom reinforcement to bottom face, $C_c = 1.5$ in
Width of column, $B = 20$ in
Depth of column, $D = 20$ in
Strength reduction factor, $\phi = 0.65$
Number of #9 bars = 4
Rebar diameter for #9 bar, $\phi_d = 1.128$ in

Factored axial load (axial demand), $P_u = 998$ kip

Validation
Gross area of concrete section, $A_g = B \times D = 400$ in$^2$
Total area of steel reinforcement, $A_{st} = 4$ in$^2$
Nominal axial strength at zero eccentricity:
$$P_0 = 0.85 \times f_c (A_g - A_{st}) + f_y \times A_{st} = 1.923 \times 10^3$$ kip
For tied reinforced column:
$$P_{n(max)} = 0.8 \times P_0 = 1.5384 \times 10^3$$ kip
Capacity $= \phi P_{n(max)} = 999.96$ kip
Ratio $= P_u / \phi P_{n(max)} = 0.998$

#### V.10 Concrete Design

### Related Links
- **D1.F.5.6 Column Design in Pre-2014 Codes** (on page 1232)

### V. ACI 318-11 Rectangular Singly Reinforced Beam

Design of a singly reinforced concrete beam per the ACI 318-2011 code.

### References

1. ACI 318-11
2. PCA Notes 2011: Example 7.1

### Related Links
- **D1.F.4.6 Beam Design per ACI 318-11 and Earlier** (on page 1217)

### Details

Determine the Required Area of Tension Reinforcement for given Concrete and Steel Properties with Given Factored Moment.
Select a rectangular beam size and required reinforcement to carry service load moments $M_{DL} = 56 \text{ ft-kips}$ and $M_{LL} = 35 \text{ ft-kips}$. Select reinforcement to control flexural cracking.

A 10' simply supported beam is subjected to an ultimate uniform load of 9.736 k/ft.

- $f'_c = 4,000 \text{ psi}$
- $f_y = 60,000 \text{ psi}$
- cover = 2 in

**Validation**

This is a complete design procedure for rectangular sections with tension reinforcement only, a minimum beam depth will be computed using the maximum reinforcement permitted for tension-controlled flexural members, $\rho_t$.

$d_{cover} = \text{dist. from bottom of beam up to center of bottom bar} = C_c + 1/2(\text{bar diameter}) = 2.5 \text{ in} = 63.5 \text{ mm}$

Determine the maximum tension-controlled reinforcement ratio fro material strengths from Table 6-1 of PCA Notes on ACI 318-11.

$$\rho_t = 0.01806$$

Compute $bd^2$ required:

$$M_u = 1.2 \cdot M_{DL} + 1.6 \cdot M_{LL} = 123 \text{ ft-kips}$$

$$R_n = \rho_t f_y \left( 1 - 0.5 \rho_t \frac{f_y}{0.85 f'_c} \right) = 910.9 \text{ psi}$$

$$bd^2_{req'd} = \frac{M_u}{R_n} = 1,803 \text{ in}^3$$

Size members so that $bd^2_{(prov)} \geq bd^2_{(req'd)}$

- $b = 10 \text{ in (column width)}$
- $d = \sqrt{\frac{1.803}{10}} = 13.43 \text{ in}$

Total beam depth, $D > d + d_{cover} = 15.93 \text{ in}$; use a $D = 16 \text{ in}$; $d = 13.5 \text{ in}$.

$$\rho_{prov} = \frac{0.85 f'_c}{f_y} \left( 1 - \sqrt{1 - \frac{2R_n \cdot prov}{0.85 f'_c}} \right) = 0.018$$

$$A_s = \rho_{prov} \cdot b \cdot d_{prov} = 2.406 \text{ in}^2$$

**Verify the design.**

$$T = A_s f_y = 2.406 \times 60 = 144.36 \text{ kips}$$

Design moment strength, $\phi M_n = D_m$

Strength reduction factor, $\phi = 0.9$

$$D_m = \phi \left[ A_s f_y \left( d_{prov} \cdot \frac{a}{2} \right) \right] = 123.2 \text{ ft kip}$$

$D_m > M_u$, hence design OK.

Compute minimum reinforcement
Since $A_s > A_{s,min}$, the design satisfies the minimum reinforcement criteria.

Compute the reinforcement provided

Use 2-#10 bars: $A_s = 2.53 \text{ in}^2$

Check Bar Spacing

End bar diameter, $\phi = 1.27 \text{ in}$, two bars in a layer

$f_s = \frac{2}{3} f_y = 40(10)^3 \text{ psi}$

Maximum spacing allowed:

$$s_{max} = \min \left( \frac{15 \left( \frac{40,000}{f_s} \right) - 2.5C_c}{12 \left( \frac{40,000}{f_s} \right)} \right) = 10 \text{ in}$$

Spacing provided:

$$s_{prov} = \frac{b \cdot (2C_c + 2 \times 0.5 \phi)}{N - 1} = 4.73 \text{ in}$$

V. ACI 318-08 Rectangular Singly Reinforced Beam

Flexural and shear reinforcement design of a singly reinforced concrete beam per the ACI 318-2008 code.

Details

A 10' simply supported beam is subjected to an ultimate uniform load of 9.736 k/ft.
\( f'_c = 4,000 \text{ psi} \)
\( f_y = 60,000 \text{ psi} \)
\( f'_{yt} = 60,000 \text{ psi} \)
\( \text{cover} = 2.5 \text{ in} \)
\( D = 16 \text{ in} \)
\( b_w = 10 \text{ in} \)

**Validation**

\[ A_g = D \times b_w = 16 \times 10 = 160 \text{ in}^2 \]
\[ d = D - \text{cover} = 16 - 2.5 = 13.5 \text{ in} \]

**Bending Reinforcement \( \phi = 0.9 \)**

Minimum reinforcement of flexural members [CI 10.5]

\[
A_{s,\text{min}} = \begin{cases} 
\frac{200}{f_y} b_w d = 0.45 \text{ in}^2 \\
\sqrt{\frac{f'_c}{f_y}} b_w d = 0.427 \text{ in}^2 
\end{cases} 
\]

\[
\beta_1 = 0.85 - 0.05 \left( \frac{f'_c - 4,000}{1,000} \right) = 0.85 
\]

\[
C_{\text{max}} = \frac{0.003 + 0.005 d}{0.003} = 5.063 \text{ in} 
\]

\[
\alpha_{\text{max}} = \beta_1 C_{\text{max}} = 4.303 \text{ in} 
\]

The ultimate moment:

\[
M_u = \frac{w_u l^2}{8} = \frac{9.736(12)^2}{8} = 121.7 \text{ ft} \cdot \text{k} 
\]

The depth of the compression block is:

\[
\alpha = d - \sqrt{d^2 - 2 \frac{M_u}{0.85 f'_{yt} b_w}} = 4.183 \text{ in} 
\]

Hence, \( \alpha < \alpha_{\text{max}} \).

The area of the tensile steel reinforcement required is:

\[
A_{s,\text{req}} = \frac{M_u}{\phi f_y (d - \alpha/2)} = 2.371 \text{ in}^2 
\]

Use 2-\#10 bars: \( A_s = 2.53 \text{ in}^2 \)

**Shear Reinforcement \( \phi = 0.75 \)**

Limit of concrete strength: \( \sqrt{f'_c} = 63.2 < 100 \), hence OK. [CI 11.1.2]

\[
\rho_w = \frac{A_s}{b_w d} = 0.018 
\]
\[ \lambda = 1 \]

Shear and moment at a distance, \( d \), from the support:

\[ V_{u1} = w \left( \frac{l}{2} - d \right) = 9.736 \left( \frac{10}{2} - 1.125 \right) = 37.73 \text{ kip} \]

\[ M_{u1} = \frac{wd}{2} (l - d) = \frac{9.736 \times 1.125}{2} (10 - 1.125) = 48.6 \text{ ft-k} = 583.2 \text{ in-k} \]

Per Cl 11.2.2.1 equation 11.5, the unfactored shear capacity of concrete is:

\[ V_c = \left( 1.9 \lambda f'_c + 2,500 \rho_w V_{u1} \frac{d}{M_{u1}} \right) b_w d = 21.48 \text{ kip} \]

\[ \phi V_c = 0.75 \times 21.48 = 16.11 \text{ kip} \]

The maximum shear capacity of the reinforcement is:

\[ \phi V_s = 8 \sqrt{f'_c b_w d} = 0.75 \times 68.31 = 51.23 \text{ kip} \]  

[Cl 11.4.7.9]

The minimum shear reinforcement, \( A_{vs} \), for any load combination is:

\[ A_{vs,\text{min}} = \max \left( \frac{b_w}{f_y} = 0.008 \text{ in}^2/\text{in} \right) \]

\[ A_{vs,\text{req'd}} = \frac{V_{u1} - \phi V_c}{\phi f_y d} = 0.036 \text{ in}^2/\text{in} \]  

[Cl 11.4.6.3 and R11.4.7]

Use 2-legged #4 stirrups (\( A_v = 0.39 \text{ in}^2 \) per stirrup).

\( s_{\text{max}} = d/2 = 13.5 / 2 = 6.75 \text{ in} \)

Use maximum spacing of 6.75 in: \( A_\text{vs} / s = 0.39 / 6 = 0.058 \text{ in}^2/\text{in} \)

\[ V_s = \frac{V_{u1} - \phi V_c}{\phi} = 28.83 \text{ kip} \]

Beam No. 1 Design Results - Torsion

Torsion is not required for this beam.
V. ACI 318-05 Rectangular Singly Reinforced Beam

Design of a singly reinforced concrete beam per the ACI 318-2005 code.

References
1. ACI 318-05
2. PCA Notes 2005: Example 7.1

Details

Determine the Required Area of Tension Reinforcement for given Concrete and Steel Properties with Given Factored Moment.

Select a rectangular beam size and required reinforcement to carry service load moments $M_{DL} = 56 \text{ ft-kips}$ and $M_{LL} = 35 \text{ ft-kips}$. Select reinforcement to control flexural cracking.

A 10' simply supported beam is subjected to an ultimate uniform load of 9.736 k/ft.

- $f'_c = 4,000 \text{ psi}$
- $f_y = 60,000 \text{ psi}$
- cover = 2 in

Validation

This is a complete design procedure for rectangular sections with tension reinforcement only, a minimum beam depth will be computed using the maximum reinforcement permitted for tension-controlled flexural members, $\rho_t$.

$\delta_{cover} = \text{dist. from bottom of beam up to center of bottom bar} = C_c + 1/2(\text{bar diameter}) = 2.5 \text{ in} = 63.5 \text{ mm}$

Determine the maximum tension-controlled reinforcement ratio for material strengths from Table 6-1 of PCA Notes on ACI 318-05.

$\rho_t = 0.01806$
Compute \( b d^2 \) required:

\[
M_u = 1.2 M_{DL} + 1.6 M_{LL} = 123 \text{ ft-kips}
\]

\[
R_n = \rho_i f_y \left( 1 - 0.5 \rho_i \frac{f_y}{0.85 f_y} \right) = 910.9 \text{ psi}
\]

\[
bd^2 \text{ req'd} = \frac{M_u}{\phi R_n} = 1,803 \text{ in}^3
\]

Size members so that \( bd^2 \text{(prov)} \geq bd^2 \text{(req'd)} \):

\[
b = 10 \text{ in (column width)}
\]

\[
d = \sqrt{\frac{1,803}{10}} = 13.43 \text{ in}
\]

Total beam depth, \( D > d + d_{cover} = 15.93 \text{ in} \); use a \( D = 16 \text{ in} \); \( d = 13.5 \text{ in} \).

\[
\rho_{prov} = \frac{0.85 f_y}{f_y} \left( 1 - \sqrt{\frac{2R_n}{0.85 f_y}} \right) = 0.018
\]

\[
A_s = \rho_{prov} \cdot b \cdot d_{prov} = 2.406 \text{ in}^2
\]

Verify the design.

\[
T = A_s f_y = 2.406 \times 60 = 144.36 \text{ kips}
\]

Design moment strength, \( \phi M_n = D_m \)

Strength reduction factor, \( \phi = 0.9 \)

\[
D_m = \phi \left[ A_s f_y \left( d_{prov} - \frac{a}{2} \right) \right] = 123.2 \text{ ft-kip}
\]

\( D_m > M_u \), hence design OK.

Compute minimum reinforcement

\[
A_{s,\text{min}} = \begin{cases} 
\frac{200}{f_y} bd = 0.45 \text{ in}^2 \\
\frac{3}{f_y} \left( \frac{c}{f_y} bd \right) = 0.427 \text{ in}^2
\end{cases}
\]

Since \( A_s > A_{s,\text{min}} \), the design satisfies the minimum reinforcement criteria.

Compute the reinforcement provided

Use 2-#10 bars: \( A_s = 2.53 \text{ in}^2 \)

Check Bar Spacing

End bar diameter, \( f_s = 1.27 \text{ in} \), two bars in a layer

\[
f_s = \frac{2}{3} f_y = 40(10)^3 \text{ psi}
\]

Maximum spacing allowed:
\[ s_{\text{max}} = \min \left( 15 \left( \frac{40,000}{f_y} \right) \cdot 2.5C_c, \frac{12 \left( 40,000 \right)}{f_y} \right) = 10 \text{ in} \]

Spacing provided:

\[ s_{\text{prov}} = \frac{b \cdot (2C_c + 2 \times 0.5 \phi)}{N - 1} = 4.73 \text{ in} \]

STAAD.Pro reports that it is unable to find a suitable bar arrangement to satisfy the reinforcement requirement per ACI 318-99. However, this does not mean that it is impossible to come up with a bar arrangement. When STAAD looks for a bar arrangement, it uses only bars of the same size. It begins with the bar size corresponding to the parameter MINMAIN. If an arrangement is not possible with that bar, it tries with the next larger bar size. If all the permissible bar sizes are exhausted, the program reports that it could not come up with a bar arrangement. However, the user may be able to satisfy the requirement by mixing bars of various diameters. For example, 3 # 11 bars and 2 # 10 bars may satisfy the requirement. The program is not equipped with facilities to come up with such combinations of bar sizes.

In fact, in the reference mentioned for the 1999 edition of ACI 318, the bar arrangement chosen is 2 # 9 and 1 # 8. It proves the point that finding bars of the same diameter is not possible for the 1999 edition based solution.

</tbody>
</table>

Note: In the reference book, the axial capacity provided is 141 kips, which is less than the requirement of 144 kips. In the STAAD implementation of the code, any reinforcement arrangement which yields less capacity than the required value is considered un-acceptable. This is why STAAD reports a higher required steel than the reference book.

</tr>
</tbody>
</table>

**Note:** STAAD reports a more economical bar arrangement than the reference book.

**STAAD Input**

The file C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\10 Concrete Design\US\ACI 318-99 Circular Column.STD is typically installed with the program.

**STAAD SPACE CIRCULAR CONCRETE COLUMN DESIGN PER ACI 318-99**

**START JOB INFORMATION**
V. ACI 318-99 Beam and Column Reinforcement

Determine the area of reinforcing steel required for a beam and column in a moment frame.
Reference

Related Links
- D1.F.4.6 Beam Design per ACI 318-11 and Earlier (on page 1217)

Problem
A plane frame is created with such loading as to create 138 Kip-Ft moment on beam and 574 Kip of axial load coupled with above moment on column.

Size of the beam is 10” x 16” and size of the column 14” x 16”.

\[
P = 521.32 \text{ kip} \\
w = 5.268 \text{ kip/ft} \\
L = 20 \text{ ft}, H = 15 \text{ ft}
\]

\[\text{Figure 506: Concrete moment frame}\]

### V. EC5 - Timber Column

A Timber Column of length 1.0 meter, having c/s dimension of 73 mm × 198 mm, is subjected to an axial compressive force of 50.0 kN. Design the member for the ultimate limit state.

#### Details

**Material properties:**

- Timber class: C24
- Service classes: Class 2, moisture content ≤ 20%
- Load duration classes: Medium-term

**Cross section properties:**

- Length of the member is 1 m.
Rectangular cross section, \( b = 73 \text{ mm}, \ h = 198 \text{ mm}, \)
Effective cross sectional area \( A = 14,454 \text{ mm}^2, \)
Radius of gyration of cross section about y-axis \( r_y = 21 \text{ mm}, \)
Radius of gyration of cross section about z-axis \( r_z = 57 \text{ mm}, \)
Section modulus of cross section about z-axis: \( W_z = 4.770 \times 10^5 \text{ mm}^3 \)
Section modulus of cross section about y-axis: \( W_y = 1.759 \times 10^5 \text{ mm}^3 \)

**Validation**

Characteristic material properties for timber:

Modification factor \( K_{mod} = 0.80 \) ...from table 3.1

Material factors \( \gamma_m = 1.30 \) ... from table 2.3

\[ f_{c0k} = 21.00 \text{ N/mm}^2 \]
\[ F_{c0d} = (K_{mod} f_{c0k})/\gamma_m = (0.80 \cdot 21.00)/1.30 = 12.92 \text{ N/mm}^2 \] [Cl 2.4.1(1)P]

Cross section loads:

\( F_x = 50.000 \text{ kN} \)

Compression parallel to the grain:

\[ S_{c0d} = (1000x F_x)/A = (1000x50.000)/14454 = 3.46\text{N/mm}^2 < 12.92\text{N/mm}^2 \ (F_{c0d}) \]

The ratio of actual compressive stress to allowable compressive strength:

\[ S_{c0d}/F_{c0d} = 3.46 / 12.92 = 0.268 < 1.0 \] [Cl. 6.1.4.(1)P]

Check for Slenderness:

Slenderness ratios:

\[ \lambda_z = (1000/57) = 17.54 \]
\[ \lambda_y = (1000/21) = 47.62 \]
\[ E_{0,\text{mean}} = 1.1031 \text{ kN/m}^2 \]

As timber grade is C24 (i.e., Soft Wood)

\[ E_{0,05} = 0.67 \cdot E_{0,\text{mean}} = 0.739 \text{ kN/m}^2 \]

[Annex A,EN 338:2003]

\[ \lambda_{rel,z} = \lambda_z/\pi (f_{c0k}/E_{0,05})^{1/2} = 17.54/\pi(21.00/0.739)^{1/2} = 0.298 \]
\[ \lambda_{rel,y} = \lambda_y/\pi (f_{c0k}/E_{0,05})^{1/2} = 47.62/\pi(21.00/0.739)^{1/2} = 0.809 \]

Since, \( \lambda_{rel,y} \) is greater than 0.3, following conditions should be satisfied:

\[ S_{c0d}/(K_{cz} F_{c0d}) + (S_{mzd}/F_{mzd}) + K_m (S_{myd}/F_{myd}) \leq \text{RATIO} \]
\[ S_{c0d}/(K_{cy} F_{c0d}) + (S_{mzd}/F_{mzd}) + (S_{myd}/F_{myd}) \leq \text{RATIO} \]

Where:

\[ K_z = 0.5 \{ 1 + \beta_c (\lambda_{rel,z} \cdot 0.3) + (\lambda_{rel,z})^2 \} = 0.50 \{ 1 + 0.2(0.298 \cdot 0.3) + (0.298)^2 \} = 0.541 \]
\[ K_y = 0.5 \{ 1 + \beta_c (\lambda_{rel,y} \cdot 0.3) + (\lambda_{rel,y})^2 \} = 0.50 \{ 1 + 0.2(0.809 \cdot 0.3) + (0.809)^2 \} = 0.878 \]
\[ K_{cz} = 1/(K_z) + [(K_z)^2 \cdot (\lambda_{rel,z})^2]^{1/2} = 1/(0.541) + [(0.541)^2 \cdot (0.298)^2]^{1/2} = 1.008 \]
\[ K_{cy} = \frac{1}{(K_y + [(K_{zy})^2 - (\lambda_{rel,y})^2]^{1/2})} = \frac{1}{(0.878 + [(0.878)^2 - (0.809)^2]^{1/2})} = 0.820 \]

For Rectangular cross section \( K_m = 0.70 \). The member is subjected to Compression only, so actual bending stress is zero.

\[ S_{c0d}/(K_{cz} \cdot F_{c0d}) + (S_{mzd}/F_{mzd}) + K_m \cdot (S_{myd}/F_{myd}) = \frac{3.46}{(1.008 \cdot 12.92)} + 0.0 + 0.0 = 0.268 \]

\[ S_{c0d}/(K_{cy} \cdot F_{c0d}) + K_m \cdot (S_{mzd}/F_{mzd}) + (S_{myd}/F_{myd}) = \frac{3.46}{(0.820 \cdot 12.92)} + 0.0 + 0.0 = 0.326 \]

Hence the critical ratio is 0.326 < 1.0 and the section is safe.

V. EC5 - Timber Column with Bending

A timber column of length 1.0 meter, having c/s dimension of 73 mm × 198 mm, is subjected to an axial compressive force of 5.0 kN and moments of 2.0 kN·m and 1.0 kN·m about its major and minor axes respectively. Design the member for the ultimate limit state.

Details

Material properties:

- Timber Strength Class: C24
- Service classes: Class 2, moisture content <=20%
- Load duration: Medium-term

Cross section properties:

- Length of the member is 1 m.
- Rectangular cross section, b = 73 mm, h = 198 mm,
- Effective cross sectional area $A = 14454 \text{ mm}^2$,
- Radius of gyration of cross section about $y$-axis $r_y = 21 \text{ mm}$,
- Radius of gyration of cross section about $z$-axis $r_z = 57 \text{ mm}$,
- Section modulus of cross section about $z$-axis: $W_z = 4.770 \times 10^5 \text{ mm}^3$
- Section modulus of cross section about $y$-axis: $W_y = 1.759 \times 10^5 \text{ mm}^3$
Validation

Characteristic material properties for timber:

Modification factor $K_{mod} = 0.80$ ... from table 3.1

Material factors $\gamma_m = 1.30$ ... from table 2.3

- $f_{c0k} = 21.00 \text{ N/mm}^2$
- $E_{0.05} = 7370 \text{ N/mm}^2$
- $P_{c0d} = K_{mod} f_{c0k}/\gamma_m = (0.80 \times 21.00)/1.30 = 12.92 \text{ N/mm}^2$ [Cl 2.4.1(1)P]
- $f_{myk} = 24.00 \text{ N/mm}^2$
- $F_{c0d} = K_{mod} f_{c0k}/\gamma_m = (0.80 \times 21.00)/1.30 = 14.77 \text{ N/mm}^2$
- $f_{mzk} = 24.00 \text{ N/mm}^2$
- $F_{mzd} = K_{mod} f_{mzk}/\gamma_m = (0.80 \times 24.00)/1.30 = 14.77 \text{ N/mm}^2$

Cross section loads:

- $F_x = 5.000 \text{ kN}$
- $M_z = 2.000 \text{ kN} \cdot \text{m}$
- $M_y = 1.000 \text{ kN} \cdot \text{m}$

Check for Slenderness:

Slenderness ratios:

- $\lambda_z = (1000/57) = 17.54$
- $\lambda_y = (1000/21) = 47.62$
- $\lambda_{rel,z} = \lambda_z / \pi (f_{c0k}/E_{0.05})^{1/2} = 17.54 / \pi (21.00/7370)^{1/2} = 0.298$
- $\lambda_{rel,y} = \lambda_y / \pi (f_{c0k}/E_{0.05})^{1/2} = 47.62 / \pi (21.00/7370)^{1/2} = 0.809$

Since, $\lambda_{rel,y}$ is greater than 0.3, following conditions should be satisfied [Cl 6.3.2.3]:

$$S_{c0d}/(K_{cz} P_{c0d}) + (S_{mzd}/F_{mzd}) + K_m (S_{myd}/F_{myd}) \leq \text{RATIO}$$

Where:

- $K_{cz} = 1/(K_z + [(K_z)^2 - (\lambda_{rel,z})^2]^{1/2}) = 1/(0.541 + [(0.541)^2 - (0.298)^2]^{1/2}) = 1.008$
- $K_{cy} = 1/(K_y + [(K_y)^2 - (\lambda_{rel,y})^2]^{1/2}) = 1/(0.878 + [(0.878)^2 - (0.809)^2]^{1/2}) = 0.820$

For Rectangular cross section $K_m = 0.70$.

- $S_{c0d} = (1000 \cdot F_x/A) = (1000 \times 5.000)/14454 = 0.35 \text{ N/mm}^2$
- $S_{mzd} = (10^6 \cdot M_z)/W_z = (10^6 \times 2.000)/(4.770 \times 10^5) = 4.19 \text{ N/mm}^2$
- $S_{myd} = (10^6 \cdot M_y)/W_y = (10^6 \times 1.000)/(1.759 \times 10^5) = 5.69 \text{ N/mm}^2$

Combined stress ratio:
\[
\begin{align*}
S_{cd}(K_{cd} F_{cd}) + (S_{mzd}/F_{mzd}) + Km (S_{myd}/F_{myd}) &= 0.35/(1.008 \cdot 12.92) + 4.19/14.77 \\
&+ 0.70(5.69/14.77) = 0.027 + 0.283 + 0.266 = 0.266
\end{align*}
\]
\[
\begin{align*}
S_{cd}(K_{cy} F_{cd}) + Km (S_{mzd}/F_{mzd}) + (S_{myd}/F_{myd}) &= 0.35/(0.820 \cdot 12.92) + 0.70(4.19/14.77) \\
&+ 5.69/14.77 = 0.033 + 0.385 + 0.198 = 0.616
\end{align*}
\]

Hence the critical ratio is 0.616 < 1.0 and the section is safe.

Application Examples

This section contains various examples of analytical models, physical models, macro script files, and more which can be helpful in familiarizing yourself with aspects of STAAD.Pro features.

This UK and US sections include examples of various problems that can be solved using the STAAD engine. These examples represent various structural analyses and design problems commonly encountered by structural engineers.

The example models included here along with many other files are installed with the program by default. The default location for these files is
C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\.

**Note:** The option to include these files is selected during the product installation.

EX. Building Planner Example Models

The following models are included when STAAD.Pro is installed.

These files are located in the
C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models \Building Planner\ folder (default location).

**Table 887: Building Planner examples installed with the program**

<table>
<thead>
<tr>
<th>File name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Circular Building.std</td>
<td>This model demonstrates how circular shaped non-orthogonal building can be created accurately in the Building Planner workflow. This is a complex model and with the use of plan in dxf format received from architect (included in this folder), the entire plan is created. With the use of tools like Copy, Paste, and Mirror, the symmetrical circular structure can be created by just using one half of the model created in dxf. Columns with different beta angle can be modeled effectively and accurately using the Building Planner.</td>
</tr>
<tr>
<td>Typical Ground +3 Story Building.std</td>
<td>This model is of a typical 4 story building having 3 different plans: Plinth Plan, Typical Plan, and Roof Plan. The Plinth plan consist of beam and column without slabs. The Roof Plan has wall loads only for parapet walls.</td>
</tr>
</tbody>
</table>
**Application Examples**

**EX. Chinese Design Examples**

The following models are included when STAAD.Pro is installed.

These files are located in the `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\China\` folder (default location).

### Application Examples

#### EX.Tutorials

The following models are included when STAAD.Pro is installed.

These files are located in the C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\Tutorials\folder (default location).

**Table 893: Tutorial files installed with the program**

<table>
<thead>
<tr>
<th>File name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tutorial 1 - Steel Portal Frame.std</td>
<td>A three-member portal frame which utilized steel design to select members.</td>
</tr>
<tr>
<td>Tutorial 2 - RC Frames Structure.std</td>
<td>A 3D concrete frame that uses concrete design to select reinforcement.</td>
</tr>
</tbody>
</table>

---

**Note:** The file name of the STAAD input file is listed. Other files associated with this model are included with the same base file name in this folder using different file extensions.
Tutorial 3 - Analysis of a Slab.std

A finite element mesh analysis of a concrete slab supported on two edges.

- **T.2 - RC Framed Structure** (on page 458)
- **T.3 - Analysis of a slab** (on page 544)

EX. American Design Examples

EX. US-1 Plane Frame with Steel Design

After one analysis, member selection is requested. Since member sizes change during the member selection, another analysis is done followed by final code checking to verify that the final sizes meet the requirements of the code based on the latest analysis results.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US\US-1 Plane Frame with Steel Design.STD when you install the program.
where:

L = 15 ft, H1 = 20 ft, H2 = 15 ft, and H3 = 9 ft
WLx = 0.6 k/ft, WLy = 1.0 k/ft, RL = 0.9 k/ft, LL = 1.2 k/ft, P1 = 35 kips, P2 = 15 kips
Members 1, 3, & 4 are a W14x90, Members 5, 6, & 7 are a W21x50, Member 2 is a W10x49, Members 8 through 13 are a W18x35. All other members comprising the truss are a L4x4x1/4

Actual input is shown in bold lettering followed by explanation.

### STAAD PLANE EXAMPLE PROBLEM NO. 1

Every input has to start with the term STAAD. The term PLANE signifies that the structure is a plane frame structure and the geometry is defined through X and Y axes.
Defines the input units for the data that follows.

**JOINT COORDINATES**

1  0.  0. ;  2  30  0 ;  3  0  20  0  6  30  20  0
7  0  35 ;  8  30  35 ;  9  7.5  35 ;  10  22.5  35.
11  15  35 ;  12  5.  38. ;  13  25  38
14  10  41 ;  15  20  41 ;  16  15  44

Joint number followed by X and Y coordinates are provided above. Since this is a plane structure, the Z coordinates need not be provided.

**Note:** Semicolons (;) are used as line separators to allow for input of multiple sets of data on one line.

**MEMBER INCIDENCE**

1  1  3 ;  2  3  7 ;  3  2  6 ;  4  6  8 ;  5  3  4
6  4  5 ;  7  5  6 ;  8  7  12 ;  9  12 14
10  14 16 ;  11  15 16 ;  12  13 15 ;  13  8 13
14  9  12 ;  15  9 14 ;  16  11 14 ;  17  11 15
18  10 15 ;  19  10 13 ;  20  7  9
21  9  11 ;  22  10 11 ;  23  8 10

Defines the members by the joints to which they are connected.

**MEMBER PROPERTY AMERICAN**

1  3  4 TABLE ST W14X90 ;  2 TA ST W10X49
5  6  7 TA ST W21X50 ;  8 TO 13 TA ST W18X35
14 TO 23 TA ST L40404

Member properties are from the British steel table. The term ST stands for standard single section.

**MEMB TRUSS**

14 TO 23

The above command defines that members 14 through 23 are of type truss. This means that these members can carry only axial tension/compression and no moments.

**MEMB RELEASE**

5 START MZ

Member 5 has local moment-z (MZ) released at the start joint. This means that the member cannot carry any moment-z (i.e., strong axis moment) at node 3.

**UNIT INCH**

DEFINE MATERIAL START
ISOTROPIC STEEL
E 290000
POISSON 0.3
DENSITY 0.000283
ALPHA 6e-006
DAMP 0.03
TYPE STEEL
STRENGTH FY 36 FU 58 RY 1.5 RT 1.2
END DEFINE MATERIAL

The **DEFINE MATERIAL START** initiates input for a material definition, which can later be assigned to all members. STAAD.Pro has several built-in material definitions, including the **ISOTROPIC STEEL** material used here. The length unit is changed from FEET to INCH to facilitate the input in familiar units.
The CONSTANT command initiates input for material constants or material definition references. The BETA command specifies that members 3 and 4 are rotated by 90 degrees around their own longitudinal axis. See G. 4.3 Relationship Between Global and Local Coordinates (on page 2069) for the definition of the beta angle.

<table>
<thead>
<tr>
<th>SUPPORT</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Fixed ; 2 Pinned</td>
</tr>
</tbody>
</table>

A fixed support is located at joint 1 and a pinned support at joint 2.

| PRINT MEMBER INFORMATION LIST 1 5 14 |
| PRINT MEMBER PROPERTY LIST 1 2 5 8 14 |

The above PRINT commands are self-explanatory. The LIST option restricts the print output to the members listed.

| LOADING 1 DEAD AND LIVE LOAD |

Load case 1 is initiated followed by a title.

| SELFWEIGHT Y -1.0 |

One of the components of load case 1 is the selfweight of the structure acting in the global Y direction with a factor of -1.0. Since global Y is vertically upward, the factor of -1.0 indicates that this load will act downwards.

| JOINT LOAD |
| 4 5 FY -15. ; 11 FY -35. |

Load 1 contains joint loads also. FY indicates that the load is a force in the global Y direction.

| MEMB LOAD |
| 8 TO 13 UNI Y -0.9 ; 6 UNI GY -1.2 |

Load 1 contains member loads also. GY indicates that the load is in the global Y direction while Y indicates local Y direction. The term UNI stands for uniformly distributed load. Loads are applied on members 6, and 8 to 13.

| CALCULATE RAYLEIGH FREQUENCY |

The above command at the end of load case 1, is an instruction to perform a natural frequency calculation based on the Rayleigh method using the data in the above load case.

| LOADING 2 WIND FROM LEFT |
| MEMBER LOAD |
| 1 2 UNI GX 0.6 ; 8 TO 10 UNI Y -1. |

Load case 2 is initiated and contains several member loads.

| * 1/3 RD INCREASE IS ACCOMPLISHED BY 75% LOAD |
| LOAD COMB 3 75 PERCENT DL LL WL |
| 1 0.75 2 0.75 |

The above command identifies a combination load (case no. 3) with a title. The second line provides the load cases and their respective factors used for the load combination.

**Note:** Any line beginning with an asterisk (*) character is treated as a comment line.

| PERFORM ANALYSIS |

This command instructs the program to proceed with the analysis.

| LOAD LIST 1 3 |
The above command activates load cases 1 and 3 only for the commands to follow. This also means that load case 2 will be made inactive.

```
PRINT MEMBER FORCES
PRINT SUPPORT REACTION
```

The above PRINT commands are self-explanatory. Also note that all the forces and reactions will be printed for load cases 1 and 3 only.

```
PARAMETER
CODE AISC UNIFIED
NSF 0.85 ALL
BEAM 1.0 ALL
KY 1.2 MEMB 3 4
RATIO 0.9 ALL
PROFILE W14 MEMB 1 3 4
```

The PARAMETER command is used to specify steel design parameters such as net section factor (NSF), effective length factor for bending about the minor axis (KY), etc. Information on these parameters can be obtained from the manual where the implementation of the code is explained. The BEAM parameter is specified to perform design at every 1/12th point along the member length, which is also the default. The RATIO parameter specifies that the ratio of actual loading over section capacity should not exceed 0.9.

```
SELECT ALL
```

The above command instructs the program to select the most economic section for all the members based on the results of the analysis.

```
GROUP MEMB 1 3 4
GROUP MEMB 5 6 7
GROUP MEMB 8 TO 13
GROUP MEMB 14 TO 23
```

Although the program selects the most economical section for all members, it is not always practical to use many different sizes in one structure. Grouping is a procedure by which the cross section which has the largest value for the specified attribute, which in this case is the default and hence the AREA, from among the associated member list, is assigned to all members in the list. Hence, the cross sections for members 1, 3 and 4 are replaced with the one with the largest area from among the three.

```
PERFORM ANALYSIS
```

As a result of the selection and grouping, the member sizes are no longer the same as the ones used in the original analysis. Hence, it is necessary to reanalyze the structure using the new properties to get new values of forces in the members.

```
PARAMETER
BEAM 1.0 ALL
RATIO 1.0 ALL
TRACK 1.0 ALL
```

A new set of values are now provided for the above parameters. The actual load to member capacity RATIO has been redefined as 1.0. The TRACK parameter tells the program to print out the design results to the intermediate level of descriptively.

```
CHECK CODE ALL
```

With the above command, the latest member sizes with the latest analysis results are checked to verify that they satisfy the CODE specifications.

```
STEEL TAKE OFF
```
Application Examples

EX. American Design Examples

This command instructs the program to list the length and weight of all the different member sizes.

FINISH

This command terminates the STAAD run.

### All Units Are - KIP - FEET (UNLESS OTHERWISE Noted).

**NOTE :** AISC 360-16 Design Statement for STAAD.Pro.

*** AXIS CONVENTION ***:

The capacity results and intermediate results in the report follow the notations and axes labels as defined in the AISC 360-16 code.

The analysis results are reported in STAAD.Pro axis convention and the AISC 360:16 design results are reported in AISC 360-16 code axis convention.

</tbody>
</table>

*** DESIGN MESSAGES ***:

1. Section classification reported is for the cross section and loadcase that produced the worst case design ratio for flexure/compression Capacity results.
2. Results for any Capacity/Check that is not relevant for a section/loadcase based on the code clause in AISC 360-16 will not be shown in the report.
3. Bending results are reported as being about the relevant axis (X/Y), while the results for shear are reported as being for shear forces along the axis. E.g : Mx indicates bending about the X axis, while Vx indicates shear along the X axis.

*** ABBREVIATIONS ***:

- F-T-B = Flexural-Torsional Buckling
- L-T-B = Lateral-Torsional Buckling
- F-L-B = Flange Local Buckling
- W-L-B = Web Local Buckling
- L-L-B = Leg Local Buckling
- C-F-Y = Compression Flange Yielding
- T-F-Y = Tension Flange Yielding

75. BEAM 1.0 ALL
76. RATIO 1.0 ALL
77. TRACK 1.0 ALL
78. CHECK CODE ALL

PARAMETER 2
EXAMPLE PROBLEM NO. 1
STAAD.PRO CODE CHECKING - AISC 360-16 LRFD (V1.2)

ALL UNITS ARE - KIP FEET (UNLESS OTHERWISE Noted).
***NOTE : AISC 360-16 Design Statement for STAAD.Pro.***

**** AXIS CONVENTION ****:

The capacity results and intermediate results in the report follow the notations
and axes labels as defined in the AISC 360-16 code.
The analysis results are reported in STAAD.Pro axis convention and the AISC 360:16
design results are reported in AISC 360-16 code axis convention.

<table>
<thead>
<tr>

</tr>
<tr>
<td>Mx</td>
<td>MZ</td>
<td>Bending moment about major axis.</td>
</tr>
</tbody>
</table>

### *** DESIGN MESSAGES ***:

1. Section classification reported is for the cross section and loadcase that produced the worst case design ratio for flexure/compression Capacity results.
2. Results for any Capacity/Check that is not relevant for a section/loadcase based on the code clause in AISC 360-16 will not be shown in the report.
3. Bending results are reported as being \ about \ the relevant axis (X/Y), while the results for shear are reported as being \ along \ the axis.

E.g : Mx indicates bending about the X axis, while Vx indicates shear along the X axis.

*** ABBREVIATIONS ***:

F-T-B = Flexural-Torsional Buckling
L-T-B = Lateral-Torsional Buckling
F-L-B = Flange Local Buckling
W-L-B = Web Local Buckling
L-L-B = Leg Local Buckling
C-F-Y = Compression Flange Yielding
T-F-Y = Tension Flange Yielding

**EX. US-2 Area Load Generation on Floor Structure**

A floor structure (bound by global X-Z axis) made up of steel beams is subjected to area load (i.e., load/area of floor). Load generation based on one-way distribution is illustrated in this example.

In the case of loads such as joint loads and member loads, the magnitude and direction of the load at the applicable joints and members is directly known from the input. However, the area load is a different sort of load where a load intensity on the given area has to be converted to joint and member loads. The calculations required to perform this conversion are done only during the analysis. Consequently, the loads generated from the `AREA LOAD` command can be viewed only after the analysis is completed.

This problem is installed with the program by default to

C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US\US-2 Area Load Generation on Floor Structure.STD when you install the program.
Where:

\[ W_1 = 5 \text{ ft}, \quad W_2 = 3.5 \text{ ft}, \quad W_3 = 5.5 \text{ ft}, \quad L_1 = 7 \text{ ft}, \quad L_2 = 15 \text{ ft}, \quad L_3 = 10 \text{ ft} \]

Actual input is shown in bold lettering followed by explanation.

**STAAD FLOOR A FLOOR FRAME DESIGN WITH AREA LOAD**

Every input has to start with the term **STAAD**. The term **FLOOR** signifies that the structure is a floor structure and the structure is in the \( x - z \) plane.

**UNIT FT KIP**

Defines the input units for the data that follows.

<table>
<thead>
<tr>
<th>JOINT COORDINATES</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 0 0. 0. 5 20. 0. 0. ; 7 5. 0. 10.</td>
</tr>
<tr>
<td>8 10. 0. 10. ; 9 13. 0. 10. ; 10 15. 0. 10. ; 11 16.5 0. 10.</td>
</tr>
<tr>
<td>12 20. 0. 20. ; 13 0. 0. 25. ; 14 5. 0. 25. ; 15 11. 0. 25.</td>
</tr>
<tr>
<td>16 16.5 0. 25; 17 20. 0. 25; 18 0. 0. 28.</td>
</tr>
<tr>
<td>19 20. 0. 28.; 20 0. 0. 35.; 21 20. 0. 35.</td>
</tr>
</tbody>
</table>
Joint numbers followed by X, Y and Z coordinates are provided above. Since this is a floor structure, the Y coordinates are all the same (in this case, zero). Joints between 1 and 5 (i.e., 2, 3, 4) are generated in the first line of input, taking advantage of the equal spacing between the joints (refer to TR.11 Joint Coordinates Specification (on page 2193) for more information).

**Note:** Semicolons (;) are used as line separators to allow for input of multiple sets of data on one line.

<table>
<thead>
<tr>
<th>MEMBER INCIDENCES</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 1 2 4 ; 5 7 8 9 ; 10 13 14 13 ; 14 18 19</td>
</tr>
<tr>
<td>15 20 21 ; 16 18 20 ; 17 13 18 ; 18 1 13</td>
</tr>
<tr>
<td>19 7 14 ; 20 2 7 ; 21 9 15</td>
</tr>
<tr>
<td>22 3 8 ; 23 11 16 ; 24 4 10 ; 25 19 21</td>
</tr>
<tr>
<td>26 17 19 ; 27 12 17 ; 28 5 12</td>
</tr>
</tbody>
</table>

Defines the members by the joints to which they are connected.

<table>
<thead>
<tr>
<th>MEMB PROP AMERICAN</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 TO 28 TABLE ST W12X26</td>
</tr>
</tbody>
</table>

Member properties are specified from the AISC steel table. In this case, the W12X26 section is chosen. The term ST stands for standard single section.

<table>
<thead>
<tr>
<th>* MEMBERS WITH PINNED ENDS ARE RELEASED FOR MZ</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMB RELEASE</td>
</tr>
<tr>
<td>1 5 10 14 15 18 17 28 26 20 TO 24 START MZ</td>
</tr>
<tr>
<td>4 9 13 14 15 18 16 27 25 19 21 TO 24 END MZ</td>
</tr>
</tbody>
</table>

The first set of members (1 5 10 etc) have local moment-z (MZ) released at the start joint. This means that these members cannot carry any moment-z (i.e., strong axis moment) at the start joint. The second set of members have MZ released at the end joints.

**Note:** Any line beginning with an asterisk (*) character is treated as a comment line.

</table>

A fixed support has been specified at the above joints.

<table>
<thead>
<tr>
<th>LOADING</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 300 POUNDS PER SFT DL+LL</td>
</tr>
</tbody>
</table>
Load case 1 is initiated followed by a title.

FLOOR LOAD
YRANGE -0.5 0.5 FLOAD -0.30

All members within a range of -0.5 feet to 0.5 feet in the global Y direction (which is the entire floor of this model) are subjected to a floor load of 0.3 kips/sq.ft. The program converts area loads into individual member loads.

PERFORM ANALYSIS PRINT LOAD DATA

This command instructs the program to proceed with the analysis. The PRINT LOAD DATA command is specified to obtain a listing of the member loads which were generated from the FLOOR LOAD.

PARAMETERS
CODE AISC UNIFIED
BEAM 1 ALL
DMAX 2.0 ALL
DMIN 1.0 ALL
UNT 1.0 ALL
UNB 1.0 ALL

The PARAMETER command is used to specify steel design parameters (refer to D1.B.1.2 Design Parameters (on page 1126)). Design is to be performed per the specifications of the AISC ASD Code. The BEAM parameter is specified to perform design at every 1/12th point along the member length. DMAX and DMIN specify maximum and minimum depth limitations to be used during member selection. UNT and UNB are used to specify unsupported length for top and bottom flange to be used for calculation of allowable bending stress.

SELECT MEMB 2 6 11 14 15 16 18 19 21 23 24 27

The above command instructs the program to select the most economical section from the British steel table for the members listed.

FINISH

The FINISH command terminates the STAAD run.

PARAMETER 1

A FLOOR FRAME DESIGN WITH AREA LOAD

STAAD.Pro MEMBER SELECTION - AISC 360-16 LRFD (V1.2)
ALL UNITS ARE - KIP FEET (UNLESS OTHERWISE Noted).

***NOTE : AISC 360-16 Design Statement for STAAD.Pro.

*** AXIS CONVENTION ***:

The capacity results and intermediate results in the report follow the notations and axes labels as defined in the AISC 360-16 code.
The analysis results are reported in STAAD.Pro axis convention and the AISC 360:16 design results are reported in AISC 360-16 code axis convention.

AISC Spec.  STAAD.Pro  Description
------------  -----------  ---------------
X               Z          Axis typically parallel to the sections principal major axis.
Y               Y          Axis typically parallel to the sections principal minor axis.
Z               X          Longitudinal axis perpendicular to the cross section.

SECTION FORCES AXIS MAPPING:

AISC Spec.  STAAD.Pro  Description
------------  -----------  ---------------
Pz              FX         Axial force.
Vy              FY         Shear force along minor axis.
Vx              FZ         Shear force along major axis.
Tz              MX         Torsional moment.
My              MY         Bending moment about minor axis.
Mx              MZ         Bending moment about major axis.

*** DESIGN MESSAGES ***:

1. Section classification reported is for the cross section and loadcase that produced the worst case design ratio for flexure/compression Capacity results.
2. Results for any Capacity/Check that is not relevant for a section/loadcase based on the code clause in AISC 360-16 will not be shown in the report.
3. Bending results are reported as being about the relevant axis (X/Y), while the results for shear are reported as being for shear forces along the axis.
   E.g : Mx indicates bending about the X axis, while Vx indicates shear along the X axis.

*** ABBREVIATIONS ***:

F-T-B = Flexural-Torsional Buckling
L-T-B = Lateral-Torsional Buckling
F-L-B = Flange Local Buckling
W-L-B = Web Local Buckling
L-L-B = Leg Local Buckling
C-F-Y = Compression Flange Yielding
T-F-Y = Tension Flange Yielding

A FLOOR FRAME DESIGN WITH AREA LOAD    -- PAGE NO.   18
******************************************************************************
EX. US-3 Soil Springs for Portal Frame

A portal frame type steel structure is sitting on concrete footings. The soil is to be considered as an elastic foundation. The value of soil subgrade reaction is known from which spring constants are calculated by multiplying the subgrade reaction by the tributary area of each modeled spring.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US \US-3 Soil Springs for Portal Frame.STD when you install the program.

Where:

\[ B = 20 \text{ ft}, \ H = 10 \text{ ft}, \ F1 = 4 \text{ ft}, \ F2 = 8 \text{ ft} \]
\[ P = 5 \text{ kips}, \ w = 3 \text{ kips/ft} \]
\[ \text{Soil Subgrade Reaction} = 250 \text{ kips/ft}^3 \]
Table 894: Spring constant calculation

<table>
<thead>
<tr>
<th>Springs of Joints</th>
<th>Spring Constant</th>
</tr>
</thead>
<tbody>
<tr>
<td>1, 5, 10, &amp; 14 (Edges)</td>
<td>8 x 1 x 250 = 2,000 kips/ft</td>
</tr>
<tr>
<td>2, 3, 4, 11, 12, &amp; 13 (Interior)</td>
<td>8 x 2 x 250 = 4,000 kips/ft</td>
</tr>
</tbody>
</table>

Actual input is shown in bold lettering followed by explanation.

STAAD PLANE PORTAL ON FOOTING FOUNDATION

Every input has to start with the term STAAD. The term PLANE signifies that the structure is a plane frame structure and the geometry is defined through X and Y axes.

UNIT FT KIPS

Defines the input units for the data that follows.

JOINT COORDINATES

<table>
<thead>
<tr>
<th>Joint</th>

</table>

The first two lines define member properties as prismatic (PRIS) followed by depth (YD) and width (ZD) values. The program will calculate the properties necessary to perform the analysis. See G.6.1 Prismatic Properties (on page 2091) for additional information. Member properties for the remaining members are chosen from the British steel table. The term ST stands for standard single section.

* E FOR STEEL IS 29,000 AND FOR CONCRETE 3000
UNIT INCHES
DEFINE MATERIAL START
ISOTROPIC STEEL
E 29000
The CONSTANT command initiates input for material constants like modulus of elasticity, Density, and Poisson's ratio. The length unit is changed from FT to INCH to facilitate the input in familiar units.

**Note:** Any line beginning with an asterisk (*) character is treated as a comment line.

The supports for the structure are specified above. The first set of joints are supports restrained in all directions except global moment-z (MZ). Also, a spring having a spring constant of 4,000 kip/ft is provided in the global Y direction at these nodes. The second set is similar to the former except for a different value of the spring constant.

**LOADING 1 DEAD AND WIND LOAD COMBINED**

Load case 1 is initiated followed by a title.

**SELF Y -1.0**

The selfweight of the structure is specified as acting in the global Y direction with a -1.0 factor.

Since global Y is vertically upwards, the -1.0 factor indicates that this load will act downwards.

**JOINT LOAD**

6 7 FX 5.0

Load 1 contains joint loads also. FX indicates that the load is a force in the global X direction.

**MEMBER LOAD**

7 8 UNI GY -3.0

Load 1 contains member loads also. GY indicates that the load acts in the global Y direction. The term UNI stands for uniformly distributed load, and is applied on members 7 and 8, acting downwards.

**PERFORM ANALYSIS**

This command instructs the program to proceed with the analysis.

**PRINT ANALYSIS RESULTS**
Application Examples
EX. American Design Examples

The above PRINT command instructs the program to print analysis results which include joint displacements, member forces and support reactions.

FINISH

This command terminates the STAAD run.

EX. US-4 Inactive Members in a Braced Frame

This example is a typical case of a load-dependent structure where the structural condition changes for different load cases. In this example, different bracing members are made inactive for different load cases. This is done to prevent these members from carrying any compressive forces.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US\US-4 Inactive Members in a Braced Frame.STD when you install the program.

Where:

L1 = 180 in., L2 = 240 in.
P1 = 15 kips, P2 = 30 kips

Actual input is shown in bold lettering followed by explanation.

STAAD PLANE
* A PLANE FRAME STRUCTURE WITH TENSION BRACING
Every input has to start with the term STAAD. The term **PLANE** signifies that the structure is a plane frame structure and the geometry is defined through X and Y axes.

**UNIT INCH KIP**

Defines the input units for the data that follows.

**SET NL 3**

This structure has to be analyzed for three primary load cases. Consequently, the modeling of our problem requires us to define three sets of data, with each set containing a load case and an associated analysis command. Also, the members which get switched off in the analysis for any load case have to be restored for the analysis for the subsequent load case. To accommodate these requirements, it is necessary to have two commands, one called **SET NL** and the other called **CHANGE**. The **SET NL** command is used above to indicate the total number of primary load cases that the file contains. The **CHANGE** command will come in later (after the **PERFORM ANALYSIS** command).

**JOINT COORDINATES**
1 0 0 0 3 480. 0 0  
4 0 180. 0 6 480. 180. 0  
7 240. 360. 0 8 480. 360. 0  

Joint number followed by X, Y and Z coordinates are provided above. Since this is a plane structure, the Z coordinates are given as all zeros.

**Note:** Semicolons (;) are used as line separators to allow for input of multiple sets of data on one line.

**MEMBER INCIDENCE**
1 1 4 2 ; 3 5 7 ; 4 3 6 ; 5 6 8 ; 6 4 5 7  
8 7 8 ; 9 1 5 ; 10 2 4 ; 11 3 5 ; 12 2 6  
13 6 7 ; 14 5 8  

Defines the members by the joints to which they are connected.

**MEMBER TRUSS**
9 TO 14  

The preceding command defines that members 9 through 14 are of type truss. This means these members can only carry axial tension/compression and no moments.

**MEMBER PROP AMERICAN**
1 TO 5 TABLE ST W12X26  
6 7 8 TA ST W18X35  
9 TO 14 TA LD L50505  

Properties for all members are assigned from the American (AISC) steel table. The word **ST** stands for standard single section. The word **LD** stands for long leg back-to-back double angle. Since the spacing between the two angles of the double angle is not provided, it is assumed to be 0.0.

STRENGTH FY 36 FU 58 RY 1.5 RT 1.2  
**END DEFINE MATERIAL**
Define the material properties for steel. The units are changed to inches and then back to feet in order to facilitate inputing the values in familiar units.

```
CONSTANTS
MATERIAL STEEL ALL
```

The `CONSTANT` command initiates input for material definitions.

```
SUPPORT
1 2 3 PINNED
```

Pinned supports are specified at Joints 1, 2 and 3. The word `PINNED` signifies that no moments will be carried by these supports.

```
INACTIVE MEMBERS 9 TO 14
```

The preceding command makes the listed members inactive. The stiffness contribution of these members will not be considered in the analysis till they are made active again.

```
UNIT FT
LOADING 1 DEAD AND LIVE LOAD
```

Load case 1 is initiated followed by a title. The length `UNIT` is changed from `INCH` to `FT` for input values which follow.

```
MEMBER LOAD
6 8 UNI GY -1.0
7 UNI GY -1.5
```

Load 1 contains member loads. `GY` indicates that the load acts in the global Y direction. The word `UNI` stands for uniformly distributed load. The load is applied on members 6, 7, and 8.

```
PERFORM ANALYSIS
```

This command instructs the program to proceed with the analysis. It is worth noting that members 9 to 14 will not be used in this analysis since they were declared inactive earlier. In other words, for dead and live load, the bracing members are not used to carry any load.

```
CHANGES
```

The members inactivated earlier are restored using the `CHANGE` command.

```
INACTIVE MEMBERS 10 11 13
```

A new set of members are made inactive. The stiffness contribution from these members will not be used in the analysis till they are made active again. They have been inactivated to prevent them from being subject to compressive forces for the next load case.

```
LOADING 2 WIND FROM LEFT
```

Load case 2 is initiated followed by a title.

```
JOINT LOAD
4 FX 30 ; 7 FX 15
```

Load 2 contains joint loads. `FX` indicates that the load is a force in the global X direction. Nodes 4 and 7 are subjected to the loads.

```
PERFORM ANALYSIS
```

This command instructs the program to proceed with the analysis. The analysis will be performed for load case 2 only.

```
CHANGE
```
The above CHANGE command is an instruction to re-activate all inactive members.

**INACTIVE MEMBERS 9 12 14**

Members 9, 12 and 14 are made inactive. The stiffness contribution of these members will not be used in the analysis till they are made active again. They have been inactivated to prevent them from being subject to compressive forces for the next load case.

**LOADING 3 WIND FROM RIGHT**

Load case 3 is initiated followed by a title.

**JOINT LOAD**

6 FX -30 ; 8 FX -15

Load 3 contains joint loads at nodes 6 and 8. FX indicates that the load is a force in the global X direction. The negative numbers (-30 and -15) indicate that the load is acting along the negative global X direction.

**LOAD COMBINATION 4**

1 0.75 2 0.75

**LOAD COMBINATION 5**

1 0.75 3 0.75

Load combination case 4 involves the algebraic summation of the results of load cases 1 and 2 after multiplying each by a factor of 0.75. For load combinations, the program simply gathers the results of the component primary cases, factors them appropriately, and combines them algebraically. Thus, an analysis in the real sense of the term (multiplying the inverted stiffness matrix by the load vector) is not carried out for load combination cases. Load combination case 5 combines the results of load cases 1 and 3.

**PERFORM ANALYSIS**

This command instructs the program to proceed with the analysis. Only primary load case 3 will be considered for this analysis. (As explained earlier, a combination case is not truly analyzed for, but handled using other means.)

**CHANGE**

The above CHANGE command will re-activate all inactive members.

**LOAD LIST ALL**

At the end of any analysis, only those load cases for which the analysis was done most recently, are recognized as the "active" load cases. The LOAD LIST ALL command enables all the load cases in the structure to be made active for further processing.

**PRINT MEMBER FORCES**

The preceding PRINT command is an instruction to produce a report, in the output file, of the member end forces.

**LOAD LIST 1 4 5**

A LOAD LIST command is a means of instructing the program to use only the listed load cases for further processing.

**PARAMETER**

**CODE AISC UNIFIED**

**BEAM 1.0 ALL**

**UNT 6.0 ALL**

**UNB 6.0 ALL**

**KY 0.5 ALL**
The **PARAMETER** command is used to specify the steel design parameters (information on these parameters can be obtained from the manual where the implementation of the code is explained). Design will be done according to the specifications of the AISC ASD Code. The **BEAM** parameter is specified to perform design at every 1/12th point along the member length. **UNT** and **UNB** represent the unsupported length of the flanges to be used for calculation of allowable bending stress. **KY 0.5 ALL** sets the effective length factor for column buckling about the local Y-axis to be 0.5 for ALL members.

```
CHECK CODE ALL
```

The above command instructs the program to perform a check to determine how you defined member sizes along with the latest analysis results meet the code requirements.

```
FINISH
```

This command terminates the STAAD run.

*** DESIGN MESSAGES ***:

1. Section classification reported is for the cross section and loadcase that produced the worst case design ratio for flexure/compression Capacity results.
2. Results for any Capacity/Check that is not relevant for a section/loadcase based on the code clause in AISC 360-16 will not be shown in the report.
3. Bending results are reported as being about the relevant axis (X/Y), while the results for shear are reported as being for shear forces along the axis. E.g: Mx indicates bending about the X axis, while Vx indicates shear along the X axis.

*** ABBREVIATIONS ***:

- F-T-B = Flexural-Torsional Buckling
- L-T-B = Lateral-Torsional Buckling
- F-L-B = Flange Local Buckling
- W-L-B = Web Local Buckling
- L-L-B = Leg Local Buckling
- C-F-Y = Compression Flange Yielding
- T-F-Y = Tension Flange Yielding

EX. US-5 Support Settlement on a Portal Frame

This example demonstrates the application of support displacement load (also known as a sinking support) on a space frame structure.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US\US-5 Support Settlement on a Portal Frame.STD when you install the program.

Where:

L1 = 10 ft
L2 = 20 ft

Actual input is shown in bold lettering followed by explanation.

STAAD SPACE TEST FOR SUPPORT DISPLACEMENT

Every input has to start with the term STAAD. The word SPACE signifies that the structure is a space frame structure (3-D) and the geometry is defined through X, Y and Z coordinates.

UNITS KIP FEET

Defines the input units for the data that follows.

<table>
<thead>
<tr>
<th>JOINT COORDINATES</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 0.0 0.0 0.0 ; 2 0.0 10.0 0.0</td>
</tr>
<tr>
<td>3 20.0 10.0 0.0 ; 4 20.0 0.0 0.0</td>
</tr>
<tr>
<td>5 20. 10. 20. ; 6 20. 0. 20.</td>
</tr>
</tbody>
</table>

Joint number followed by X, Y and Z coordinates are provided above.
**Note:** Semicolons (;) are used as line separators to allow for input of multiple sets of data on one line.

<table>
<thead>
<tr>
<th>MEMBER INCIDENCE</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 1 2 3</td>
</tr>
<tr>
<td>4 3 5 ; 5 5 6</td>
</tr>
</tbody>
</table>

Defines the members by the joints to which they are connected.

<table>
<thead>
<tr>
<th>UNIT INCH MEMB PROP</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 TO 5 PRIS AX 10. IZ 300. IY 300. IX 10.</td>
</tr>
</tbody>
</table>

Member properties have been defined above using the PRISMATIC attribute. Values of AX (area), IZ (moment of inertia about major axis), IY (moment of inertia about minor axis) and IX (torsional constant) are provided in INCH unit.

<table>
<thead>
<tr>
<th>DEFINE MATERIAL START</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISOTROPIC STEEL</td>
</tr>
<tr>
<td>E 29000.</td>
</tr>
<tr>
<td>POISSON 0.3</td>
</tr>
<tr>
<td>DENSITY 283e-006</td>

</tr>
<tr>
<td>END DEFINE MATERIAL</td>
</tr>
<tr>
<td>CONSTANT</td>
</tr>
<tr>
<td>MATERIAL STEEL ALL</td>
</tr>
</tbody>
</table>

Material are defined using the DEFINE MATERIAL command and then assigned using the CONSTANT command.

<table>
<thead>
<tr>
<th>SUPPORT</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 4 6 FIXED</td>
</tr>
</tbody>
</table>

Joints 1, 4 and 6 are fixed supports.

<table>
<thead>
<tr>
<th>LOADING 1 SINKING SUPPORT</th>
</tr>
</thead>
</table>

Load case 1 is initiated followed by a title.

<table>
<thead>
<tr>
<th>SUPPORT DISPLACEMENT LOAD</th>
</tr>
</thead>
<tbody>
<tr>
<td>4 FY -0.50</td>
</tr>
</tbody>
</table>

Load 1 is a support displacement load which is also commonly known as a sinking support. FY signifies that the support settlement is in the global Y direction and the value of this settlement is 0.5 inch downward.

<table>
<thead>
<tr>
<th>PERFORM ANALYSIS</th>
</tr>
</thead>
</table>

This command instructs the program to proceed with the analysis.

<table>
<thead>
<tr>
<th>PRINT ANALYSIS RESULTS</th>
</tr>
</thead>
</table>

The above PRINT command instructs the program to print joint displacements, support reactions and member forces.

<table>
<thead>
<tr>
<th>FINISH</th>
</tr>
</thead>
</table>

This command terminates the STAAD run.

User Manual
EX. US-6 Prestress and Poststress Loading

This is an example of prestress loading in a plane frame structure.

It covers two situations:

1. From the member on which it is applied, the prestressing effect is transmitted to the rest of the structure through the connecting members (known in the program as PRESTRESS load).
2. The prestressing effect is experienced by the member(s) alone and not transmitted to the rest of the structure (known in the program as POSTSTRESS load).

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US\US-6 Prestress and Poststress Loading.STD when you install the program.
Figure 511: Example Problem No. 6

Where:

\[ L1 = 15 \text{ ft} \]
\[ L2 = 20 \text{ ft} \]
\[ L3 = 40 \text{ ft} \]

Actual input is shown in bold lettering followed by explanation.

**STAAD PLANE FRAME WITH PRESTRESSING LOAD**

Every input has to start with the term **STAAD**. The term **PLANE** signifies that the structure is a plane frame structure and the geometry is defined through X and Y axes.

**UNIT KIP FT**

Defines the input units for the data that follows.

**JOINT COORD**

1 0. 0. ; 2 40. 0. ; 3 0. 20. ; 4 40. 20.
5 0. 35. ; 6 40. 35. ; 7 0. 50. ; 8 40. 50.

Joint number followed by X and Y coordinates are provided above. Since this is a plane structure, the Z coordinates need not be provided.

**Note:** Semicolons (;) are used as line separators to allow for input of multiple sets of data on one line.

**MEMBER INCIDENCE**

1 1 3 ; 2 3 5 ; 3 5 7 ; 4 2 4 ; 5 4 6
6 6 8 ; 7 3 4 ; 8 5 6 ; 9 7 8
Defines the members by the joints to which they are connected.

```
SUPPORT
  1  2  FIXED
```

The supports at joints 1 and 2 are defined to be fixed supports.

```
MEMB PROP
  1  TO  9  PRI  AX  2.2  IZ  1.0
```

Member properties are provided using the PRI (prismatic) attribute. Values of area (AX) and moment of inertia about the major axis (IZ) are provided.

```
UNIT INCH
DEFINE MATERIAL START
ISOTROPIC CONCRETE
  E   3000.
  POISSON  0.17
  DENSITY  8.7e-005
  ALPHA  5e-006
  DAMP  0.05
  G  1346.15
  TYPE CONCRETE
STRENGTH FCU  4
END DEFINE MATERIAL
CONSTANTS
MATERIAL CONCRETE ALL
```

The `DEFINE MATERIAL` command is used to specify material properties and the `CONSTANT` command is used to assign the material to all members. Length unit is changed from FT to INCH to facilitate the input.

```
LOADING 1  PRESTRESSING LOAD
MEMBER PRESTRESS
  7  8  FORCE  300.  ES  3.  EM -12.  EE  3.
```

Load case 1 is initiated along with an accompanying title. Load 1 contains PRESTRESS load. Members 7 and 8 have a cable force of 300 kips. The location of the cable at the start (ES) and end (EE) is 3 inches above the center of gravity while at the middle (EM) it is 12 inches below the c.g. The assumptions and facts associated with this type of loading are explained in G.15.5 Prestress and Poststress Member Load (on page 2108).

```
LOADING 2  POSTSTRESSING LOAD
MEMBER POSTSTRESS
  7  8  FORCE  300.  ES  3.  EM -12.  EE  3.
```

Load case 2 is initiated along with an accompanying title. Load 2 is a POSTSTRESS load. Members 7 and 8 have cable force of 300 kips. The location of the cable is the same as in load case 1. For a difference between PRESTRESS loading and POSTSTRESS loading, as well as additional information about both types of loads, please refer to G.15.5 Prestress and Poststress Member Load (on page 2108).

```
PERFORM ANALYSIS
```

This command instructs the program to perform the analysis.

```
UNIT FT
PRINT ANALYSIS RESULT
```

The preceding command is an instruction to write joint displacements, support reactions and member forces in the output file. The preceding line causes the results to be written in the length unit of feet.

```
FINISH
```

This command terminates the STAAD run.

### EX. US-7 Modeling Offset Connections in a Frame

This example illustrates modeling of structures with offset connections. Offset connections arise when the center lines of the connected members do not intersect at the connection point. The connection eccentricity behaves as a rigid link and is modeled through specification of **MEMBER OFFSETS**.

This problem is installed with the program by default to 
C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US \US-7 Modeling Offset Connections in a Frame.STD when you install the program.
Where:

L1 = 15 ft
L2 = 20 ft
L3 = 7 in
L4 = 6 in

Actual input is shown in bold lettering followed by explanation.

**STAAD PLANE TEST FOR MEMBER OFFSETS**

Every input has to start with the term `STAAD`. The term `PLANE` signifies that the structure is a plane frame structure and the geometry is defined through X and Y axes.

**UNIT FT KIP**

Defines the input units for the data that follows.

```
JOINT COORD
1 0. 0. ; 2 20. 0. ; 3 0. 15.
4 20. 15. ; 5 0. 30. ; 6 20. 30.
```

Joint number followed by X and Y coordinates are provided above. Since this is a plane structure, the Z coordinates need not be provided.

**Note:** Semicolons (;) are used as line separators to allow for input of multiple sets of data on one line.

```
SUPPORT
1 2 PINNED
```
Pinned supports are specified at joints 1 and 2. The word PINNED signifies that no moments will be carried by these supports.

```
MEMB INCI
  1 1 3 2 ; 3 3 5 4
  5 3 4 ; 6 5 6 ; 7 1 4
```

Defines the members by the joints to which they are connected.

```
MEMB PROP AMERICAN
  1 TO 4 TABLE ST W14X90
  5 6 TA ST W12X26
  7 TA LD L80608
```

Member properties are assigned from the American (AISC) steel table for all members. The word ST stands for standard single section. LD stands for long leg back-to-back double angle.

**Note:** This problem uses a steel size from an older AISC catalog. In order to use this shape for analysis and design, you must select `AISCSections` or `aiscsections_all_editions` database for use as the American section profile table.

```
UNIT INCH
MEMB OFFSET
  5 6 START 7.0 0.0 0.0
  5 6 END -7.0 0.0 0.0
  7 END -7.0 -6.0 0.0
```

The preceding specification states that an OFFSET is located at the START/END joint of the members. The X, Y, and Z global coordinates of the offset distance from the corresponding incident joint are also provided. These attributes are applied to members 5, 6, and 7.

```
DEFINE MATERIAL START
  ISOTROPIC STEEL
  E 29000.
  POISSON 0.3
  DENSITY 283e-006
  ALPHA 6e-006
  DAMP 0.03
  TYPE STEEL
  STRENGTH FY 36 FU 58 RY 1.5 RT 1.2
END DEFINE MATERIAL
CONSTANT
  MATERIAL STEEL ALL
```

The DEFINE MATERIAL command is used to specify material properties and the CONSTANT is used to assign the material to all members.

```
LOADING 1 WIND LOAD
```

Load case 1 is initiated followed by a title.

```
JOINT LOAD
  3 FX 50. ; 5 FX 25.0
```

Load 1 contains joint loads at nodes 3 and 5. FX indicates that the load is a force in the global X direction.

```
PERFORM ANALYSIS
```
The above command is an instruction to perform the analysis.

UNIT FT
PRINT FORCES
PRINT REACTIONS

The above PRINT commands are instructions for writing the member forces and support reactions to the output file. The preceding line causes the results to be written in the length unit of feet.

FINISH

This command terminates a STAAD run.

### EX. US-8 Concrete Design for a Space Frame

In this example, concrete design is performed on some members of a space frame structure. Design calculations consist of computation of reinforcement for beams and columns. Secondary moments on the columns are obtained through the means of a P-Delta analysis.

This problem is installed with the program by default to
C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US \US-8 Concrete Design for a Space Frame.STD when you install the program.
The above example represents a space frame, and the members are made of concrete. The input in the next page will show the dimensions of the members.

Two load cases, namely one for dead plus live load and another with dead, live and wind load, are considered in the design.

Actual input is shown in bold lettering followed by explanation.

**STAAD SPACE FRAME WITH CONCRETE DESIGN**

Every input has to start with the term STAAD. The word SPACE signifies that the structure is a space frame structure (3-D) and the geometry is defined through X, Y and Z coordinates.

**UNIT KIP FT**

Defines the input units for the data that follows.

**JOINT COORDINATE**

</table>

Joint number followed by X, Y and Z coordinates are provided above.
**Note:** Semicolons (;) are used as line separators to allow for input of multiple sets of data on one line.

### MEMBER INCIDENCE

```
1 1 7 ; 2 4 10 ; 3 2 8 ; 4 8 13
5 5 11 ; 6 11 15 ; 7 3 9 ; 8 9 14
9 6 12 ; 10 12 16 ; 11 7 8 12
13 10 11 14 ; 15 13 14 ; 16 15 16
17 7 10 ; 18 8 11 ; 19 9 12
20 13 15 ; 21 14 16
```

Defines the members by the joints to which they are connected.

### UNIT INCH

### MEMB PROP

```
1 2 PRISMATIC YD 12.0 IZ 509. IY 509. IX 1018.
3 TO 10 PR YD 12.0 ZD 12.0 IZ 864. IY 864. IX 1279.
11 TO 21 PR YD 21.0 ZD 16.0 IZ 5788. IY 2953. IX 6497.
```

All member properties are provided using the PRISMATIC option. YD and ZD stand for depth and width. If ZD is not provided, a circular shape with diameter = YD is assumed for that cross section. All properties required for the analysis, such as, Area, Moments of Inertia, etc. are calculated automatically from these dimensions unless these are explicitly defined. For this particular example, moments of inertia (IZ, IY) and torsional constant (IX) are provided, so these will not be recalculated. The IX, IY, and IZ values provided in this example are only half the values of a full section to account for the fact that the full moments of inertia will not be effective due to cracking of concrete. Clause 10.11.1 of ACI 318-99 offers some guidelines on the amount of reduction to be applied on the gross section moment of inertia for beams, columns, walls and slabs to account for cracking.

### DEFINE MATERIAL START

- **UNIT FT**

The `DEFINE MATERIAL` command is used to define material properties for concrete. The `CONSTANT` command is used to assign this to all members.

### SUPPORT

```
1 TO 6 FIXED
```

Joints 1 to 6 are fixed supports.

### LOAD 1 (1.4DL + 1.7LL)

Load case 1 is initiated followed by a title.

```
SELF Y -1.4
```

The selfweight of the structure is applied in the global Y direction with a -1.4 factor. Since global Y is vertically upward, the negative factor indicates that this load will act downwards.
Load 1 contains member loads also. Y indicates that the load is in the local Y direction. The word UNI stands for uniformly distributed load.

Load case 2 is initiated followed by a title.

The preceding command will gather the load data values from load case 1, multiply them with a factor of 0.75 and utilize the resulting values in load 2.

Load 2 contains some additional joint loads also. FZ indicates that the load is a force in the global Z direction.

This command instructs the program to proceed with the analysis. The analysis type is P-DELTA indicating that second-order effects are to be calculated.

Member end forces are printed using the above PRINT commands. The LIST option restricts the print output to the members listed.

The above command initiates a concrete design.

The values for the concrete design parameters are defined in the above commands. Design is performed per the ACI 318 Code. The TRACK value dictates the extent of design related information that should appear in the output. MAXMAIN indicates that the maximum size of main reinforcement is the #11 bar. These parameters are described in the manual where American concrete design related information is available.

The above command instructs the program to design beams 14 and 16 for flexure, shear, and torsion.

The above command instructs the program to design columns 2 and 5 for axial load and biaxial bending.

This command terminates the STAAD run.

EX. US-9 Modeling Slabs and Shear Walls Using Finite Elements

The space frame structure in this example consists of frame members and finite elements (plates). The finite element part is used to model floor slabs and a shear wall. Concrete design of an element is performed.
This problem is installed with the program by default to 
C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US \US-9 Modeling Slabs and Shear Walls Using Finite Elements.STD when you install the program.

Figure 514: Example Problem No. 9

Actual input is shown in bold lettering followed by explanation.

```
STAAD SPACE
* EXAMPLE PROBLEM WITH FRAME MEMBERS AND FINITE ELEMENTS

Every STAAD input file has to begin with the word STAAD. The word SPACE signifies that the structure is a space frame and the geometry is defined through X, Y and Z axes. The second line forms the title to identify this project.

UNIT FEET KIP

The units for the data that follows are specified above.

29 40 15 0 33 40 15 20
The joint numbers and their coordinates are defined through the above set of commands. The automatic generation facility has been used several times in the above lines. See TR.11 Joint Coordinates Specification (on page 2193) where the joint coordinate generation facilities are described.

37 22 26 ; 38 26 27 ; 39 27 28 ; 40 28 33

The member incidences are defined through the above set of commands. For some members, the member number followed by the start and end joint numbers are defined. In other cases, STAAD's automatic generation facilities are utilized. Refer to TR.12 Member Incidences Specification (on page 2197) for additional details.

DEFINE MESH
A JOINT 7
B JOINT 11
C JOINT 22
D JOINT 18
E JOINT 33
F JOINT 29
G JOINT 3
H JOINT 4

The above lines define the nodes of super-elements. Super-elements are plate/shell surfaces from which a number of individual plate/shell elements can be generated. In this case, the points describe the outer corners of a slab and that of a shear wall. Our goal is to define the slab and the wall as several plate/shell elements.

GENERATE ELEMENT
MESH ABCD 4 4
MESH DCEF 4 4
MESH DCHG 4 4

The above lines form the instructions to generate individual 4-noded elements from the super-element profiles. For example, the command MESH ABCD 4 4 means that STAAD.Pro has to generate 16 elements from the surface formed by the points A, B, C and D with 4 elements along the edges AB & CD and 4 elements along the edges BC & DA.

MEMB PROP
1 TO 40 PRIS YD 1 ZD 1

Members 1 to 40 are defined as a rectangular prismatic section with 1 ft depth and 1 ft width.

ELEM PROP
41 TO 88 TH 0.5
Elements 41 to 88 are defined to be 0.5 ft thick.

```
UNIT INCH

DESIGN ELEMENT 47
END CONCRETE DESIGN
```

---

**STAAD.Pro** 6319  *User Manual*
The above set of command form the instructions to STAAD to perform a concrete design on element 47. Design is done according to the ACI 318 code. Note that design will consist only of flexural reinforcement calculations in the longitudinal and transverse directions of the elements for the moments MX and MY.

FINI

The STAAD run is terminated.

**EX. US-10 Finite Element Model for a Rectangular Tank**

A tank structure is modeled with four-noded plate elements. Water pressure from inside is used as loading for the tank. Reinforcement calculations have been done for some elements.

This problem is installed with the program by default to C:/Users/Public/Public Documents/STAAD.Pro CONNECT Edition/Samples/Sample Models/US/US-10 Finite Element Model for a Rectangular Tank.STD when you install the program.

---

*Figure 515: Tank Model*

*Figure 516: Deflected Shape*
Actual input is shown in bold lettering followed by explanation.

STAAD SPACE FINITE ELEMENT MODEL OF TANK
* STRUCTURE

Every input has to start with the term STAAD. The word SPACE signifies that the structure is a space frame (3-D) structure.

UNITS FEET KIPS

Defines the input units for the data that follows.

JOINT COORDINATES

<table>
<thead>
<tr>
<th>Joint number</th>
<th>X</th>
<th>Y</th>
<th>Z</th>
<th>Increment</th>

</tbody>
</table>

Element connectivities are input as above by providing the element number followed by joint numbers defining the element. The REPEAT command generates element incidences by repeating the pattern of the previous line of element nodes. The number following the REPEAT command is the number of repetitions to be carried out and that is followed by element and joint number increments. See TR.12 Member Incidences Specification (on page 2197).

The DEFINE MATERIAL command is used to specify material properties and the CONSTANT is used to assign the material to all members.

SUPPORT 1 TO 76 BY 5 81 TO 89 PINNED

Pinned supports are specified at the joints listed above. No moments will be carried by these supports. The expression 1 TO 76 BY 5 means 1, 6, 11, etc. up to 76.

UNIT FT
LOAD 1
ELEMENT LOAD
4 TO 64 BY 4 PR 1.
3 TO 63 BY 4 PR 2.
2 TO 62 BY 4 PR 3.
1 TO 61 BY 4 PR 4.

Load case 1 is initiated. It consists of element loads in the form of uniform pressure (indicated by PR) acting along the local z-axis.

PERFORM ANALYSIS

This command instructs the program to proceed with the analysis.

UNIT INCHES
PRINT JOINT DISPLACEMENTS LIST 5 25 45 65

The joint displacement values for the listed nodes will be reported in the output file as a result of the above command.

PRINT ELEM FORCE LIST 13 16
PRINT ELEM STRESS LIST 9 12

Two types of results are requested for elements. The first one requests the nodal point forces in the global axes directions to be reported for elements 13 and 16. The second one requests element centroid stresses in the element local axes directions to be reported for elements 9 and 12. These results will appear in a tabular form in the output file.

START CONCRETE DESIGN

The above command initiates concrete design.

CODE ACI
DESIGN SLAB 9 12

Slabs (i.e., elements) 9 and 12 will be designed and the reinforcement requirements obtained. In STAAD, elements are typically designed for the moments MX and MY at the centroid of the element.

END CONCRETE DESIGN
Terminates the concrete design operation.

This command terminates the STAAD run.

EX. US-11 Response Spectrum Analysis of a Frame

Dynamic analysis (Response Spectrum) is performed for a steel structure. Results of a static and dynamic analysis are combined. The combined results are then used for steel design.

This problem is installed with the program by default to
C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US\US-11 Response Spectrum Analysis of a Frame.STD when you install the program.

Where:

- $L_1 = 10$ ft, $L_2 = 20$ ft
- $w = 1.5$ k/ft
- $P_1 = 5.0$ kips, $P_2 = 7.5$ kips

Actual input is shown in bold lettering followed by explanation.
Every input has to start with the term STAAD. The term PLANE signifies that the structure is a plane frame structure and the geometry is defined through X and Y axes.

UNIT FEET KIPS

Defines the input units for the data that follows.

<table>
<thead>
<tr>
<th>JOINT COORDINATES</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 0 0 0 ; 2 20 0 0</td>
</tr>
<tr>
<td>3 0 10 0 ; 4 20 10 0</td>
</tr>
<tr>
<td>5 0 20 0 ; 6 20 20 0</td>
</tr>
</tbody>
</table>

Joint number followed by X, Y and Z coordinates are provided above. Since this is a plane structure, the Z coordinates are all the same, in this case, zeros.

**Note:** Semicolons (;) are used as line separators to allow for input of multiple sets of data on one line.

<table>
<thead>
<tr>
<th>MEMBER INCIDENCES</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 1 3 ; 2 2 4 ; 3 3 5 ; 4 4 6</td>
</tr>
<tr>
<td>5 3 4 ; 6 5 6</td>
</tr>
</tbody>
</table>

Defines the members by the joints to which they are connected.

<table>
<thead>
<tr>
<th>MEMBER PROPERTIES AMERICAN</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 TO 4 TA ST W10X33</td>
</tr>
<tr>
<td>5 TA ST W12X40</td>
</tr>
<tr>
<td>6 TA ST W8X40</td>
</tr>
</tbody>
</table>

Properties for all members are assigned from the American (AISC) steel table. The word ST stands for standard single section.

<table>
<thead>
<tr>
<th>SUPPORTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 2 FIXED</td>
</tr>
</tbody>
</table>

Fixed supports are specified at joints 1 and 2.

Material constants such as E (modulus of elasticity), Poisson's ratio and density (DEN) are specified above. Length unit is changed from FT to INCH to facilitate the input.

**CUT OFF MODE SHAPE 2**

The number of mode shapes to be considered in dynamic analysis is set to 2. Without the above command, this will be set to the default. See TR.30.1 Cut-Off Frequency, Mode Shapes, or Time (on page 2319).

<table>
<thead>
<tr>
<th>LOAD 1 WILL BE STATIC LOAD</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNIT FEET</td>
</tr>
<tr>
<td>LOAD 1 DEAD AND LIVE LOADS</td>
</tr>
</tbody>
</table>
Load case 1 is initiated followed by a title. Prior to this, the length unit is changed to METER for specifying distributed member loads. A line starting with an asterisk (*) mark indicates a comment line.

```
SELFWEIGHT Y -1.0
```

The above command indicates that the selfweight of the structure acting in the global Y direction is part of this load case. The factor of -1.0 is meant to indicate that the load acts opposite to the positive direction of global Y, hence downwards.

```
MEMBER LOADS
5 CON GY -5.0 6.0
5 CON GY -7.5 10.0
5 CON GY -5.0 14.0
5 6 UNI Y -1.5
```

Load 1 contains member loads also. GY indicates that the load is in the global Y direction while Y indicates local Y direction. The word UNI stands for uniformly distributed load while CON stands for concentrated load. GY is followed by the value of the load and the distance at which it is applied.

```
* NEXT LOAD WILL BE RESPONSE SPECTRUM LOAD
* WITH MASSES PROVIDED IN TERMS OF LOAD.
LOAD 2 SEISMIC LOADING
```

The two lines which begin with the asterisk are comment lines which tell us the purpose of the next load case. Load case 2 is then initiated along with an optional title. This will be a dynamic load case. Permanent masses will be provided in the form of loads. These masses (in terms of loads) will be considered for the eigensolution. Internally, the program converts these loads to masses, hence it is best to specify them as absolute values (without a negative sign). Also, the direction (X, Y, Z etc.) of the loads will correspond to the dynamic degrees of freedom in which the masses are capable of vibrating. In a PLANE frame, only X and Y directions need to be considered. In a SPACE frame, masses (loads) should be provided in all three (X, Y and Z) directions if they are active along all three. The user has the freedom to restrict one or more directions.

```
SELFWEIGHT X 1.0
SELFWEIGHT Y 1.0
```

The above commands indicate that the selfweight of the structure acting in the global X and Y directions with a factor of 1.0 is taken into consideration for the mass matrix.

```
MEMBER LOADS
5 CON GX 5.0 6.0
5 CON GY 5.0 6.0
5 CON GX 7.5 10.0
5 CON GY 7.5 10.0
5 CON GX 5.0 14.0
5 CON GY 5.0 14.0
```

The mass matrix will also consist of terms derived from the above member loads. GX and GY indicate that the load, and hence the resulting mass, is capable of vibration along the global X and Y directions. The word CON stands for concentrated load. Concentrated forces of 5, 7.5, and 5 kips are located at 6ft, 10ft and 14ft from the start of member 5.

```
SPECTRUM CQC IBC 2012 X 1.0 ACC DAMP 0.05
ZIP 92806 SITE CLASS D TL 12.0
```

The SPECTRUM command specifies a 2012 International Building Code / ASCE 7-10 seismic response spectrum load. The modal responses will be combined using the CQC method. Here, the spectrum effect is in the global X direction with a factor of 1.0. IBC 2012 response spectra are always given in terms of acceleration (ACC). A
A damping ratio of 0.05 (5%) is used. The second line then gives the location and site class values (using the US ZIP postal code and IBC/ASCE site class) along with the long period transition time.

A steel design in the form of a member selection is performed based on the rules of the American Code. Only the member forces resulting from load cases 1, 3 and 4 will be considered for these calculations.

This command terminates the STAAD run.

</tr>
</tbody>
</table>

#### *** DESIGN MESSAGES ***:

1. Section classification reported is for the cross section and loadcase that produced the worst case design ratio for flexure/compression Capacity results.
2. Results for any Capacity/Check that is not relevant for a section/loadcase based on the code clause in AISC 360-16 will not be shown in the report.
3. Bending results are reported as being \( \text{\textit{about}} \) the relevant axis (X/Y), while the results for shear are reported as being for shear forces \( \text{\textit{along}} \) the axis.
   
   E.g : \( \text{Mx} \) indicates bending about the X axis, while \( \text{Vx} \) indicates shear along the X axis.

#### *** ABBREVIATIONS ***:

- **F-T-B** = Flexural-Torsional Buckling
- **L-T-B** = Lateral-Torsional Buckling
- **F-L-B** = Flange Local Buckling
- **W-L-B** = Web Local Buckling
- **L-L-B** = Leg Local Buckling
- **C-F-Y** = Compression Flange Yielding

EX. US-12 Moving Load Generation on a Bridge Deck

This example demonstrates generation of load cases for the type of loading known as a moving load. This type of loading occurs classically when the load-causing units move on the structure, as in the case of trucks on a bridge deck. The mobile loads are discretized into several individual immobile load cases at discrete positions. During this process, enormous number of load cases may be created resulting in plenty of output to be sorted. To avoid looking into a lot of output, the maximum force envelope is requested for a few specific members.

This problem is installed with the program by default to
\texttt{C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US \US-12 Moving Load Generation on a Bridge Deck.STD} when you install the program.

\textit{Figure 518: Example Problem No. 12}

Where:
Actual input is shown in bold lettering followed by explanation.

**STAAD** FLOOR A SIMPLE BRIDGE DECK

Every input has to start with the term **STAAD**. The word **FLOOR** signifies that the structure is a floor structure and the geometry is defined through X and Z axis.

**UNITS FEET KIPS**

Defines the input units for the data that follows.

**JOINT COORDINATES**

<table>
<thead>
<tr>
<th>1</th>
<th>0</th>
<th>0</th>
<th>0</th>
<th>6</th>
<th>25</th>
<th>0</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>R</td>
<td>5</td>
<td>0</td>
<td>0</td>
<td>30</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Joint number followed by X, Y, and Z coordinates are provided above. Since this is a floor structure, the Y coordinates are all the same (in this case, zero). The first line generates joints 1 through 6. With the repeat (R) command, the coordinates of the next 30 joints are generated by repeating the pattern of the coordinates of the first 6 joints 5 times with X, Y and Z increments of 0,0, and 9 respectively.

**MEMBER INCIDENCES**

<table>
<thead>
<tr>
<th>1</th>
<th>1</th>
<th>7</th>
<th>6</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>1</td>
<td>2</td>
<td>11</td>
</tr>
<tr>
<td>R</td>
<td>A</td>
<td>4</td>
<td>11</td>
</tr>
<tr>
<td>56</td>
<td>31</td>
<td>32</td>
<td>60</td>
</tr>
</tbody>
</table>

Defines the members by the joints to which they are connected. The fourth number indicates the final member number up to which they will be generated. Repeat all (abbreviated as R A) will create members by repeating the member incidence pattern of the previous 11 members. The number of repetitions to be carried out is provided after the RA command and the member increment and joint increment are defined as 11 and 6 respectively. The fifth line of input defines the member incidences for members 56 to 60.

**MEMBER PROPERTIES AMERICAN**

| 1 TO 60 TA ST W12X26 |

Member properties are assigned from the American AISC table for all members. The word ST stands for standard single section.

**SUPPORTS**

| 1 TO 6 31 TO 36 PINNED |

Pinned supports are specified at the above joints. A pinned support is one which can resist only translational forces.

**UNITS INCH**

**DEFINE MATERIAL START**

<table>
<thead>
<tr>
<th>ISOTROPIC STEEL</th>
</tr>
</thead>
<tbody>
<tr>
<td>E 29000.</td>
</tr>
<tr>
<td>POISSON 0.3</td>
</tr>
<tr>
<td>DENSITY 283e-006</td>
</tr>
<tr>
<td>ALPHA 6e-006</td>
</tr>
<tr>
<td>DAMP 0.03</td>
</tr>
<tr>
<td>TYPE STEEL</td>
</tr>
<tr>
<td>STRENGTH FY 36</td>
</tr>
<tr>
<td>FU 58</td>
</tr>
<tr>
<td>RY 1.5</td>
</tr>
<tr>
<td>RT 1.2</td>
</tr>
</tbody>
</table>

**END DEFINE MATERIAL**

**CONSTANT**

**MATERIAL STEEL ALL**
The input units are changed from FT to INCH. The \texttt{DEFINE MATERIAL} command is used to specify material properties and the \texttt{CONSTANT} is used to assign the material to all members.

\begin{verbatim}
UNIT FEET KIP
DEFINE MOVING LOAD
  TYPE 1 LOAD 20. 20. 10. DISTANCE 10. 5. WIDTH 10.0
\end{verbatim}

The characteristics of the vehicle are defined above in METER and KNS units. The above lines represent the first out of two sets of data required in moving load generation. The type number (1) is a label for identification of the load-causing unit, such as a truck. Three axles (20 20 10) are specified with the \texttt{LOAD} command. The spacing between the axles in the direction of movement (longitudinal direction) is specified after the \texttt{DISTANCE} command. WIDTH is the spacing in the transverse direction, that is, it is the distance between the 2 prongs of an axle of the truck.

\texttt{LOAD 1}

Load case 1 is initiated.

\texttt{SELF Y -1.0}

Selfweight of the structure acting in the negative (due to the factor -1.0) global Y direction is the only component of load case 1.

\begin{verbatim}
LOAD GENERATION 10
  TYPE 1 7.5 0. 0. ZI 10.
\end{verbatim}

This constitutes the second of the two sets of data required for moving load generation. 10 load cases are generated using the Type 1 vehicle whose characteristics were described earlier. For the first of these load cases, the \texttt{X, Y and Z location of the reference load (see TR.31.1 Definition of Moving Load System (on page 2321)) have been specified after the command \texttt{TYPE 1}. The Z Increment of 10ft denotes that the vehicle moves along the Z direction and the individual positions which are 10ft apart will be used to generate the remaining 9 load cases.

When defining a moving load in STAAD.Pro, the reference wheel is on the last axle. The first load case which is generated will be the one for which the first axle is just about to enter the bridge. The last load case should be the one for which the last axle is just about to exit the bridge. Thus, the total distance travelled by the reference load will be the length of the vehicle (distance from first axle to last axle) plus the span of the bridge. In this problem, that comes to

\[(10+5) + 150 = 165 \text{ feet}.\]

This example uses 10 ft increments and generates 10 load cases.

However, if you want the vehicle to move forward in 15 feet increments (each 15 foot increment will create a discrete position of the truck on the bridge), it would required \[(165/15)+1 = 12\] cases to be generated.

\texttt{PERFORM ANALYSIS PRINT LOAD}

The above command instructs the program to proceed with the analysis and print the values and positions of all the generated load cases.

\texttt{PRINT MAXFORCE ENVELOP LIST 3 41 42}

A maximum force envelope consisting of the highest forces for each degree of freedom on the listed members will be written into the output file.

\texttt{FINISH}

This command terminates the STAAD run.

*****************************************************************
EX. US-13 Section Displacements for a Frame

Calculation of displacements at intermediate points of members of a plane frame is demonstrated in this example.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US \US-13 Section Displacements for a Frame.STD when you install the program.

Where:

L1 = 15 ft, L2 = 20 ft
P = 5.0 k
w = 3.0 k/ft

The dashed line represents the deflected shape of the structure. The shape is generated on the basis of displacements at the ends plus several intermediate points of the members.
Actual input is shown in bold lettering followed by explanation.

```plaintext
STAAD PLANE TEST FOR SECTION DISPLACEMENT

Every input has to start with the term STAAD. The term PLANE signifies that the structure is a plane frame structure and the geometry is defined through X and Y axes.

UNIT KIP FEET

Defines the input units for the data that follows.

<table>
<thead>
<tr>
<th>Joint number</th>
<th>X coordinate</th>
<th>Y coordinate</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0.0</td>
<td>0.0</td>
</tr>
<tr>
<td>2</td>
<td>0.0</td>
<td>15.0</td>
</tr>
<tr>
<td>3</td>
<td>20.0</td>
<td>15.0</td>
</tr>
<tr>
<td>4</td>
<td>20.0</td>
<td>0.0</td>
</tr>
</tbody>
</table>

Joint number followed by X and Y coordinates are provided above. Since this is a plane structure, the Z coordinates need not be provided.

**Note:** Semicolons (;) are used as line separators to allow for input of multiple sets of data on one line.

MEMBER INCIDENCE

<table>
<thead>
<tr>
<th>Joint number1</th>
<th>Joint number2</th>
<th>Joint number3</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
<td>3</td>
</tr>
<tr>
<td>3</td>
<td>3</td>
<td>4</td>
</tr>
</tbody>
</table>

Defines the members by the joints to which they are connected.

MEMBER PROPERTY AMERICAN

<table>
<thead>
<tr>
<th>Joint number</th>
<th>Property</th>
<th>Section</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>TABLE</td>
<td>ST W8X18</td>
</tr>
<tr>
<td>2</td>
<td>TABLE</td>
<td>ST W12X26</td>
</tr>
</tbody>
</table>

Properties for all members are assigned from the American AISC steel table. The word ST stands for standard single section.

UNIT INCHES
DEFINE MATERIAL START

<th>Force</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>FX 5</td>
</tr>
</tbody>
</table>

A fixed force is applied at Joint 2 with a magnitude of 5.
Load 1 contains a joint load of 5 kips at node 2. FX indicates that the load is a force in the global X direction.

<table>
<thead>
<tr>
<th>MEMBER LOAD</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 UNI GY -3.0</td>
</tr>
</tbody>
</table>

Load 1 contains a member load also. GY indicates that the load is in the global Y direction. The word UNI stands for uniformly distributed load.

**PERFORM ANALYSIS**

This command instructs the program to proceed with the analysis.

**PRINT MEMBER FORCES**

The above PRINT command is self-explanatory.

*  
* FOLLOWING PRINT COMMAND WILL PRINT  
* DISPLACEMENTS OF THE MEMBERS  
* CONSIDERING EVERY TWELFTH INTERMEDIATE  
* POINT (THAT IS TOTAL OF 13 POINTS). THESE  
* DISPLACEMENTS ARE MEASURED IN GLOBAL X  
* Y Z COORDINATE SYSTEM AND THE VALUES  
* ARE FROM ORIGINAL COORDINATES (UNDEFORMED  
* POSITION) OF CORRESPONDING TWELFTH  
* POINTS.

**EX. US-14 P-Delta Analysis of a Frame Under Seismic Loads**

A space frame is analyzed for seismic loads. The seismic loads are generated using the procedures of the building code. A P-Delta analysis is performed to obtain the secondary effects of the lateral and vertical loads acting simultaneously.

This problem is installed with the program by default to

C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US\US-14 P-Delta Analysis of a Frame Under Seismic Loads.STD when you install the program.
Every input has to start with the term STAAD. The word SPACE signifies that the structure is a space frame.

UNIT FEET KIP

Defines the input units for the data that follows.

<table>
<thead>
<tr>
<th>JOINT COORDINATES</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 0 0 4 3 0 0 0</td>
</tr>
<tr>
<td>REPEAT 3 0 0 10</td>
</tr>
<tr>
<td>REPEAT ALL 3 0 10 0</td>
</tr>
</tbody>
</table>

The X, Y and Z coordinates of the joints are specified here. First, coordinates of joints 1 through 4 are generated by taking advantage of the fact that they are equally spaced. Then, this pattern is REPEATED 3 times with a Z increment of 3.5 m for each repetition to generate joints 5 to 16. The REPEAT ALL command will then repeat 3 times, the pattern of joints 1 to 16 to generate joints 17 to 64.

MEMBER INCIDENCES

* beams in x direction

| 101 17 18 103 |
| 104 21 22 106 |
| 107 25 26 109 |

REPEAT ALL 2 12 16
* beams in z direction
201 17 21 204
205 21 25 208
209 25 29 212
REPEAT ALL 2 12 16
* columns
301 1 17 348

Defines the members by the joints to which they are connected. Following the specification of incidences for members 101 to 112, the REPEAT ALL command is used to repeat the pattern and generate incidences for members 113 through 136. A similar logic is used in specification of incidences of members 201 through 212 and generation of incidences for members 213 to 236. Finally, members incidences of columns 301 to 348 are specified.

UNIT INCH
MEMBER PROPERTIES AMERICAN
101 TO 136 201 TO 236 PRIS YD 15 ZD 15
301 TO 348 TA ST W18X35

The beam members have prismatic member property specification (YD & ZD) while the columns (members 301 to 348) have their properties called from the built-in American (AISC) steel table.

The DEFINE MATERIAL command is used to specify material properties and the CONSTANT is used to assign the material to all members.

Tip: You may see these values with the help of the command PRINT MATERIAL PROPERTIES following the preceding commands.

SUPPORT
1 TO 16 FIXED
Indicates the joints where the supports are located as well as the type of support restraints.

UNIT FEET
DEFINE IBC 2012 LOAD
ZIP 92806 RX 9 RZ 9 I 1.0 TL 12.0 SCLASS 4 CT 0.032
SELFWEIGHT
JOINT WEIGHT
17 TO 48 WEIGHT 2.5
49 TO 64 WEIGHT 1.25

There are two stages in a static seismic load. The first stage is to define the code-specified load parameters along with the vertical loads (weights) from which the base shear will be calculated. The vertical loads may be specified in the form of selfweight, joint weights and/or member weights. Member weights are not shown in this example. It is important to note that these vertical loads are used purely in the determination of the horizontal base shear only. In other words, the structure is not analyzed for these vertical loads.

LOAD 1
IBC LOAD X 0.75
SELFWEIGHT Y -1.0
JOINT LOADS
17 TO 48 FY -2.5
49 TO 64 FY -1.25

This is the second stage in which the static seismic load is applied with the help of a load case number, corresponding direction (X in the above case) and a factor by which the generated horizontal loads should be multiplied. Along with the seismic lateral load, deadweight is also added to the same load case. Since we will be doing second-order (PDELTA) analysis, it is important that we include horizontal and vertical loads in the same load case.

LOAD 2
IBC LOAD Z 0.75
SELFWEIGHT Y -1.0
JOINT LOADS
17 TO 48 FY -2.5
49 TO 64 FY -1.25

In load case 2, the static seismic load is being applied in the Z direction. Vertical loads are part of this case, also.

PDELTA ANALYSIS PRINT LOAD DATA

We are requesting a second-order analysis by specifying the command PDELTA ANALYSIS. PRINT LOAD DATA is used to obtain a report of all the applied and generated loadings.

PRINT SUPPORT REACTIONS
FINISH

The above commands are self-explanatory.

EX. US-15 Wind and Floor Load Generation on a Space Frame

A space frame is analyzed for loads generated using the built-in wind and floor load generation facilities. This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US \US-15 Wind and Floor Load Generation on a Space Frame.STD when you install the program.

STAAD SPACE - WIND AND FLOOR LOAD GENERATION

This is a space frame analysis problem. Every STAAD input has to start with the command STAAD. The SPACE specification is used to denote a space (3D) frame.

UNIT FEET KIP

The UNIT specification is used to specify the length and/or force units to be used.

JOINT COORDINATES
1 0 0 0
2 10 0 0
3 21 0 0

Figure 521: Example Problem No. 15
The **JOINT COORDINATE** specification is used to specify the X, Y, and Z coordinates of the joints. Note that the **REPEAT ALL** command has been used to generate joints for the two upper stories each with a Y increment of 12 ft.

**MEMBER INCIDENCES**

* Columns

  32 17 20 ; 33 20 22 ; 34 18 21 ; 35 21 23 ; 36 19 24

The **MEMBER INCIDENCE** specification is used for specifying member connectivities.

**UNIT INCH**

**MEMBER PROPERTIES AMERICAN**

1 TO 16 TA ST W21X50
17 TO 26 TA ST W18X35
27 TO 36 TA ST W14X90

Properties for all members are specified from the built-in American (AISC) steel table. Three different sections have been used.

```
DEFINE MATERIAL START
ISOTROPIC STEEL
E 29000
POISSON 0.3
DENSITY 283e-006
ALPHA 6e-006
DAMP 0.03
TYPE STEEL
STRENGTH FY 36 FU 58 RY 1.5 RT 1.2
END DEFINE MATERIAL
CONSTANT
MATERIAL STEEL ALL
```

The **DEFINE MATERIAL** command is used to specify material properties and the **CONSTANT** is used to assign the material to all members.

**SUPPORT**

1 TO 8 FIXED BUT MX MZ

The supports of the structure are defined through the **SUPPORT** specification. Here all the supports are **FIXED** with releases specified in the **MX** (rotation about global X-axis) and **MZ** (rotation about global Z-axis) directions.

**UNIT FEET**

**DEFINE WIND LOAD**

**TYPE 1**
When a structure has to be analyzed for wind loading, the engineer is confronted with the task of first converting an abstract quantity like wind velocity or wind pressure into concentrated loads at joints, distributed loads on members, or pressure loads on plates. The large number of calculations involved in this conversion can be avoided by making use of STAAD’s wind load generation utility. This utility takes wind pressure at various heights as the input, and converts them to values that can then be used as concentrated forces known as joint loads in specific load cases. The input specification is done in two stages. The first stage is initiated above through the DEFINE WIND LOAD command. The basic parameters of the WIND loading are specified here. All values need to be provided in the current UNIT system. Each wind category is identified with a TYPE number (an identification mark) which is used later to specify load cases.

In this example, two different wind intensities (0.1 Kips/sq. ft and 0.15 Kips/sq. ft) are specified for two different height zones (0 to 12 ft. and 12 to 24 ft.). The EXPOSURE specification is used to mitigate or magnify the effect at specific nodes due to special considerations like openings in the structure. In this case, two different exposure factors are specified. The first EXPOSURE specification specifies the exposure factor as 0.9 for all joints within the height range (defined as global Y-range) of 11 ft. - 13 ft. The second EXPOSURE specification specifies the exposure factor as 0.85 for joints 17, 20 and 22. In the EXPOSURE factor specification, the joints may be specified directly or through a vertical range specification.

This is the second stage of input specification for the wind load generation. The term WIND LOAD and the direction term that follows are used to specify the wind loading in a particular lateral direction. In this case, WIND loading TYPE 1, defined previously, is being applied in the global X-direction with a positive multiplication factor of 1.2.

In load case 2 in this problem, a floor load generation is performed. In a floor load generation, a pressure load (force per unit area) is converted by the program into specific points forces and distributed forces on the members located in that region. The YRANGE, XRANGE, and ZRANGE specifications are used to define the area of the structure on which the pressure is acting. The FLOAD specification is used to specify the value of that pressure. All values need to be provided in the current UNIT system. For example, in the first line in the above FLOOR LOAD specification, the region is defined as being located within the bounds YRANGE of 11.9-12.1 ft, XRANGE of 0.0-10.0 ft and ZRANGE of 0.0-20.0 ft. The -0.45 signifies that the pressure is 0.45 Kip/sq. ft in the negative global Y direction.

The program will identify the members lying within the specified region and derive member loads on these members based on two-way load distribution.

We can view the values and position of the generated loads with the help of the PRINT LOAD DATA command used above along with the PERFORM ANALYSIS command.

Above commands are self-explanatory.

STAAD SPACE

SUPPORT REACTIONS -UNIT KIP FEET STRUCTURE TYPE = SPACE
### Application Examples

#### EX. American Design Examples

**EX. US-16 Time History Analysis for Forcing Function and Ground Motion**

Dynamic Analysis (Time History) is performed for a 3 span beam with concentrated and distributed masses. The structure is subjected to "forcing function" and "ground motion" loading. The maxima of joint displacements, member end forces and support reactions are determined.

This problem is installed with the program by default to
C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US\US-16 Time History Analysis for Forcing Function and Ground Motion.STD when you install the program.
Where:

$L_1 = 3.5$ ft

**STAAD PLANE EXAMPLE FOR TIME HISTORY ANALYSIS**

Every input file has to start with the word *STAAD*. The term *PLANE* signifies that the structure is a plane frame.

**UNITS FEET KIP**

Specifies the units to be used.

<table>
<thead>
<tr>

<td>4</td>
<td>0.0</td>
<td>10.5</td>
<td>0.0</td>
</tr>
</tbody>
</table>

Joint number followed by the X, Y and Z coordinates are specified above.

| MEMBER INCIDENCES | 1 1 2 3 |
Incidences of members 1 to 3 are specified above.

```plaintext
UNIT INCH
MEMBER PROPERTIES
1 2 3 PRIS AX 3.0 IZ 240.0
```

All the members have PRISMATIC property specification. Since this is a plane frame, Area of cross section (AX) and Moment of Inertia (IZ) about the Z axis are adequate for the analysis.

```plaintext
SUPPORTS
1 4 PINNED
```

Pinned supports are located at nodes 1 and 4.

```plaintext
DEFINE MATERIAL ISOTROPIC CONCRETE
E 14000
POISSON 0.17
DENSITY 8.7e-005
ALPHA 5e-006
DAMP 0.05
G 1346.15
TYPE CONCRETE
STRENGTH FCU 4
END DEFINE MATERIAL
CONSTANTS
MATERIAL CONCRETE ALL
```

The DEFINE MATERIAL command is used to specify material properties and the CONSTANT is used to assign the material to all members.

```plaintext
DEFINE TIME HISTORY TYPE 1 FORCE
0.0 -0.0001 0.5 0.2244 1.5 0.2244 2.0 0.6731 2.5 -0.6731
TYPE 2 ACCELERATION
0.0 0.001 0.5 -7.721 1.0 -38.61 1.5 -38.61 2.0 -115.82 2.5 115.82
ARRIVAL TIMES
0.0
DAMPING 0.075
```

There are two stages in the command specification required for a time history analysis. The first stage is defined above. First the characteristics of the time varying load are provided. The loading type may be a forcing function (vibrating machinery) or ground motion (earthquake). The former is input in the form of time-force pairs while the latter is in the form of time-acceleration pairs. Following this data, all possible arrival times for these loads on the structure as well as the modal damping ratio are specified. In this example, the damping ratio is the same (7.5%) for all modes.

```plaintext
UNIT FEET
LOAD 1 STATIC LOAD
MEMBER LOAD
1 2 3 UNI GX 0.5
```

Load case 1 above is a static load. A uniformly distributed force of 0.5 kip/ft acts along the global X direction on all 3 members.

```plaintext
LOAD 2 TIME HISTORY LOAD
SELFWEIGHT X 1.0
SELFWEIGHT Y 1.0
JOINT LOAD
2 3 FX 2.5
TIME LOAD
```
This is the second stage in the command specification for time history analysis. This involves the application of the time varying load on the structure. The masses that constitute the mass matrix of the structure are specified through the selfweight and joint load commands. The program will extract the lumped masses from these weights. Following that, both the TIME LOAD and GROUND MOTION are applied simultaneously.

Note: This example is only for illustration purposes and that it may be unlikely that a TIME LOAD and GROUND MOTION both act on the structure at the same time.

The Time load command is used to apply the Type 1 force, acting in the global X direction, at arrival time number 1, at nodes 2 and 3. The Ground motion, namely, the Type 2 time history loading, is also in the global X direction at arrival time 1.

The above command initiates the analysis process.

During the analysis, the program calculates joint displacements for every time step. The absolute maximum value of the displacement for every joint is then extracted from this joint displacement history. So, the value printed using the above command is the absolute maximum value for each of the six degrees of freedom at each node.

The member forces and support reactions too are calculated for every time step. For each degree of freedom, the maximum value of the member force and support reaction is extracted from these histories and reported in the output file using the above command.

EX. US-17 User-Provided Tables

The usage of user-provided steel tables is illustrated in this example for the analysis and design of a plane frame. User-provided tables allow you to specify property data for sections not found in the built-in steel section tables.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US \US-17 User-Provided Tables.STD when you install the program.
Figure 523: Example Problem No. 17

Where:

\[
L1 = 15 \text{ ft}, L2 = 20 \text{ ft} \\
P = 5.0 \text{ k} \\
w = 3.0 \text{ k/ft}
\]

Actual input is shown in bold lettering followed by explanation.

**STAAD PLANE EXAMPLE FOR USER TABLE**

Every input file has to start with the command STAAD. The PLANE command is used to designate the structure as a plane frame.

**UNIT FT KIP**
The UNIT command sets the length and force units to be used.

JOINT COORDINATES
1  0  0 ;  2  30  0 ;  3  0  20  0  6  30  20  0
7  0  35 ;  8  30  35 ;  9  7.5  35 ; 10  22.5  35.
11  15  35 ; 12  5.  38. ; 13  25  38 ; 14  10  41 ; 15  20  41
16  15  44

The above set of data is used to provide joint coordinates for the various joints of the structure. The Cartesian system is being used here. The data consists of the joint number followed by global X and Y coordinates. Note that for a space frame, the Z coordinate(s) need to be provided also.

Note: Semicolons (;) are used as line separators to allow for input of multiple sets of data on one line.

MEMBER INCIDENCES
1  1  3 ;  2  3  7 ;  3  2  6 ;  4  6  8 ;  5  3  4
6  4  5 ;  7  5  6 ;  8  7  12 ;  9  12  14
10 14 16 ; 11 15 16 ; 12 13 15 ; 13 8 13
14  9  12 ; 15  9  14 ; 16 11 14 ; 17 11 15
18 10 15 ; 19 10 13 ; 20  7  9
21  9  11 ; 22 10 11 ; 23  8  10

The above data set contains the member incidence information or the joint connectivity data for each member. This completes the geometry of the structure.

START USER TABLE

This command is utilized to set up a user-provided steel table. All user-provided steel tables must start with this command.

TABLE 1

Each table needs an unique numerical identification. The above command starts setting up Table no. 1. Up to twenty tables may be specified per run.

UNIT INCH
WIDE FLANGE

This command is used to specify the section-type as WIDE FLANGE in this table. Note that several section-types such as WIDE FLANGE, CHANNEL, ANGLE, TEE etc. are available for specification (see TR.19 User Steel Table Specification on page 2216).

WFL14X30
  8.85 13.84 .27 6.73 .385 291. 19.6 .38 4.0 4.1
WFL21X62
 18.3 20.99 .4 8.24 .615 1330 57.5 1.83 0.84 7.0
WFL14X109

The above data set is used to specify the properties of three wide flange sections. The data for each section consists of two parts. In the first line, the section-name is provided. You are allowed to provide any section name within twelve characters. The second line contains the section properties required for the particular section-type. Each section-type requires a certain number of data (area of cross-section, depth, moment of inertias etc.) provided in a certain order. For example, in this case, for wide flanges, ten different properties are required.

TABLE 2
ANGLES
LANG25255
 2.5 2.5 .3125 .489 0 0
LANG40404
 4 4 .25 .795 0 0
The above command and data lines set up another user provided table consisting of angle sections.

```
END
```

This command signifies the end of the user provided table data set. All user provided table related input must be terminated with this command.

</tbody>
</table>

In the above command lines, the member properties are being assigned from the user provided tables created earlier. The word UPT signifies that the properties are from the user-provided table. This is followed by the table number and then the section name as specified in the use-provided table. The numbers 1 or 2 following the word UPT indicate the table from which section names are fetched.

<table>
<thead>
<tr>
<th>MEMBER TRUSS</th>
</tr>
</thead>
<tbody>
<tr>
<td>14 TO 23</td>
</tr>
</tbody>
</table>

The above command is used to designate members 14 to 23 as truss members.

<table>
<thead>
<tr>
<th>MEMBER RELEASE</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 START MZ</td>
</tr>
</tbody>
</table>

The MEMBER RELEASE command is used to release the MZ moment at the start joint of member no. 5.

```
DEFINE MATERIAL START
ISOTROPIC STEEL
E 29000
POISSON 0.3
DENSITY 283e-006
ALPHA 6e-006
DAMP 0.03
TYPE STEEL
STRENGTH FY 36 FU 58 RY 1.5 RT 1.2
END DEFINE MATERIAL
CONSTANT
MATERIAL STEEL ALL
BETA 90.0 MEMB 3 4
```

The DEFINE MATERIAL command is used to specify material properties and the CONSTANT is used to assign the material to all members.

```
UNIT FT
```

The length unit is reset to feet using this command.

```
UNIT FT
```

The length unit is reset to feet using this command.

```
SUPPORT
1 FIXED ; 2 PINNED
```

The above command set is used to designate supports. Here, joint 1 is designated as a fixed support and joint 2 is designated as a pinned support.

```
LOADING 1 DEAD AND LIVE LOAD
SELFWEIGHT Y -1.0
JOINT LOAD
4 5 FY -15. ; 11 FY -35.
```
MEMB LOAD
8 TO 13 UNI Y -0.9 ; 6 UNI GY -1.2

The above command set is used to specify the loadings on the structure. In this case, dead and live loads are provided through load case 1. It consists of selfweight, concentrated loads at joints 4, 5 and 11, and distributed loads on some members.

PERFORM ANALYSIS

This command instructs the program to execute the analysis at this point.

PARAMETER

CODE AISC UNIFIED
BEAM 1.0 ALL
NSF 0.85 ALL
KY 1.2 MEMB 3 4

The above commands are used to specify parameters for steel design.

SELECT MEMBER 3 6 9 19

This command will perform selection of members per the AISC ASD steel design code. For each member, the member selection will be performed from the table that was originally used for the specification of the member property. In this case, the selection will be from the respective user tables from which the properties were initially assigned. It may be noted that properties may be provided (and selection may be performed) from built-in steel tables and user provided tables in the same data file.

FINISH

This command terminates a STAAD run.

EXAMPLE FOR USER TABLE

STAAD.PRO MEMBER SELECTION - AISC 360-16 LRFD (V1.2)

ALL UNITS ARE - KIP  FEET (UNLESS OTHERWISE Noted).

***NOTE : AISC 360-16 Design Statement for STAAD.Pro.

*** AXIS CONVENTION ***:

AXIS CONVENTION:

The capacity results and intermediate results in the report follow the notations and axes labels as defined in the AISC 360-16 code.
The analysis results are reported in STAAD.Pro axis convention and the AISC 360:16 design results are reported in AISC 360-16 code axis convention.

AISC Spec.      STAAD.Pro      Description
---------------  -----------      --------------
X               Z      Axis typically parallel to the sections principal
major axis.     Y      Axis typically parallel to the sections principal
minor axis.     Z      Longitudinal axis perpendicular to the cross section.

SECTION FORCES AXIS MAPPING:

Pz              FX      Axial force.
Vy              FY      Shear force along minor axis.
Vx              FZ      Shear force along major axis.
Tz              MX      Torsional moment.
My              MY      Bending moment about minor axis.
Mx              MZ      Bending moment about major axis.

*** DESIGN MESSAGES ***:
1. Section classification reported is for the cross section and loadcase that produced the worst case design ratio for flexure/compression Capacity results.
2. Results for any Capacity/Check that is not relevant for a section/loadcase based on the code clause in AISC 360-16 will not be shown in the report.
3. Bending results are reported as being about the relevant axis (X/Y), while the results for shear are reported as being for shear forces along the axis. E.g : Mx indicates bending about the X axis, while Vx indicates shear along the X axis.

*** ABBREVIATIONS ***:

F-T-B = Flexural-Torsional Buckling
L-T-B = Lateral-Torsional Buckling
F-L-B = Flange Local Buckling
W-L-B = Web Local Buckling
L-L-B = Leg Local Buckling
C-F-Y = Compression Flange Yielding
T-F-Y = Tension Flange Yielding

**WARNING** SOME MEMBER SIZES HAVE CHANGED SINCE LAST ANALYSIS.
EX. US-18 Stress Calculation for Plate Elements

This is an example which demonstrates the calculation of principal stresses on a finite element.

This problem is installed with the program by default to
C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US \US-18 Stress Calculation for Plate Elements.STD when you install the program.
Where:

L = 1 ft

Fixed Supports at Joints 1, 2, 3, 4, 5, 9, 13

Load intensity = 1 psi (pound/in^2) in negative global Y direction

Actual input is shown in bold lettering followed by explanation.

STAAD SPACE SAMPLE CALCULATION FOR
* ELEMENT STRESSES

Every input has to start with the term STAAD. The word SPACE signifies that the structure is a space frame (3-D structure).

UNIT KIP FEET

Defines the input units for the data that follows.

JOINT COORDINATES
1 0 0 4 3 0 0
REPEAT 3 0 0 1

Joint number followed by X, Y and Z coordinates are provided above. The REPEAT command is used to generate coordinates of joints 5 to 16 based on the pattern of joints 1 to 4.
Element connectivities of elements 1 to 3 are defined first, based on which, the connectivities of elements 4 to 9 are generated.

```
UNIT INCH
ELEMENT PROPERTIES
1 TO 9 THICK 1.0
```

Elements 1 to 9 have a thickness of 1.0 in.

```
DEFINE MATERIAL START
ISOTROPIC CONCRETE
E 3150
POISSON 0.17
DENSITY 8.7e-005
ALPHA 5e-006
DAMP 0.05
G 1346.15
TYPE CONCRETE
STRENGTH FCU 4
END DEFINE MATERIAL
CONSTANTS
MATERIAL CONCRETE ALL
```

The DEFINE MATERIAL command is used to specify material properties and the CONSTANT is used to assign the material to all members.

```
SUPPORT
1 TO 4 5 9 13 FIXED
```

Fixed support conditions exist at the above mentioned joints.

```
UNIT POUND
LOAD 1
ELEMENT LOAD
1 TO 9 PRESSURE -1.0
```

A uniform pressure of 1 pound/sq. in is applied on all the elements. In the absence of an explicit direction specification, the load is assumed to act along the local Z axis. The negative value indicates that the load acts opposite to the positive direction of the local Z.

```
PERFORM ANALYSIS
```

The above command instructs the program to proceed with the analysis.

```
PRINT SUPPORT REACTION
```

The above command is self-explanatory.

```
PRINT ELEMENT STRESSES LIST 4
```

Element stresses at the centroid of the element are printed using the above command. The output includes membrane stresses, shear stresses, bending moments per unit width and principal stresses.

```
FINISH
```

The STAAD run is terminated.

**Calculation of principal stresses for element 4**

Calculations are presented for the top surface only.

\[ SX = 0.0 \text{ lb/in}^2 \]
SY = 0.0 lb/in²
SXY = 0.0 lb/in²
MX = 16.90 lb/in
MY = 85.81 lb/in
MXY = 36.43 lb/in

S = 1/6t² = 1/6 · 1² = 0.1667 in³ (Section Modulus)

σₓ = SX + MX/S = 0.0 + 16.90/0.1667 = 101.38 psi
σᵧ = SY + MY/S = 0.0 + 85.81/0.1667 = 514.75 psi
τₓᵧ = SXY + MXY/S = 0.0 + 36.43/0.1667 = 218.54 psi

\[ T_{Max} = \sqrt{\left(\frac{\sigma_x - \sigma_y}{4}\right)^2 + \tau_{x,y}^2} = \sqrt{\left(\frac{(101.38 - 514.75)^2}{4}\right) + 218.54^2} = 300.80 \text{ psi} \]

\[ S_{Max} = (\sigma_x + \sigma_y)/2 + T_{Max} = (101.38 + 514.75)/2 + 300.80 = 608.87 \text{ psi} \]
\[ S_{Min} = (\sigma_x + \sigma_y)/2 \cdot T_{Max} = (101.38 + 514.75)/2 \cdot 300.80 = 7.27 \text{ psi} \]

\[ \text{Angle} = \frac{1}{2} \tan^{-1}\left(\frac{2\tau_{x,y}}{\sigma_x - \sigma_y}\right) = \frac{1}{2} \tan^{-1}\left(\frac{2(218.54)}{101.38 - 514.75}\right) = -23.30° \]

\[ VON = 0.707 \sqrt{(S_{Max} - S_{Min})^2 + S_{Max}^2 + S_{Min}^2} = 0.707 \sqrt{(608.87 - 7.27)^2 + 608.87^2 + 7.27^2} = 605.18 \text{ psi} \]

EX. US-19 Inclined Supports

This example demonstrates the usage of inclined supports. The word INCLINED refers to the fact that the restraints at a joint where such a support is specified are along a user-specified axis system instead of along the default directions of the global axis system. STAAD.Pro offers a few different methods for assigning inclined supports, and we examine those in this example.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US\US-19 Inclined Supports.STD when you install the program.

![Figure 525: Example Problem No. 19](image)

Actual input is shown in bold lettering followed by explanation.

```
STAAD SPACE
INPUT WIDTH 79

UNIT METER KN

JOINT COORDINATES
1 0 5 0; 2 10 5 10; 3 20 5 20; 4 30 5 30; 5 5 0 5; 6 25 0 25;

Note: Semicolons (;) are used as line separators to allow for input of multiple sets of data on one line.

MEMBER INCIDENCES
1 1 2; 2 2 3; 3 3 4; 4 5 2; 5 6 3;

UNIT MMS KN
MEMBER PROPERTY AMERICAN
4 5 PRIS YD 800
1 TO 3 PRIS YD 750 ZD 500
```
Properties for all members of the model are provided using the PRISMATIC option (abbreviated to PRIS here). YD and ZD stand for depth and width. If ZD is not provided, a circular shape with diameter = YD is assumed for that cross section. All properties required for the analysis, such as, Area, Moments of Inertia, etc. are calculated automatically from these dimensions unless these are explicitly defined. The values are provided in MMS unit.

  5 INCLINED REF 10 5 10 FIXED BUT MX MY MZ KFX 30000
  6 INCLINED REFJT 3 FIXED BUT MX MY MZ KFX 30000
  1 PINNED
  4 INCLINED 1 0 1 FIXED BUT FX MX MY MZ
```

We assign supports (restraints) at 4 nodes - 5, 6, 1 and 4. For 3 of those, namely, 5, 6 and 4, the node number is followed by the keyword INCLINED, signifying that an INCLINED support is defined there. For the remaining one - node 1 - that keyword is missing. Hence, the support at node 1 is a global direction support.

The most important aspect of inclined supports is their axis system. Each node where an inclined support is defined has its own distinct local X, local Y and local Z axes. In order to define the axis system, we first have to define a datum point. The support node and the datum point together help define the axis system.

Three different methods are shown in the above 3 instances for defining the datum point.

- At node 5, notice the keyword REF followed by the numbers (10,5,10). This means that the datum point associated with node 5 is one which has the global coordinates of (10m, 5m, 10m). Coincidentally, this happens to be node 2.
- At node 6, the keyword REFJT is used followed by the number 3. This means that the datum point for support node 6 is the joint number 3 of the model. The coordinates of the datum point are hence those of node 3, namely, (20m, 5m and 20m).
- At node 4, the word INCLINED is merely followed by 3 numbers (1,0,1). In the absence of the words REF and REFJT, the program sets the datum point to be the following. It takes the coordinates of node 4, which are (30m,5m,30m) and adds to them, the 3 numbers which comes after the word INCLINED. Thus, the datum point becomes (31m, 5m and 31m).

Once the datum point is established, the local axis system is defined as follows. Local X is a straight line (vector) pointing from the support node towards the datum point. Local Z is the vector obtained by the cross product of local X and the global Y axis (unless the SET Z UP command is used in which case one would use global Z instead of global Y and that would yield local Y). Local Y is the vector resulting from the cross product of local Z and local X. The right hand rule must be used when performing these cross products.
Notice the unique nature of these datum points. The one for node 5 tells us that a line connecting nodes 5 to 2 is the local X axis, and is hence along the axis of member 4. By defining a KFX spring at that one, we are saying that the lower end of member 4 can move along its axis like the piston of a car engine. Think of a pile bored into rock with a certain amount of freedom to expand and contract axially.

The same is true for the support at the bottom of member 5. The local X axis of that support is along the axis of member 5. That also happens to be the case for the supported end of member 3. The line going from node 4 to the datum point (31,5,31) happens to be coincident with the axis of the member, or the traffic direction. The expression FIXED BUT FX MX MY MZ for that support indicates that it is free to translate along local X, suggesting that it is an expansion joint - free to expand or contract along the axis of member 3.

Since MX, MY, and MZ are all released at these supports, no moment will be resisted by these supports.

| LOAD 1 DEAD LOAD |
| SELFWEIGHT Y -1.2 |
| LOAD 2 LIVE LOAD |
| MEMBER LOAD |
| 1 TO 3 UNI GY -6 |
| LOAD COMB 3 |
| 1 1 0 2 1 0 |
| PERFORM ANALYSIS PRINT STATICS CHECK |

Three load cases followed by the instruction for the type of analysis are specified. The PRINT STATICS CHECK option will instruct the program to produce a report consisting of total applied load versus total reactions from the supports for each primary load case.

| PRINT SUPPORT REACTION |

By default, support reactions are printed in the global axis directions. The above command is an instruction for such a report.

| SET INCLINED REACTION |
| PRINT SUPPORT REACTION |

Just earlier, we saw how to obtain support reactions in the global axis system. What if we need them in the inclined axis system? The “SET INCLINED REACTION” is a switch for that purpose. It tells the program that reactions should be reported in the inclined axis system instead of the global axis system. This has to be followed by the PRINT SUPPORT REACTIONS command.

| PRINT MEMBER FORCES |
| PRINT JOINT DISP |
| FINISH |

Member forces are reported in the local axis system of the members. Joint displacements at all joints are reported in the global axis system. Following this, the STAAD run is terminated.

### EX. US-20 Generating a Structure in Cylindrical Coordinates

This example generates the geometry of a cylindrical tank structure using the cylindrical coordinate system. The tank lies on its side in this example.
This problem is installed with the program by default to 
C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US \US-20 Generating a Structure in Cylindrical Coordinates.STD when you install the program.

![Diagram of a cylindrical tank with joints labeled from 1 to 24.](image)

**Figure 526: Example Problem No. 20**

In this example, a cylindrical tank is modeled using finite elements. The radial direction is in the XY plane and longitudinal direction is along the Z-axis. Hence, the coordinates in the XY plane are generated using the cylindrical coordinate system.

<table>
<thead>
<tr>
<th>STAAD SPACE</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNIT KIP FEET</td>
</tr>
</tbody>
</table>

The type of structure (space frame) and length and force units for data to follow are specified.

<table>
<thead>
<tr>
<th>JOINT COORD CYLINDRICAL</th>
</tr>
</thead>
</table>

The above command instructs the program that the coordinate data that follows is in the cylindrical coordinate system (r,theta,z).

1 10 0 8 10 315 0

Joint 1 has an 'r' of 10 feet, theta of 0 degrees and Z of 0 ft. Joint 8 has an 'r' of 10 feet, theta of 315 degrees and Z of 0 ft. The 315 degrees angle is measured counter-clockwise from the +ve direction of the X-axis. Joints 2 to 7 are generated by equal increments of the coordinate values between joints 1 and 8.

| REPEAT 2 0 0 8.5 |

The REPEAT command is used to generate joints 9 through 24 by repeating twice, the pattern of joints 1 to 8 at Z-increments of 8.5 ft for each REPEAT.

| PRINT JOINT COORD |
The above command is used to produce a report consisting of the coordinates of all the joints in the Cartesian coordinate system. Note that even though the input data was in the cylindrical coordinate system, the output is in the Cartesian coordinate system.

```
ELEMENT INCIDENCES
  1 2 10 9 TO 7 1 1
  8 8 1 9 16
REPEAT ALL 1 8 8
```

The above 4 lines identify the element incidences of all 16 elements. Incidences of element 1 is defined as 1 2 10 9. Incidences of element 2 is generated by incrementing the joint numbers of element 1 by 1, incidences of element 3 is generated by incrementing the incidences of element 2 by 1 and so on up to element 7. Incidences of element 8 has been defined above as 8 1 9 16. The REPEAT ALL command states that the pattern of all the elements defined by the previous 2 lines, namely elements 1 to 8, must be repeated once with an element number increment of 8 and a joint number increment of 8 to generate elements 9 through 16.

```
PRINT ELEMENT INFO
```

The above command is self-explanatory.

```
FINISH
```

EX. US-21 Analysis of a Structure with Tension-Only Members

This example illustrates the modeling of tension-only members using the MEMBER TENSION command.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US \US-21 Analysis of a Structure with Tension-Only Members.STD when you install the program.
It is important to note that the analysis can be done for only 1 load case at a time. This is because, the set of “active” members (and hence the stiffness matrix) is load case dependent.

\[ \begin{align*}
L &= 15 \text{ ft}, \quad H = 10 \text{ ft} \\
\text{Load case 1: } P_1 &= 10 \text{ kips} & P_2 &= 15 \text{ kips} \\
\text{Load case 2: } P_3 &= -10 \text{ kips} & P_4 &= -15 \text{ kips}
\end{align*} \]

**STAAD PLANE EXAMPLE FOR TENSION-ONLY MEMBERS**

The input data is initiated with the word STAAD. This structure is a PLANE frame.

**UNIT FEET KIP**

Units for the commands to follow are defined above.

**JOINT COORDINATES**

<table>
<thead>
<tr>
<th>Joint</th>
<th>X (ft)</th>
<th>Y (ft)</th>
<th>Z (ft)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>

<td>0</td>
<td>20</td>
<td>0</td>
</tr>
<tr>
<td>4</td>
<td>15</td>
<td>20</td>
<td>0</td>
</tr>
<tr>
<td>5</td>
<td>15</td>
<td>10</td>
<td>0</td>
</tr>
<tr>
<td>6</td>
<td>15</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

*Figure 527: Example Problem No. 21*
Joint coordinates of joints 1 to 6 are defined above.

```
MEMBER INCIDENCES
  1 1 2 5
  6 1 5 ; 7 2 6 ; 8 2 4 ; 9 3 5 ; 10 2 5
```

Incidences of members 1 to 10 are defined.

```
MEMBER TENSION
  6 TO 9
```

Members 6 to 9 are defined as tension-only members using the MEMBER TENSION command. Hence for each load case, if during the analysis, any of the members 6 to 9 is found to be carrying a compressive force, it is disabled from the structure and the analysis is carried out again with the modified structure.

```
MEMBER PROPERTY AMERICAN
  1 TO 10 TA ST W12X26
```

All members have been assigned a WIDE FLANGE section from the built in American table.

```
UNIT INCH
DEFINE MATERIAL START

  DAMP 0.03
  TYPE STEEL
  STRENGTH FY 36 FU 58 RY 1.5 RT 1.2
END DEFINE MATERIAL
CONSTANT
  MATERIAL STEEL ALL
```

The DEFINE MATERIAL command is used to specify material properties and the CONSTANT is used to assign the material to all members. The length units have been changed from feet to inch to facilitate the input of these values.

```
SUPPORT
  1 6 PINNED
```

The supports are defined above.

```
MEMBER TENSION
  6 TO 9
```

One or more among the members 6 to 9 may have been inactivated in the analysis.

```
LOAD 1
  JOINT LOAD
  2 FX 15
  3 FX 10
```

Load 1 is defined above and consists of joint loads at joints 2 and 3.
Load case 2 is described above.

```
LOAD 3
REPEAT LOAD
  1 1.0 2 1.0
```

Load case 3 illustrates the technique employed to instruct STAAD to create a load case which consists of data to be assembled from other load cases already specified earlier. We would like the program to analyze the structure for loads from cases 1 and 2 acting simultaneously.

```
PRINT ANALYSIS RESULTS
FINI
```

The analysis results are printed and the run terminated.

### EX. US-22 Time History Analysis for Sinusoidal Loading

A space frame structure is subjected to a sinusoidal (dynamic) loading. The commands necessary to describe the sine function are demonstrated in this example. Time History analysis is performed on this model.

This problem is installed with the program by default to `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US\US-22 Time History Analysis for Sinusoidal Loading.STD` when you install the program.

*************** END OF LATEST ANALYSIS RESULT ***************
Every STAAD input file has to begin with the word STAAD.

The word SPACE signifies that the structure is a space frame and the geometry is defined through X, Y, and Z axes. The comment line which begins with an asterisk is an optional title to identify this project.

UNIT KIP FEET

The units for the data that follows are specified above.

Joint Coordinates

1 0 0 0 ; 2 15 0 0 ; 3 15 0 15 ; 4 0 0 15
5 0 20 0 ; 6 7.5 20 0 ; 7 15 20 0 ; 8 15 20 7.5
9 15 20 15 ; 10 7.5 20 15 ; 11 0 20 15
12 0 20 7.5

The joint number followed by the X, Y and Z coordinates are specified above.

Note: Semicolons (;) are used as line separators to allow for input of multiple sets of data on one line.

Member Incidences

1 1 5 ; 2 2 7 ; 3 3 9 ; 4 4 11 ; 5 5 6 ; 6 6 7
7 7 8 ; 8 8 9 ; 9 9 10 ; 10 10 11 ; 11 11 12 ; 12 12 5
13 6 13 ; 14 13 10 ; 15 8 13 ; 16 13 12

The members are defined by the joints to which they are connected.
Members 1 to 12 are defined as PRISmatic sections with width and depth values of 12 inches. The UNIT command is specified to change the units for input from FEET to INCHes.

<table>
<thead>
<tr>
<th>SUPPORTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 TO 4 PINNED</td>
</tr>
</tbody>
</table>

Joints 1 to 4 are declared to be pinned-supported.

</tbody>
</table>

There are two stages in the command specification required for a time-history analysis. The first stage is defined above. Here, the parameters of the sinusoidal loading are provided.

Each data set is individually identified by the number that follows the TYPE command. In this file, only one data set is defined, which is apparent from the fact that only one TYPE is defined.

The word FORCE that follows the TYPE 1 command signifies that this data set is for a forcing function. (If you want to specify an earthquake motion, an ACCELERATION may be specified.)

The command FUNCTION SINE indicates that instead of providing the data set as discrete TIME-FORCE pairs, a sinusoidal function, which describes the variation of force with time, is provided.

The parameters of the sine function, such as FREQUENCY, AMPLITUDE, and number of CYCLES of application are then defined. STAAD internally generates discrete TIME-FORCE pairs of data from the sine function in steps of time defined by the default value (refer to TR.31.4 Definition of Time History Load (on page 2416) for more information). The arrival time value indicates the relative value of time at which the force begins to act upon the structure. The modal damping ratio for all the modes is set to 0.075.

<table>
<thead>
<tr>
<th>LOAD 1 STATIC LOAD CASE</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER LOAD</td>
</tr>
<tr>
<td>5 6 7 8 9 10 11 12 UNI GY -1.0</td>
</tr>
</tbody>
</table>

The above data describe a static load case.

<table>
<thead>
<tr>
<th>LOAD 2 DYNAMIC LOAD CASE</th>
</tr>
</thead>
<tbody>
<tr>
<td>SELFWEIGHT X 1.0</td>
</tr>
</tbody>
</table>
This is the second stage of command specification for time history analysis. The two sets of data specified here are:

a. the weights for generation of the mass matrix  
b. the application of the time varying loads on the structure.

The weights (from which the masses for the mass matrix are obtained) are specified in the form of selfweight and joint loads.

Following that, the sinusoidal force is applied using the \texttt{TIME LOAD} command. The forcing function described by the \texttt{TYPE 1} load is applied on joints 8 and 12 and it starts to act starting at a time defined by the 1st arrival time number.

\begin{verbatim}
PERFORM ANALYSIS
PRINT ANALYSIS RESULTS
FINI
\end{verbatim}

The above commands are self explanatory. The \texttt{FINISH} command terminates the STAAD run.

EX. US-23 Spring Support Generation for a Slab on Grade

This example illustrates the usage of commands necessary to automatically generate spring supports for a slab on grade. The slab is subjected to pressure loading and analysis of the structure is performed.

This problem is installed with the program by default to
C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US \US-23 Spring Support Generation for a Slab on Grade.STD when you install the program.
where:

\[ H = 129', h_1 = 8'-6'', h_2 = 8', h_3 = 6' \]
\[ V = 40', v_1 = 6'-6'', v_2 = 6', v_3 = 7'-10'', v_4 = 4' \]

STAAD SPACE SLAB ON GRADE

Every STAAD input file has to begin with the word STAAD. The word SPACE signifies that the structure is a space frame and the geometry is defined through X, Y, and Z axes. The remainder of the words form a title to identify this project.

UNIT FEET KIP

The units for the data that follows are specified above.

For joints 1 through 7, the joint number followed by the X, Y, and Z coordinates are specified above. The coordinates of these joints is used as a basis for generating 21 more joints by incrementing the X coordinate of each of these seven joints by 8.5 feet, three times REPEAT commands are used to generate the remaining joints of the structure. The results of the generation may be visually verified using the STAAD graphical viewing facilities.
The incidences of element number 1 is defined and that data is used as a basis for generating the 2nd through the 6th element. The incidence pattern of the first six elements is then used to generate the incidences of 96 (= 16 x 6) more elements using the REPEAT command.

UNIT INCH
ELEMENT PROPERTIES
1 TO 102 TH 5.5

The thickness of elements 1 to 102 is specified as 5.5 inches following the command ELEMENT PROPERTIES.

The DEFINE MATERIAL command is used to specify material properties and the CONSTANT is used to assign the material to all members.

SUPPORTS
1 TO 126 ELASTIC MAT DIRECTION Y SUB 10.0

The above command is used to instruct STAAD to generate supports with springs which are effective in the global Y direction. These springs are located at nodes 1 to 126. The subgrade modulus of the soil is specified as 10 kip/cu.ft. The program will determine the area under the influence of each joint and multiply the influence area by the subgrade reaction to arrive at the spring stiffness for the FY degree of freedom at the joint. See TR. 27.3 Automatic Spring Support Generator for Foundations (on page 2294).

PRINT SUPP INFO

This command will enable us to obtain the details of the support conditions which were generated using the earlier commands.

LOAD 1 WEIGHT OF MAT & EARTH
ELEMENT LOAD
1 TO 102 PR GY -1.55

The above data describe a static load case. A pressure load of 1.55 kip/sq.ft acting in the negative global Y direction is applied on all the 102 elements.

LOAD 2 'COLUMN LOAD-DL+LL'
JOINT LOADS
1 2 FY -217.
8 9 FY -109.
5 FY -308.7
6 FY -617.4
22 23 FY -410.
29 30 FY -285.
26 FY -542.7
27 FY -1085.4
43 44 50 51 71 72 78 79 FY -307.5
47 54 82 FY -264.2
Load case 2 consists of several joint loads acting in the negative global Y direction.

A load combination case, identified with load case number 101, is specified above. It instructs STAAD to factor loads 1 and 2 by a value of 1.0 and then algebraically add the results.

The analysis is initiated using the above command.

Joint displacements for joints 33 and 56, and element stresses for elements 34 and 67, for load case 101, is obtained with the help of the above commands.

The STAAD run is terminated.

## EX. US-24 Analysis of a Concrete Block Using Solid Elements

This is an example of the analysis of a structure modeled using solid finite elements. This example also illustrates the method for applying an enforced displacement on the structure.
This problem is installed with the program by default to
C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US \US-24 Analysis of a Concrete Block Using Solid Elements.STD when you install the program.

Figure 530: Example Problem No. 24

STAAD SPACE
*EXAMPLE PROBLEM USING SOLID ELEMENTS

Every STAAD input file has to begin with the word STAAD. The word SPACE signifies that the structure is a space frame and the geometry is defined through X, Y, and Z axes. The comment line which begins with an asterisk is an optional title to identify this project.

UNIT KNS MET

The units for the data that follows are specified above.

<table>
<thead>
<tr>
<th>JOINT COORDINATES</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>
The joint number followed by the X, Y, and Z coordinates are specified above. The coordinates of some of those nodes are generated utilizing the fact that they are equally spaced between the extremities.

The incidences of solid elements are defined above. The word SOLID is used to signify that these are 8-node solid elements as opposed to 3-noded or 4-noded plate elements. Each line contains the data for generating 3 elements. For example, element number 1 is first defined by all of its 8 nodes. Then, increments of 1 to the joint number and 1 to the element number (the defaults) are used for generating incidences for elements 2 and 3. Similarly, incidences of elements 4, 7 and 10 are defined while those of 5, 6, 8, 9, 11 and 12 are generated.

UNIT METERL

The DEFINE MATERIAL command is used to specify material properties and the CONSTANT is used to assign the material to all members.

PRINT ELEMENT INFO SOLID LIST 1 TO 5

This command will enable us to obtain, in a tabular form, the details of the incidences and material property values of elements 1 to 5.

SUPPORTS
1 5 21 25 29 41 45 49 PINNED
9 ENFORCED

The above lines contain the data for supports for the model. The ENFORCED support condition is used to declare a point at which an enforced displacement load is applied later (see load case 3).

LOAD 1
SELF Y -1.0
JOINT LOAD
28 FY -1000.0

The above data describe a static load case. It consists of selfweight loading and a joint load, both in the negative global Y direction.

LOAD 2
JOINT LOADS
2 TO 4 22 TO 24 42 TO 44 FX 100.0

Load case 2 consists of several joint loads acting in the positive global X direction.

LOAD 3
SUPPORT DISPLACEMENT
9 FX 0.0011
Load case 3 consists of an enforced displacement along the global X direction at node 9. The displacement in the other enforced support degrees of freedom will default to zero.

```
UNIT POUND FEET
LOAD 4
ELEMENT LOAD SOLIDS
  3 6 9 12 FACE 4 PRE GY -500.0
```

In Load case 4, a pressure load of 500 pounds/sq.ft is applied on Face # 4 of solid elements 3, 6, 9 and 12. Face 4 is defined as shown in the following table:

<table>
<thead>
<tr>
<th>Face Number</th>
<th>Surface Joints</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>f1</td>
</tr>
<tr>
<td>1 front</td>
<td>Jt 1</td>
</tr>
<tr>
<td>2 bottom</td>
<td>Jt 1</td>
</tr>
<tr>
<td>3 left</td>
<td>Jt 1</td>
</tr>
<tr>
<td>4 top</td>
<td>Jt 4</td>
</tr>
<tr>
<td>5 right</td>
<td>Jt 2</td>
</tr>
<tr>
<td>6 back</td>
<td>Jt 5</td>
</tr>
</tbody>
</table>

The above table, and other details of this type of loading can be found in TR.32.3.2 Element Load Specification - Solids (on page 2447).

```
UNIT KNS MMS
LOAD 5
REPEAT LOAD
  1 1.0 2 1.0 3 1.0 4 1.0
```

Load case 5 illustrates the technique employed to instruct STAAD to create a load case which consists of data to be assembled from other load cases already specified earlier. We want the program to analyze the structure for loads from cases 1 through 4 acting simultaneously. In other words, the above instruction is the same as the following:

```
LOAD 5
SELF Y -1.0
JOINT LOAD
  28 FY -1000.0
  2 TO 4 22 TO 24 42 TO 44 FX 100.0
SUPPORT DISPLACEMENT
  9 FX .0011
ELEMENT LOAD SOLIDS
  3 6 9 12 FACE 4 PRE GY -500.0
LOAD COMB 10
  1 1.0 2 1.0
```

Load case 10 is a combination load case, which combines the effects of cases 1 & 2. While the syntax of this might look very similar to that of the REPEAT LOAD case shown in case 5, there is a fundamental difference. In a REPEAT LOAD case, the program computes the displacements by multiplying the inverted stiffness matrix by the
load vector built for the REPEAT LOAD case. But in solving load combination cases, the program merely calculates the end results (displacements, forces, reactions) by gathering up the corresponding values from the individual components of the combination case, factoring them, and then algebraically summing them up. This difference in approach is quite important in that non-linear problems such as PDELTA ANALYSIS, MEMBER TENSION, and MEMBER COMPRESSION situations, changes in support conditions etc. should be handled using REPEAT LOAD cases, not load combination cases.

PERFORM ANALYSIS PRINT STATICS CHECK

A static equilibrium report, consisting of total applied loading and total support reactions from each primary load case is requested along with the instructions to carry out a linear static analysis.

PRINT JOINT DISPLACEMENTS LIST 8 9

Global displacements at nodes 8 and 9 are obtained using the above command.

UNIT KNS METER
PRINT SUPPORT REACTIONS

Reactions at the supports are obtained using the above command.

UNIT NEWTON MMS
PRINT ELEMENT JOINT STRESS SOLID LIST 4 6

This command requests the program to provide the element stress results at the nodes of elements 4 and 6. The results will be printed for all the load cases. The word SOLID is used to signify that these are solid elements as opposed to plate or shell elements.

FINISH

The STAAD run is terminated.

**EX. US-25 Analysis of a Structure with Compression-Only Members**

This example demonstrates the usage of compression-only members. Since the structural condition is load dependent, the PERFORM ANALYSIS command is specified once for each primary load case.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US\US-25 Analysis of a Structure with Compression-Only Members.STD when you install the program.
This example has been created to illustrate the command specification for a structure with certain members capable of carrying compressive force only. It is important to note that the analysis can be done for only 1 load case at a time. This is because, the set of "active" members (and hence the stiffness matrix) is load case dependent.

where:

\[
L = 15 \text{ ft}, \quad H = 10 \text{ ft}
\]

Load case 1: \( P_1 = 10 \text{ kips} \) & \( P_2 = 15 \text{ kips} \)
Load case 2: \( P_3 = -10 \text{ kips} \) & \( P_4 = -15 \text{ kips} \)

**STAAD PLANE**

* EXAMPLE FOR COMPRESSION-ONLY MEMBERS

The input data is initiated with the word STAAD. This structure is a PLANE frame. The second line is an optional comment line.

**UNIT FEET KIP**

Units for the commands to follow are specified above.

**JOINT COORDINATES**

<table>
<thead>
<tr>
<th>Joint</th>
<th>X (feet)</th>
<th>Y (feet)</th>
</tr>
</thead>
<tbody>
<tr>

</table>

---

*Figure 531: Example Problem No. 25*
Joint coordinates of joints 1 to 6 are defined above.

<table>
<thead>
<tr>
<th>MEMBER INCIDENCES</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 1 2 5 ; 6 1 5 ; 7 2 6 ; 8 2 4 ; 9 3 5 ; 10 2 5</td>
</tr>
</tbody>
</table>

The members 1 to 10 are defined along with the joints to which they are connected.

<table>
<thead>
<tr>
<th>MEMBER COMPRESSION</th>
</tr>
</thead>
<tbody>
<tr>
<td>6 TO 9</td>
</tr>
</tbody>
</table>

Members 6 to 9 are defined as COMPRESSION-only members. Hence for each load case, if during the analysis, any of the members 6 to 9 is found to be carrying a tensile force, it is disabled from the structure and the analysis is carried out again with the modified structure.

<table>
<thead>
<tr>
<th>MEMBER PROPERTY AMERICAN</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 TO 10 TA ST W12X26</td>
</tr>
</tbody>
</table>

Properties for members 1 to 10 are defined as the STandard W12X26 section from the American AISC steel table.

<table>
<thead>
<tr>
<th>MEMBER PROPERTY BRITISH</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 TO 10 TA ST UC152X152X30</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>DEFINE MATERIAL START</th>
</tr>

</tr>
<tr>
<td>STRENGTH FY 36 FU 58 RY 1.5 RT 1.2</td>
</tr>
<tr>
<td>END DEFINE MATERIAL</td>
</tr>
</tbody>
</table>

The DEFINE MATERIAL command is used to specify material properties and the CONSTANT is used to assign the material to all members.

<table>
<thead>
<tr>
<th>SUPPORT</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 6 PINNED</td>
</tr>
</tbody>
</table>

Joints 1 and 6 are declared as pinned-supported.

<table>
<thead>
<tr>
<th>LOAD 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>JOINT LOAD</td>
</tr>
<tr>
<td>2 FX 15</td>
</tr>
<tr>
<td>3 FX 10</td>
</tr>
</tbody>
</table>

Load 1 is defined above and consists of joint loads in the global X direction at joints 2 and 3.

<table>
<thead>
<tr>
<th>PERFORM ANALYSIS</th>
</tr>
</thead>
</table>

The above structure is analyzed for load case 1.

<table>
<thead>
<tr>
<th>CHANGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER COMPRESSION</td>
</tr>
<tr>
<td>6 TO 9</td>
</tr>
</tbody>
</table>

One or more among the members 6 to 9 may have been in-activated in the previous analysis. The CHANGE command restores the original structure to prepare it for the analysis for the next primary load case. The members with the compression-only attribute are specified again.

<table>
<thead>
<tr>
<th>LOAD 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>JOINT LOAD</td>
</tr>
</tbody>
</table>
In load case 2, joint loads are applied in the negative global X direction at joints 4 and 5.

The instruction to analyze the structure is specified again. Next, any compression-only members that were inactivated during the second analysis (due to the fact that they were subjected to tensile axial forces) are re-activated with the CHANGE command. Without the re-activation, these members cannot be accessed for further processing.

Load case 3 illustrates the technique employed to instruct STAAD to create a load case which consists of data to be assembled from other load cases already specified earlier. We would like the program to analyze the structure for loads from cases 1 and 2 acting simultaneously. In other words, the above instruction is the same as the following:

The analysis is carried out for load case 3.

The members inactivated during the analysis of load case 3 are re-activated for further processing.

At the end of any analysis, only those load cases for which the analysis was done most recently, are recognized as the “active” load cases. The LOAD LIST ALL command enables all the load cases in the structure to be made active for further processing.

The program is instructed to write the joint displacements, support reactions and member forces to the output file.

The STAAD run is terminated.

EXAMPLE FOR COMPRESSION-ONLY MEMBERS

*************** END OF THE STAAD.Pro RUN ***************
**** DATE= JAN 3,2022  TIME= 14:52:42 ****
EX. US-26 Modeling a Rigid Diaphragm Using Control-Dependent

The structure in this example is a building consisting of member columns as well as floors made up of beam members and plate elements. Using the control-dependent command, the floors are specified to be rigid diaphragms for in-plane actions but flexible for bending actions.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US \US-26 Modeling a Rigid Diaphragm Using Control-Dependent.STD when you install the program.
Every STAAD input file has to begin with the word STAAD. The word SPACE signifies that the structure is a space frame and the geometry is defined through X, Y and Z axes. The second line is an optional title to identify this project.

UNITS KIP FT

Specify units for the following data.

JOINT COORD
1 0 0 0 4 0 48 0
REPEAT 3 24 0 0
REPEAT ALL 3 0 0 24
DELETE JOINT 21 25 37 41

The joint numbers and coordinates are specified above. The unwanted joints, created during the generation process used above, are then deleted.

The ELEMENT INCIDENCE specification is used for specifying plate element connectivities.

MEMBER PROPERTIES AMERICAN
1 TO 15 22 TO 27 34 TO 48 TA ST W14X90
49 TO 120 TABLE ST W27X84

Tip: The elements are not what provides the diaphragm action for this model. Rather, the control-dependent node relationships defined later in the model dictate that interaction.

All members are WIDE FLANGE sections whose properties are obtained from the built in American steel table.

ELEMENT PROP
152 TO 178 THICK 0.75

The thickness of the plate elements is specified above.

UNIT INCHES
DEFINE MATERIAL START
The `DEFINE MATERIAL` command is used to specify material properties and the `CONSTANT` is used to assign the material to all members. The orientation of some of the members is set using the `BETA` angle command.

The supports at the above mentioned joints are declared as fixed.

The three floors of the structure are specified to act as rigid diaphragms in the ZX plane with the corresponding control joint specified. The associated dependent joints in a floor are specified by the `YRANGE` parameter. The floors may still resist out-of-plane bending actions flexibly.

The above data describe a static load case. It consists of joint loads in the global Z direction.
The above data describe a static load case. It consists of joint loads that create a torsional loading on the structure.

LOADING 3 DEAD LOAD
ELEMENT LOAD
152 TO 178 PRESS GY -1.0

The above data describe a static load case. It consists of plate element pressure on a floor in the negative global Y direction.

PERFORM ANALYSIS

The above command instructs the program to proceed with the analysis.

PRINT JOINT DISP LIST 4 TO 60 BY 8
PRINT MEMBER FORCES LIST 116 115
PRINT SUPPORT REACTIONS LIST 9 57

Print displacements at selected joints, then print member forces for two members, then print support reactions at selected joints.

FINISH

The STAAD run is terminated.

EX. US-27 Modeling Soil Springs for a Slab on Grade

This example illustrates the usage of commands necessary to apply the compression only attribute to spring supports for a slab on grade. The spring supports themselves are generated utilizing the built-in support generation facility. The slab is subjected to pressure and overturning loading. A tension/compression only analysis of the structure is performed.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US\US-27 Modeling Soil Springs for a Slab on Grade.STD when you install the program.

The numbers shown in the diagram below are the element numbers.

Figure 533: Example Problem No. 27

where:

\[
\begin{align*}
H &= 129', h1 = 8'\cdot 6", h2 = 8', h3 = 6' \\
v &= 40', v1 = 6'\cdot 6", v2 = 6', v3 = 7'\cdot 10", v4 = 4'
\end{align*}
\]

Every STAAD input file has to begin with the word STAAD. The word SPACE signifies that the structure is a space frame and the geometry is defined through X, Y, and Z axes. An optional title to identify this project is provided in the second line.

SET NL 3

This structure has to be analyzed for 3 primary load cases. Consequently, the modeling of our problem requires us to define 3 sets of data, with each set containing a load case and an associated analysis command. Also, the supports which get switched off in the analysis for any load case have to be restored for the analysis for the subsequent load case. To accommodate these requirements, it is necessary to have 2 commands: SET NL and CHANGE. The SET NL command is used above to indicate the total number of primary load cases that the file contains. The CHANGE command will come in later (after the PERFORM ANALYSIS command).
For joints 1 through 7, the joint number followed by the X, Y and Z coordinates are specified above. The coordinates of these joints is used as a basis for generating 21 more joints by incrementing the X coordinate of each of these 7 joints by 8.5 feet, 3 times. **REPEAT** commands are used to generate the remaining joints of the structure. The results of the generation may be visually verified using the STAAD graphical viewing facilities.

```
ELEMENT INCIDENCES
  1  1  8  9  2  TO  6
REPEAT  16  6  7
```

The incidences of element number 1 is defined and this data is used as a basis for generating the 2nd through the 6th element. The incidence pattern of the first 6 elements is then used to generate the incidences of 96 more elements using the **REPEAT** command.

```
UNIT INCH
ELEMENT PROPERTIES
  1 TO 102 TH 8.0
```

The thickness of elements 1 to 102 is specified as 8.0 inches following the command **ELEMENT PROPERTIES**.

```
DEFINE MATERIAL START
  ISOTROPIC CONCRETE
  E  4000.0
  POISSON  0.12
  DENSITY  8.68e-005
  ALPHA  5e-006
  DAMP  0.05
  G  1346.15
  TYPE CONCRETE
  STRENGTH FCU  4
END DEFINE MATERIAL
CONSTANTS
  MATERIAL CONCRETE ALL
```

The modulus of elasticity (E) and Poisson's Ratio are specified following the command **CONSTANTS**.

```
SPRING COMPRESSION
  1 TO 126 KFY
```

The above two lines declare the spring supports at nodes 1 to 126 as having the compression-only attribute. The supports themselves are being generated later (see the **ELASTIC MAT** command which appears later).

```
UNIT FEET
SUPPORTS
  1 TO 126 ELASTIC MAT DIRECTION Y SUBGRADE 12.0
```

The above command is used to instruct STAAD to generate supports with compression-only springs which are effective in the global Y direction. These springs are located at nodes 1 to 126. The subgrade reaction of the soil is specified as 12 kip/cu.ft. The program will determine the area under the influence of each joint and multiply the influence area by the subgrade reaction to arrive at the spring stiffness for the "FY" degree of freedom at the joint. Units for length are changed to FEET to facilitate the input of subgrade reaction of soil. See [TR.27.3 Automatic Spring Support Generator for Foundations](on page 2294).

```
LOAD  1 'WEIGHT OF MAT & EARTH'
  ELEMENT LOAD
  1 TO 102 PR GY -1.50
```

The above data describe a static load case. A pressure load of 1.50 kip/ft acting in the negative global Y direction is applied on all the elements.

```
PERFORM ANALYSIS PRINT STATICS CHECK
CHANGE
```
Tension/compression cases must each be followed by PERFORM ANALYSIS and CHANGE commands. The CHANGE command restores the original structure to prepare it for the analysis for the next primary load case.

Load case 2 consists of several joint loads acting in the negative global Y direction. This is followed by another ANALYSIS command. The CHANGE command restores the original structure once again for the forthcoming load case.

EX. US-28 Calculation of Modes and Frequencies of a Bridge

This example demonstrates the input required for obtaining the modes and frequencies of the skewed bridge shown in the figure below. The structure consists of piers, pier-cap girders and a deck slab.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US \US-28 Calculation of Modes and Frequencies of a Bridge.std when you install the program.

![Figure 534: Example Problem No. 28](image)

Every STAAD input file has to begin with the word STAAD. The word SPACE signifies that the structure is a space frame and the geometry is defined through X, Y and Z axes. The remainder of the words forms a title to identify this project.

** IGNORE LIST **

Further below in this file, we will call element lists in which some element numbers may not actually be present in the structure. We do so because it minimizes the effort involved in fetching the desired elements and reduces the size of the respective commands. To prevent the program from treating that condition (referring to elements which do not exist) as an error, the above command is required.

** UNIT METER KN **
The units for the data that follows are specified above.

```
<table>
<thead>
<tr>
<th>JOINT</th>
<th>COORDINATES</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1 0 0 0 ;</td>
</tr>
<tr>
<td></td>
<td>2 4 0 0 ;</td>
</tr>
<tr>
<td></td>
<td>3 6.5 0 0 ;</td>
</tr>
<tr>
<td></td>
<td>4 9 0 0 ;</td>
</tr>
<tr>
<td></td>
<td>5 11.5 0 0 ;</td>
</tr>
<tr>
<td></td>
<td>6 15.5 0 0 ;</td>
</tr>
<tr>
<td></td>
<td>11 -1 10 25</td>
</tr>
<tr>
<td></td>
<td>16.5 10 0</td>
</tr>
<tr>
<td></td>
<td>REPEAT ALL 3 4 0 14</td>
</tr>
</tbody>
</table>
```

For joints 1 through 6, the joint number followed by the X, Y and Z coordinates are specified first. Next, using the coordinates of joints 11 and 25 as the basis, joints 12 through 24 are generated using linear interpolation. Following this, using the data of these 21 joints (1 through 6 and 11 through 25), 63 new joints are generated. To achieve this, the X coordinate of these 21 joints is incremented by 4 meters and the Z coordinate is incremented by 14 meters, in 3 successive operations.

The REPEAT ALL command is used for the generation. Details of this command is available in TR.11 Joint Coordinates Specification (on page 2193). The results of the generation may be visually verified using STAAD.Pro's graphical viewing facilities.

```
<table>
<thead>
<tr>
<th>MEMBER</th>
<th>INCI</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1 1 13 ; 2 2 15 ; 3 3 17 ; 4 4 19 ; 5 5 21 ; 6 6 23</td>

<tr>
<td></td>
<td>68 68 76 ; 69 69 78 ; 70 70 80 ; 71 71 82 ; 72 72 84 ; 73 73 86</td>
</tr>
</tbody>
</table>
```

The member connectivity data (joint numbers between which members are connected) is specified for the 24 columns for the structure. The above method, where the member number is followed by the 2 node numbers, is the explicit definition method. No generation is involved here.

```
|        | 101 11 12 114 |
|        | 202 32 33 215 |
|        | 303 53 54 316 |
|        | 404 74 75 417 |
```

The member connectivity data is specified for the pier cap beams for the structure. The above method is a combination of explicit definition and generation. For example, member 101 is defined as connected between 11 & 12. Then, by incrementing those nodes by 1 unit at a time (which is the default increment), the incidences of members 102 to 114 are generated. Similarly, we create members 202 to 215, 303 to 316, and, 404 to 417.

```
<table>
<thead>
<tr>
<th>DEFINE</th>
<th>MESH</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>JOINT 11</td>
</tr>
<tr>
<td>B</td>
<td>JOINT 25</td>

<td>JOINT 67</td>
</tr>
<tr>
<td>F</td>
<td>JOINT 53</td>
</tr>
<tr>
<td>G</td>
<td>JOINT 88</td>
</tr>
<tr>
<td>H</td>
<td>JOINT 74</td>
</tr>
</tbody>
</table>
```

The next step is to generate the deck slab which will be modeled using plate elements. For this, we use a technique called mesh generation. Mesh generation is a process of generating several "child" elements from a "parent" or "super" element. The above set of commands defines the corner nodes of the super-element. Details of the above can be found in TR.14.2 Element Mesh Generation (on page 2204).

Note that instead of elaborately defining the coordinates of the corner nodes of the super-elements, we have taken advantage of the fact that the coordinates of these joints (A through H) have already been defined or
generated earlier. Thus, A is the same as joint 11 while D is the same as joint 32. Alternatively, we could have defined the super-element nodes as A -1 10 0 ; B 16.5 10 0 ; C 20.5 10 14 ; D 3 10 14 ; etc.

```
GENERATE ELEMENT
MESH ABCD 14 12
MESH DCEF 14 12
MESH FEGH 14 12
```

The above lines are the instructions for generating the “child” elements from the super-elements. For example, from the super-element bound by the corners A, B, C and D (which in turn are nodes 11, 25, 46 and 32), we generate a total of 14X12=168 elements, with 14 divisions along the edges AB and CD, and 12 along the edges BC and DA. These are the elements which make up the first span.

Similarly, 168 elements are created for the 2nd span, and another 168 for the 3rd span.

It may be noted here that we have taken great care to ensure that the resulting elements and the pier cap beams form a perfect fit. In other words, there is no overlap between the two in a manner that nodes of the beams are at a different point in space than nodes of elements. At every node along their common boundary, plates and beams are properly connected. This is absolutely essential to ensure proper transfer of load and stiffness from beams to plates and vice versa. The tools in the user interface may be used to confirm that beam-plate connectivity is proper for this model.

```

END GROUP DEFINITION
```

The above block of data is referred to as formation of groups. Group names are a mechanism by which a single moniker can be used to refer to a cluster of entities, such as members. For our structure, the pier cap beams are being grouped to a name called GIRDERS, the pier columns are assigned the name PIERS, and so on. For the deck, a few selected elements are chosen into a few selective groups. The reason is that these elements happen to be right beneath wheels of vehicles whose weight will be used in the frequency calculation.

```
MEMBER PROPERTY
  _GIRDERS PRIS YD 0.6 ZD 0.6
  _PIERS PRIS YD 1.0
```

Member properties are assigned as prismatic rectangular sections for the girders, and prismatic circular sections for the columns.

```
ELEMENT PROPERTY
  YRA 9 11 TH 0.375
```

The plate elements of the deck slab, which happen to be at a Y elevation of 10 metres (between a YRANGE of 9 metres and 11 metres) are assigned a thickness of 375 mms.

**Application Examples**

**EX. American Design Examples**

**STAAD.Pro**

**User Manual**
The Modulus of elasticity (E) is set to 21000 N/sq.mm for all members. The keyword CONSTANTS has to precede this data. Built-in default value for Poisson's ratio for concrete is also assigned to ALL members and elements.

The base nodes of the piers are fully restrained (FIXED supports).

Theoretically, a structure has as many modes of vibration as the number of degrees of freedom in the model. However, the limitations of the mathematical process used in extracting modes may limit the number of modes that can actually be extracted. In a large structure, the extraction process can also be very time consuming. Further, not all modes are of equal importance. (One measure of the importance of modes is the participation factor of that mode.) In many cases, the first few modes may be sufficient to obtain a significant portion of the total dynamic response.

Due to these reasons, in the absence of any explicit instruction, STAAD calculates only the first 6 modes. This is like saying that the command CUTOFF MODE SHAPE 6 has been specified.

If the inspection of the first 6 modes reveals that the overall vibration pattern of the structure has not been obtained, one may ask STAAD to compute a larger (or smaller) number of modes with the help of this command. The number that follows this command is the number of modes being requested. In our example, we are asking for 65 modes by specifying CUTOFF MODE SHAPE 65.
The mathematical method that STAAD uses is called the eigen extraction method. Some information on this is available in G.17.3 Dynamic Analysis (on page 2130). The method involves 2 matrices - the stiffness matrix, and the mass matrix.

The stiffness matrix, usually called the \([K]\) matrix, is assembled using data such as member and element lengths, member and element properties, modulus of elasticity, Poisson’s ratio, member and element releases, member offsets, support information, etc.

For assembling the mass matrix, called the \([M]\) matrix, STAAD uses the load data specified in the load case in which the MODAL CAL REQ command is specified. So, some of the important aspects to bear in mind are:

1. The input you specify is weights, not masses. Internally, STAAD will convert weights to masses by dividing the input by "g", the acceleration due to gravity.
2. If the structure is declared as a PLANE frame, there are 2 possible directions of vibration - global X, and global Y. If the structure is declared as a SPACE frame, there are 3 possible directions - global X, global Y and global Z. However, this does not guarantee that STAAD will automatically consider the masses for vibration in all the available directions.

You have control over and are responsible for specifying the directions in which the masses ought to vibrate. In other words, if a weight is not specified along a certain direction, the corresponding degrees of freedom (such as for example, global X at node 34 hypothetically) will not receive a contribution in the mass matrix. The mass matrix is assembled using only the masses from the weights and directions you specify.

In our example, notice that we are specifying the selfweight along global X, Y and Z directions. Similarly, a 200 kg/sq.m pressure load is also specified along all 3 directions on the deck.

But for the truck loads, we choose to apply it on just a few elements in the global Y and Z directions only. The reasoning is something like - for the X direction, the mass is not capable of vibrating because the tires allow the truck to roll along X. Remember, this is just a demonstration example, not necessarily what you may want to do.

The point we want to illustrate is that if you want to restrict a certain weight to certain directions only, all you need to do is not provide the directions in which those weights cannot vibrate in.

3. As much as possible, provide absolute values for the weights. STAAD is programmed to algebraically add the weights at nodes. So, if some weights are specified as positive numbers and others as negative, the total weight at a given node is the algebraic summation of all the weights in the global directions at that node and the mass is then derived from this algebraic resultant.

**MODAL CALCULATION REQUESTED**

This is the command which tells the program that frequencies and modes should be calculated. It is specified inside a load case. In other words, this command accompanies the loads that are to be used in generating the mass matrix.

Frequencies and modes have to be calculated also when dynamic analysis such as response spectrum or time history analysis is carried out. But in such analyses, the MODAL CALCULATION REQUESTED command is not explicitly required. When STAAD encounters the commands for response spectrum (see example 11) and time history (see examples 16 and 22), it automatically will carry out a frequency extraction without the help of the MODAL.. command.

**PERFORM ANALYSIS**
This initiates the processes which are required to obtain the frequencies. Frequencies, periods and participation factors are automatically reported in the output file when the operation is completed.

FINISH

This terminates the STAAD run.

**Understanding the output**

After the analysis is complete, look at the output file. (This file can be viewed by selecting the Analysis Output tool in the View group on the Utilities ribbon tab).

i. Mode number and corresponding frequencies and periods
Since we asked for 65 modes, we obtain a report, a portion of which is as shown:

**Table 895: Calculated Frequencies for Load Case 1**

<table>
<thead>
<tr>
<th>Mode</th>

</table>
In the explanation earlier for the CUT OFF MODE command, we said that one measure of the importance of a mode is the participation factor of that mode. We can see from the above report that for vibration along Z direction, the first mode has a 99.04 percent participation. It is also apparent that the 7th mode is primarily a Y direction mode with a 26.42% participation along Y and 0 in X and Z.

The $\Sigma X$, $\Sigma Y$ and $\Sigma Z$ columns show the cumulative value of the participation of all the modes up to and including a given mode (Corresponding to the SUMM-X, SUMM-Y, and SUMM-Z reported in the output, respectively). One can infer from those terms that if one is interested in 95% participation along X, the first 2 modes are sufficient.

But for the Y direction, even with 10 modes, we barely obtained 60%. The reason for this can be understood by an examination of the nature of the structure. The deck slab is capable of vibrating in several low energy and primarily vertical direction modes. The out-of-plane flexible nature of the slab enables it to vibrate in a manner resembling a series of wave like curves. Masses on either side of the equilibrium point have opposing eigenvector values leading to a lot of cancellation of the contribution from the respective masses. Localized modes, where small pockets in the structure undergo flutter due to their relative weak stiffness compared to the rest of the model, also result in small participation factors.

### iii. After the analysis is completed, select Post-processing from the mode menu. This screen contains facilities for graphically examining the shape of the mode in static and animated views. The Dynamics page on the left side of the screen is available for viewing the shape of the mode statically. The Animation option of the Results menu can be used for animating the mode. The mode number can be selected from the Loads and Results tab of the Diagrams dialog box which opens when the Animation option is chosen. The size to which the mode is drawn is controlled using the Scales tab of the Diagrams dialog box.

### EX. US-29 Time History Analysis of a Frame for Seismic Loads

Analysis and design of a structure for seismic loads is demonstrated in this example. In this model, static load cases are solved along with the seismic load case. For the seismic case, the maximum values of displacements, forces and reactions are obtained. The results of the dynamic case are combined with those of the static cases and steel design is performed on the combined cases.

This problem is installed with the program by default to the location \Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US\US-29 Time History Analysis of a Frame for Seismic Loads.std when you install the program.
Actual input is shown in bold lettering followed by explanation.

**STAAD SPACE DYNAMIC ANALYSIS FOR SEISMIC LOADS**

Every STAAD input file has to begin with the word STAAD. The word SPACE signifies that the structure is a space frame and the geometry is defined through X, Y and Z axes. The remainder of the words form a title to identify this project.

**UNIT METER KNS**

The units for the data that follows are specified above.

**JOINT COORDINATES**

1 0 0 0 ; 2 0 3.5 0 ; 3 0 5.3 0 ; 4 0 7 0
REPEAT ALL 1 9.5 0 0
REPEAT ALL 1 0 0 3
17 1.8 7 0 ; 18 4.6 7 0 ; 19 7.6 7 0
REPEAT ALL 1 0 0 3

For joints 1 through 4, the joint number is followed by the X, Y and Z coordinates as specified above. The coordinates of these joints are used as a basis for generating 12 more joints by incrementing the X & Z coordinates by specific amounts. REPEAT ALL commands are used for the generation. Details of these commands are available in TR11 Joint Coordinates Specification (on page 2193). Following this, another round of explicit definition (joints 17, 18 & 19) and generation (20, 21 & 22) is carried out. The results of the generation may be visually verified using graphical view features in STAAD.Pro.

**MEMBER INCIDENCES**

1 1 2 3
REPEAT 1 3 4
7 9 10 9
A mixture of explicit definition and generation of member connectivity data (joint numbers between which members are connected) is used to generate 29 members for the structure.

```
START GROUP DEFINITION
MEMBER
  _VERTICAL 1 TO 12
  _XBEAM 13 TO 20
  _ZBEAM 21 TO 24 29
  _BRACE 25 TO 28
END GROUP DEFINITION
```

The above block of data is referred to as formation of groups. Group names are a mechanism by which a single moniker can be used to refer to a cluster of entities, such as members. For our structure, the columns are being grouped to a name called VERTICAL, the beams running along the X direction are assigned the name XBEAM, and so on.

```
MEMBER PROPERTIES CANADIAN
  _VERTICAL TA ST W310X97
  _XBEAM TA ST W250X39
  _ZBEAM TA ST C200X17
  _BRACE TA ST L152X152X13
```

Member properties are assigned from the Canadian steel table. The members which receive these properties are those embedded within the respective group names. The benefit of using the group name is apparent here. Just from the looks of the command, we can understand that the diagonal braces are being assigned a single angle. The alternative, which would be

```
25 TO 28 TA ST L152X152X13
```

would have required us to go to the graphical tools to get a sense of what members 25 to 28 are.

```

CUT OFF MODE SHAPE 30

The above command is a critical command if you want to override the default number of modes computed and used in a dynamic analysis. The default, which is 6, may not always be sufficient to capture a significant portion of the structural response in a response spectrum or time history analysis, and hence the need to override the default. This command is explained in TR.30.1 Cut-Off Frequency, Mode Shapes, or Time (on page 2319).

UNIT METER
DEFINE TIME HISTORY
TYPE 1 ACCELERATION
READ EQDATA.TXT
ARRIVAL TIME
0.0
DAMPING 0.05

There are two stages in the command specification required for a time-history analysis. The first stage is defined above. Here, the parameters of the earthquake (ground acceleration) are provided.

Each data set is individually identified by the number that follows the TYPE command. In this file, only one data set is defined, which is apparent from the fact that only one TYPE is defined.

The word FORCE that follows the TYPE 1 command signifies that this data set is for a ground acceleration. (If you want to specify a forcing function, the keyword FORCE must be used instead.)

Notice the expression READ EQDATA.TXT. It means that we have chosen to specify the time vs. ground acceleration data in the file called EQDATA.TXT. That file must reside in the same folder as the one in which the data file for this structure resides. As explained in the small examples shown in TR.31.4 Definition of Time History Load (on page 2416), the EQDATA.TXT file is a simple text file containing several pairs of time-acceleration data. A sample portion of that file is as shown below.

<table>
<thead>
<tr>
<th>Time (sec)</th>
<th>Acceleration (m/s^2)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.0000</td>
<td>0.006300</td>
</tr>
<tr>
<td>0.0200</td>
<td>0.003640</td>
</tr>
<tr>
<td>0.0400</td>
<td>0.000990</td>
</tr>
<tr>
<td>0.0600</td>
<td>0.004280</td>
</tr>
<tr>
<td>0.0800</td>
<td>0.007580</td>
</tr>
<tr>
<td>0.1000</td>
<td>0.010870</td>
</tr>
</tbody>
</table>

While it may not be apparent from the above numbers, it may also be noted that the geological data for the site the building sits on indicate that the above acceleration values are a fraction of "g", the acceleration due to gravity. Thus, for example, at 0.02 seconds, the acceleration is 0.00364 multiplied by 9.806 m/sec^2 (or 0.00364 multiplied by 32.2 ft/sec^2). Consequently, the burden of informing the program that the values need to be multiplied by "g" is upon us, and we shall do so at a later step.

The arrival time value indicates the relative value of time at which the earthquake begins to act upon the structure. We have chosen 0.0, as there is no other dynamic load on the structure from the relative time standpoint. The modal damping ratio for all the modes is set to 0.05.

LOAD 1 WEIGHT OF STRUCTURE ACTING STATICALLY
SELFWEIGHT Y -1.0

The above data describe a static load case. The selfweight of the structure is acting in the negative global Y direction.

LOAD 2 PLATFORM LEVEL LOAD ACTING STATICALLY FLOOR LOAD
YRA 6.9 7.1 FLOAD -500
Load case 2 is also a static load case. At the Y=7.0m elevation, our structure has a floor slab. But, it is a non-structural entity which, though capable of carrying the loads acting on itself, is not meant to be an integral part of the framing system. It merely transmits the load to the beam-column grid.

There are uniform area loads on the floor (think of the load as wooden pallets supporting boxes of paper). Since the slab is not part of the structural model, how do we tell the program to transmit the imposed load from the slab to the beams without manually converting them to distributed beam loads ourselves? That is where the floor load utility comes in handy. It is a facility where we specify the load as a pressure, and the program converts the pressure to individual beam loads. Thus, the input required is very simple - load intensity in the form of pressure, and the region of the structure in terms of X, Y and Z coordinates in space, of the area over which the pressure acts.

In the process of converting the pressure to beam loads, STAAD will consider the empty space between criss-crossing beams (in plan view) to be panels, similar to the squares of a chess board. The load on each panel is then transferred to beams surrounding the panel, using a triangular or trapezoidal load distribution method.

```
LOAD 3 DYNAMIC LOAD
* MASSES
SELFWEIGHT X 1.0
SELFWEIGHT Y 1.0
SELFWEIGHT Z 1.0
FLOOR LOAD
YRANGE 6.9 7.1 FLOAD 500 GX
YRANGE 6.9 7.1 FLOAD 500 GY
YRANGE 6.9 7.1 FLOAD 500 GZ
```

Load case 3 is the dynamic load case, the one which contains the second part of the instruction set for a dynamic analysis to be performed. The data here are

a. loads which will yield the mass values which will populate the mass matrix
b. the directions of the loads, which will yield the degree of freedom numbers of the mass matrix for being populated.

Thus, the selfweight, as well as the imposed loads on the non-structural slab are to be considered as participating in the vibration along all the global directions.

```
GROUND MOTION X 1 1 9.806
```

The above command too is part of load case 3. Here we say that the seismic force, whose characteristics are defined by the TYPE 1 time history input data, acting at arrival time 1, is to be applied along the X direction. We mentioned earlier that the acceleration input data was specified as a fraction of “g”. The number 9.806 indicates the value which the acceleration data, as read from EQDATA.TXT are to be factored by before they are used.

```
LOAD COMBINATION 11 (STATIC + POSITIVE OF DYNAMIC)
1 1.0 2 1.0 3 1.0
LOAD COMBINATION 12 (STATIC + NEGATIVE OF DYNAMIC)
1 1.0 2 1.0 3 -1.0
```

In a time history analysis, the member forces FX thru MZ each have a value for every time step. If there are a 1000 time steps, there will be 1000 values of FX, 1000 for FY etc. for that load case. Not all of them can be used in a further calculation like a steel or concrete design. However, the maximum from among those time steps is available. If we want to do a design, one way to make sure that the structure is not under-designed is to create 2 load combination cases involving the dynamic case, a positive combination, and a negative combination.

That is what is being done above. Load combination case no. 11 consists of the sum of the static load cases (1 & 2) with the positive direction of the dynamic load case (3). Load combination case no. 12 consists of the sum of
the static load cases (1 & 2) with the negative direction of the dynamic load case (3). The user has discretion on what load factors to use with these combinations. We have chosen the factors to be 1.0.

PERFORM ANALYSIS

The above is the instruction to perform the analysis related calculations. That means, computing nodal displacements, support reactions, etc.

PRINT ANALYSIS RESULTS

The above command is an instruction to the program to produce a report of the joint displacements, support reactions and member end forces in the output file. As mentioned earlier, for the dynamic case, these will be just the maximum values, not the ones generated for every time step. If you want to see the results for each time step, you may do so by using STAAD's Post-processing facilities.

### Application Examples

**EX. British Design Examples**

**EX. UK-1 Plane Frame with Steel Design**

After one analysis, member selection is requested. Since member sizes change during the member selection, another analysis is done followed by final code checking to verify that the final sizes meet the requirements of the code based on the latest analysis results.
This problem is installed with the program by default to
C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK\UK-1 Plane Frame with Steel Design.STD when you install the program.

\[ L = 4.5 \text{ m}, H_1 = 6.0 \text{ m}, H_2 = 4.5 \text{ m}, \text{ and } H_3 = 2.7 \text{ m} \]
\[ WL_x = 9.0 \text{ KN/m}, WLy = 15 \text{ KN/m}, RL = 13.5 \text{ KN/m}, LL = 17.5 \text{ KN/m}, P_1 = 135 \text{ KN}, P_2 = 35 \text{ KN} \]
Members 1, 3, & 4 are a UC356X368X129, Members 5, 6, & 7 are a UB533X210X82, Member 2 is a UC254X254X73, Members 8 through 13 are a UB457X152X52. All other members comprising the truss are a UA100X100X8.

Actual input is shown in bold lettering followed by explanation.
Every input has to start with the term **STAAD**. The term **PLANE** signifies that the structure is a plane frame structure and the geometry is defined through X and Y axes.

**UNIT METER KN**

Defines the input units for the data that follows.

**JOINT COORDINATES**

```
1 0 0 ; 2 9 0 ; 3 0 6 ; 4 3 6
5 6 6 ; 6 9 6 ; 7 0 10.5
8 9 10.5 ; 9 2.25 10.5 ; 10 6.75 10.5
11 4.5 10.5 ; 12 1.5 11.4 ; 13 7.5 11.4
14 3 12.3 ; 15 6 12.3 ; 16 4.5 13.2
```

Joint number followed by X and Y coordinates are provided above. Since this is a plane structure, the Z coordinates need not be provided.

**Note:** Semicolons (;) are used as line separators to allow for input of multiple sets of data on one line.

**MEMBER INCIDENCE**

```
1 1 3 ; 2 3 7 ; 3 2 6 ; 4 6 8 ; 5 3 4
6 4 5 ; 7 5 6 ; 8 7 12 ; 9 12 14
10 14 16 ; 11 15 16 ; 12 13 15 ; 13 8 13
14 9 12 ; 15 9 14 ; 16 11 14 ; 17 11 15
18 10 15 ; 19 10 13 ; 20 7 9
21 9 11 ; 22 10 11 ; 23 8 10
```

Defines the members by the joints to which they are connected.

MEMBER PROPERTY BRITISH

```
1 3 4 TA ST UC356X368X129 ; 2 TA ST UC254X254X73
5 6 7 TA ST UB533X210X82 ; 8 TO 13 TA ST UB457X152X52
14 TO 23 TA ST UA100X100X8
```

Member properties are from the British steel table. The term **ST** stands for standard single section.

**MEMB TRUSS**

```
14 TO 23
```

The above command defines that members 14 through 23 are of type truss. This means that these members can carry only axial tension/compression and no moments.

**MEMB RELEASE**

```
5 START MZ
```

Member 5 has local moment-z (**MZ**) released at the start joint. This means that the member cannot carry any moment-z (i.e., strong axis moment) at node 3.

**UNIT KNS MMS**

**DEFINE MATERIAL START**

```
ISOTROPIC STEEL
E 210
POISSON 0.3
DENSITY 7.68191e-008
ALPHA 6e-006
DAMP 0.03
TYPE STEEL
STRENGTH FY 0.24821 FU 0.399894 RY 1.5 RT 1.2
END DEFINE MATERIAL
```
The `DEFINE MATERIAL` command initiates input for a material definition, which can later be assigned to all members. STAAD.Pro has several built-in material definitions, including the ISOTROPIC STEEL material used here. The length unit is changed to MMS (millimeters) to facilitate the input in familiar units.

```
CONSTANTS
BETA 90.0 MEMB 3 4
MATERIAL STEEL ALL
UNIT METER
```

The `CONSTANT` command initiates input for material constants or material definition references. The `BETA` command specifies that members 3 and 4 are rotated by 90 degrees around their own longitudinal axis. See G. 4.3 Relationship Between Global and Local Coordinates (on page 2069) for the definition of the beta angle.

```
SUPPORT
1 FIXED ; 2 PINNED
```

A fixed support is located at joint 1 and a pinned support at joint 2.

```
PRINT MEMBER INFORMATION LIST 1 5 14
PRINT MEMBER PROPERTY LIST 1 2 5 8 14
```

The above `PRINT` commands are self-explanatory. The `LIST` option restricts the print output to the members listed.

```
LOADING 1 DEAD AND LIVE LOAD

SELFWEIGHT Y -1.0
```

One of the components of load case 1 is the selfweight of the structure acting in the global Y direction with a factor of -1.0. Since global Y is vertically upward, the factor of -1.0 indicates that this load will act downwards.

```
JOINT LOAD
4 5 FY -65. ; 11 FY -155.
```

Load 1 contains joint loads also. FY indicates that the load is a force in the global Y direction.

```
MEMB LOAD
8 TO 13 UNI Y -13.5 ; 6 UNI GY -17.5
```

Load 1 contains member loads also. GY indicates that the load is in the global Y direction while Y indicates local Y direction. The term UNI stands for uniformly distributed load. Loads are applied on members 6, and 8 to 13.

```
CALCULATE RAYLEIGH FREQUENCY
```

The above command at the end of load case 1, is an instruction to perform a natural frequency calculation based on the Rayleigh method using the data in the above load case.

```
LOADING 2 WIND FROM LEFT
MEMBER LOAD
1 2 UNI GX 9.0 ; 8 TO 10 UNI Y -15.0
```

Load case 2 is initiated and contains several member loads.

```
* 1/3 RD INCREASE IS ACCOMPLISHED BY 75% LOAD
LOAD COMB 3 75 PERCENT DL LL WL
1 0.75 2 0.75
```

The above command identifies a combination load (case no. 3) with a title. The second line provides the load cases and their respective factors used for the load combination.
PERFORM ANALYSIS

This command instructs the program to proceed with the analysis.

LOAD LIST 1 3

The above command activates load cases 1 and 3 only for the commands to follow. This also means that load case 2 will be made inactive.

PRINT MEMBER FORCES
PRINT SUPPORT REACTION

The above PRINT commands are self-explanatory. Also note that all the forces and reactions will be printed for load cases 1 and 3 only.

PARAMETER
  CODE EN 1993-1-1:2005
  NA 1
  NSF 0.85 ALL
  BEAM 1 ALL
  KY 1.2 MEMB 3 4
  RATIO 0.9 ALL

The PARAMETER command is used to specify steel design parameters such as net section factor (NSF), effective length factor for bending about the minor axis (KY), etc. Information on these parameters can be obtained from the manual where the implementation of the code is explained. The BEAM parameter is specified to perform design at every 1/12th point along the member length, which is also the default. The RATIO parameter specifies that the ratio of actual loading over section capacity should not exceed 0.9.

SELECT ALL

The above command instructs the program to select the most economic section for all the members based on the results of the analysis.

GROUP MEMB 1 3 4
GROUP MEMB 5 6 7
GROUP MEMB 8 TO 13
GROUP MEMB 14 TO 23

Although the program selects the most economical section for all members, it is not always practical to use many different sizes in one structure. Grouping is a procedure by which the cross section which has the largest value for the specified attribute, which in this case is the default and hence the AREA, from among the associated member list, is assigned to all members in the list. Hence, the cross sections for members 1, 3 and 4 are replaced with the one with the largest area from among the three.

PERFORM ANALYSIS

As a result of the selection and grouping, the member sizes are no longer the same as the ones used in the original analysis. Hence, it is necessary to reanalyze the structure using the new properties to get new values of forces in the members.

PARAMETER
  BEAM 1.0 ALL
  RATIO 1.0 ALL
  TRACK 1.0 ALL
A new set of values are now provided for the above parameters. The actual load to member capacity RATIO has been redefined as 1.0. The TRACK parameter tells the program to print out the design results to the intermediate level of descriptively.

CHECK  CODE  ALL

With the above command, the latest member sizes with the latest analysis results are checked to verify that they satisfy the CODE specifications.

STEEL  TAKE  OFF

This command instructs the program to list the length and weight of all the different member sizes.

FINISH

This command terminates the STAAD run.

EX. UK-2 Area Load Generation on Floor Structure

A floor structure (bound by global X-Z axis) made up of steel beams is subjected to area load (i.e., load/area of floor). Load generation based on one-way distribution is illustrated in this example.

In the case of loads such as joint loads and member loads, the magnitude and direction of the load at the applicable joints and members is directly known from the input. However, the area load is a different sort of load where a load intensity on the given area has to be converted to joint and member loads. The calculations required to perform this conversion are done only during the analysis. Consequently, the loads generated from the AREA LOAD command can be viewed only after the analysis is completed.

This problem is installed with the program by default to 
C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK \UK-2 Area Load Generation on Floor Structure.STD when you install the program.
Figure 536: Example Problem No. 2

Where:

W1 = 1.5 m, W2 = 1.0 m, W3 = 1.5 m, L1 = 2.0 m, L2 = 4.5 m, L3 = 3.0 m

Actual input is shown in bold lettering followed by explanation.

STAAD FLOOR A FLOOR FRAME DESIGN WITH AREA LOAD

Every input has to start with the term STAAD. The term FLOOR signifies that the structure is a floor structure and the structure is in the x–z plane.

UNIT METER KNS

Defines the input units for the data that follows.

JOINT COORDINATES
1 0 0 5 6 0 0 ; 7 1.5 0 3
8 3 0 3 ; 9 4 0 3 ; 10 4.5 0 3 ; 11 5 0 3
12 6 0 3 ; 13 0 0 7.5 ; 14 1.5 0.7.5
15 3.5 0 7.5
Joint numbers followed by X, Y and Z coordinates are provided above. Since this is a floor structure, the Y coordinates are all the same (in this case, zero). Joints between 1 and 5 (i.e., 2, 3, 4) are generated in the first line of input, taking advantage of the equal spacing between the joints (refer to TR.11 Joint Coordinates Specification (on page 2193) for more information).

**Note:** Semicolons (;) are used as line separators to allow for input of multiple sets of data on one line.

```
<table>
<thead>

4 9 13 14 15 18 25 19 21 TO 24 END MZ
```

The first set of members (1 5 10 etc) have local moment-z (MZ) released at the start joint. This means that these members cannot carry any moment-z (i.e., strong axis moment) at the start joint. The second set of members have MZ released at the end joints.

**Note:** Any line beginning with an asterisk (*) character is treated as a comment line.

END DEFINE MATERIAL
UNIT METER
```

Define the material properties for steel. The units are changed to millimeters and then back to meters in order to facilitate inputing the values in familiar units.

```
CONSTANT
MATERIAL STEEL ALL
```

The CONSTANT command instructs the program to use the defined steel material for all members.

```
SUPPORT
1 5 13 17 20 21 FIXED
```
A fixed support has been specified at the above joints.

| LOADING 1 14.5 KN/sq.m. DL+LL |

Load case 1 is initiated followed by a title.

| FLOOR LOAD |
| YRANGE -0.5 0.5 FLOAD -14.5 |

All members within a range of -0.5 meters to 0.5 meters in the global Y direction (which is the entire floor of this model) are subjected to an floor load of 14.5 KN/sq.m. The program converts area loads into individual member loads.

| PERFORM ANALYSIS PRINT LOAD DATA |

This command instructs the program to proceed with the analysis. The PRINT LOAD DATA command is specified to obtain a listing of the member loads which were generated from the FLOOR LOAD.

| PARAMETERS |
| CODE BRITISH |
| BEAM 1 ALL |
| DMAX 0.6 ALL |
| DMIN 0.3 ALL |
| UNL 0.3 ALL |

The PARAMETER command is used to specify steel design parameters (refer to D3.B.6 Design Parameters (on page 1377)). Design is to be performed per the specifications of the BS 5950 2000 Code. The BEAM parameter is specified to perform design at every 1/12th point along the member length. DMAX and DMIN specify maximum and minimum depth limitations to be used during member selection. UNL is used to specify unsupported length of the compression flange to be used for calculation of allowable bending stress.

| SELECT MEMB 2 6 11 14 15 16 18 19 21 23 24 27 |

The above command instructs the program to select the most economical section from the British steel table for the members listed.

| FINISH |

The FINISH command terminates the STAAD run.

### Warning**

Some member sizes have changed since last analysis. In the post processor, member queries will use the last analysis forces with the updated member sizes. To correct this inconsistency, please do one more analysis. From the upper menu, press results, update properties, then file save; then analyze again without the group or select commands.

Help->Technical Support
EX. UK-3 Soil Springs for Portal Frame

A portal frame type steel structure is sitting on concrete footings. The soil is to be considered as an elastic foundation. The value of soil subgrade reaction is known from which spring constants are calculated by multiplying the subgrade reaction by the tributary area of each modeled spring.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK\UK-3 Soil Springs for Portal Frame.STD when you install the program.

Where:

\[ B = 6 \text{ m}, \quad H = 3 \text{ m}, \quad F_1 = 1.2 \text{ m}, \quad F_2 = 2.4 \text{ m} \]
\[ P = 20 \text{ KN}, \quad w = 4.5 \text{ KN/m} \]
\[ \text{Soil Subgrade Reaction} = 41,666.67 \text{ KN/m}^3 \]
Table 897: Spring constant calculation

<table>
<thead>
<tr>
<th>Springs of Joints</th>
<th>Spring Constant</th>

<tr>
<td></td>
<td>= 30,000 KN/m</td>
</tr>
<tr>
<td>2, 3, 4, 11, 12, &amp; 13 (Interior)</td>
<td>2.4 x 0.6 x 41,666.67</td>
</tr>
<tr>
<td></td>
<td>= 60,000 KN/m</td>
</tr>
</tbody>
</table>

Actual input is shown in bold lettering followed by explanation.

**STAAD PLANE PORTAL ON FOOTING FOUNDATION**

Every input has to start with the term **STAAD**. The term **PLANE** signifies that the structure is a plane frame structure and the geometry is defined through X and Y axes.

**UNIT METER KNS**

Defines the input units for the data that follows.

**JOINT COORDINATES**

1 0.0 0.0 0.0 5 2.4 0.0 0.0
6 1.2 3.0 0.0 ; 7 1.2 6.0 0.0
8 7.2 6.0 0.0 ; 9 7.2 3.0 0.0
10 6.0 0.0 0.0 14 8.4 0.0 0.0

Joint number followed by X, Y and Z coordinates are provided above. Since this is a plane structure, the Z coordinates are given as all zeros.

**Note**: Semicolons (;) are used as line separators to allow for input of multiple sets of data on one line.

**MEMBER INCIDENCES**

1 1 2 4
5 3 6 ; 6 6 7
7 7 8 ; 8 6 9
9 8 9 ; 10 9 12
11 10 11 14

Defines the members by the joints to which they are connected.

**MEMBER PROPERTIES BRITISH**

1 4 11 14 PRIS YD 0.30 ZD 2.40
2 3 12 13 PRIS YD 0.60 ZD 2.40
5 6 9 10 TABLE ST J0254X203
7 8 TA ST UB305X165X40

The first two lines define member properties as prismatic (PRIS) followed by depth (YD) and width (ZD) values. The program will calculate the properties necessary to perform the analysis. See G.6.1 Prismatic Properties (on page 2091) for additional information. Member properties for the remaining members are chosen from the British steel table. The term ST stands for standard single section.

DEFINE MATERIAL START
ISOTROPIC STEEL
E 210

**STAAD.Pro** 6557 **User Manual**
The CONSTANT command initiates input for material constants like modulus of elasticity, Density, and Poisson's ratio. The length unit is changed from METER to MM to facilitate the input in familiar units.

Note: Any line beginning with an asterisk (*) character is treated as a comment line.

The supports for the structure are specified above. The first set of joints are supports restrained in all directions except global moment-z (MZ). Also, a spring having a spring constant of 60 KN/mm is provided in the global Y direction at these nodes. The second set is similar to the former except for a different value of the spring constant.

The selfweight of the structure is specified as acting in the global Y direction with a -1.0 factor. Since global Y is vertically upwards, the -1.0 factor indicates that this load will act downwards.

Load 1 contains joint loads also. FX indicates that the load is a force in the global X direction.

Load 1 contains member loads also. GY indicates that the load acts in the global Y direction. The term UNI stands for uniformly distributed load, and is applied on members 7 and 8, acting downwards.

This command instructs the program to proceed with the analysis.
The above PRINT command instructs the program to print analysis results which include joint displacements, member forces and support reactions.

FINISH

This command terminates the STAAD run.

EX. UK-4 Inactive Members in a Braced Frame

This example is a typical case of a load-dependent structure where the structural condition changes for different load cases. In this example, different bracing members are made inactive for different load cases. This is done to prevent these members from carrying any compressive forces.

This problem is installed with the program by default to 
C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK \UK-4 Inactive Members in a Braced Frame.STD when you install the program.

Where:

L1 = 4.5 m, L2 = 6.0m  
P1 = 45 kN, P2 = 90 kN

Actual input is shown in bold lettering followed by explanation.
Every input has to start with the term **STAAD**. The term **PLANE** signifies that the structure is a plane frame structure and the geometry is defined through X and Y axes.

**UNIT METER KNS**

Defines the input units for the data that follows.

**SET NL 3**

This structure has to be analyzed for three primary load cases. Consequently, the modeling of our problem requires us to define three sets of data, with each set containing a load case and an associated analysis command. Also, the members which get switched off in the analysis for any load case have to be restored for the analysis for the subsequent load case. To accommodate these requirements, it is necessary to have two commands, one called **SET NL** and the other called **CHANGE**. The **SET NL** command is used above to indicate the total number of primary load cases that the file contains. The **CHANGE** command will come in later (after the **PERFORM ANALYSIS** command).

**JOINT COORDINATES**

```
1 0 0 0 3 12. 0. 0.
4 0 4.5 0 6 12. 4.5 0.
7 6. 9. 0.; 8 12. 9. 0.
```

Joint number followed by X, Y and Z coordinates are provided above. Since this is a plane structure, the Z coordinates are given as all zeros.

**Note:** Semicolons (;) are used as line separators to allow for input of multiple sets of data on one line.

**MEMBER INCIDENCE**

```
1 1 4 2 ; 3 5 7 ; 4 3 6 ; 5 6 8 ; 6 4 5 7
8 7 8 ; 9 1 5 ; 10 2 4 ; 11 3 5 ; 12 2 6
13 6 7 ; 14 5 8
```

Defines the members by the joints to which they are connected.

**MEMBER TRUSS**

```
9 TO 14
```

The preceding command defines that members 9 through 14 are of type truss. This means these members can only carry axial tension/compression and no moments.

**MEMBER PROP BRITISH**

```
1 TO 5 TABLE ST UB305X165X40
6 7 8 TA ST UB457X152X52
9 TO 14 TA LD UA150X150X10
```

Properties for all members are assigned from the British steel table. The word **ST** stands for standard single section. The word **LD** stands for long leg back-to-back double angle. Since the spacing between the two angles of the double angle is not provided, it is assumed to be 0.0.

**UNIT MMS**

**DEFINE MATERIAL START**

```
ISOTROPIC STEEL
E 210
POISSON 0.3
DENSITY 7.6819e-008
ALPHA 6e-006
DAMP 0.03
TYPE STEEL
STRENGTH FY 0.24821 FU 0.399894 RY 1.5 RT 1.2
```

**END DEFINE MATERIAL**
The **DEFINE MATERIAL** command is used to define a material. The **CONSTANT** command is used to assign this material to all members. Length unit is changed from METER to MMS.

Pinned supports are specified at Joints 1, 2, and 3. The word **PINNED** signifies that no moments will be carried by these supports.

The preceding command makes the listed members inactive. The stiffness contribution of these members will not be considered in the analysis till they are made active again.

Load case 1 is initiated followed by a title. The length UNIT is changed from MMS to METER for input values which follow.

Load 1 contains member loads. **GY** indicates that the load acts in the global Y direction. The word **UNI** stands for uniformly distributed load. The load is applied on members 6, 7, and 8.

This command instructs the program to proceed with the analysis. It is worth noting that members 9 to 14 will not be used in this analysis since they were declared inactive earlier. In other words, for dead and live load, the bracing members are not used to carry any load.

A new set of members are made inactive. The stiffness contribution from these members will not be used in the analysis till they are made active again. They have been inactivated to prevent them from being subject to compressive forces for the next load case.

Load case 2 is initiated followed by a title.

Load 2 contains joint loads. **FX** indicates that the load is a force in the global X direction. Nodes 4 and 7 are subjected to the loads.

This command instructs the program to proceed with the analysis. The analysis will be performed for load case 2 only.
The above CHANGE command is an instruction to re-activate all inactive members.

| INACTIVE MEMBERS 9 12 14 |

Members 9, 12 and 14 are made inactive. The stiffness contribution of these members will not be used in the analysis till they are made active again. They have been inactivated to prevent them from being subject to compressive forces for the next load case.

| LOADING 3 WIND FROM RIGHT |

Load case 3 is initiated followed by a title.

| JOINT LOAD |
| 6 FX -135 ; 8 FX -65 |

Load 3 contains joint loads at nodes 6 and 8. FX indicates that the load is a force in the global X direction. The negative numbers (-135 and -65) indicate that the load is acting along the negative global X direction.

| LOAD COMBINATION 4 |
| 1 0.75 2 0.75 |
| LOAD COMBINATION 5 |
| 1 0.75 3 0.75 |

Load combination case 4 involves the algebraic summation of the results of load cases 1 and 2 after multiplying each by a factor of 0.75. For load combinations, the program simply gathers the results of the component primary cases, factors them appropriately, and combines them algebraically. Thus, an analysis in the real sense of the term (multiplying the inverted stiffness matrix by the load vector) is not carried out for load combination cases. Load combination case 5 combines the results of load cases 1 and 3.

| PERFORM ANALYSIS |

This command instructs the program to proceed with the analysis. Only primary load case 3 will be considered for this analysis. (As explained earlier, a combination case is not truly analyzed for, but handled using other means.)

| CHANGE |

The above CHANGE command will re-activate all inactive members.

| LOAD LIST ALL |

At the end of any analysis, only those load cases for which the analysis was done most recently, are recognized as the "active" load cases. The LOAD LIST ALL command enables all the load cases in the structure to be made active for further processing.

| PRINT MEMBER FORCES |

The preceding PRINT command is an instruction to produce a report, in the output file, of the member end forces.

| LOAD LIST 1 4 5 |

A LOAD LIST command is a means of instructing the program to use only the listed load cases for further processing.

| PARAMETER |
| CODE EN 1993-1-1:2005 |
| NA 1 |
| BEAM 1 ALL |
| UNL 1.8 ALL |
| KY 0.5 ALL |
The **PARAMETER** command is used to specify the steel design parameters (information on these parameters can be obtained from the manual where the implementation of the code is explained). The **BEAM** parameter is specified to perform design at every 1/12\textsuperscript{th} point along the member length. **UNL** represents the unsupported length to be used for calculation of allowable bending stress. **KY 0.5 ALL** sets the effective length factor for column buckling about the local Y-axis to be 0.5 for ALL members.

EX. UK-5 Support Settlement on a Portal Frame

This example demonstrates the application of support displacement load (also known as a sinking support) on a space frame structure.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK\UK-5 Support Settlement on a Portal Frame.STD when you install the program.

![Diagram of Example Problem No. 5]

Figure 539: Example Problem No. 5

Where:

L1 = 3.0m
L2 = 6.0m

Actual input is shown in bold lettering followed by explanation.

**STAAD SPACE TEST FOR SUPPORT DISPLACEMENT**

Every input has to start with the term STAAD. The word SPACE signifies that the structure is a space frame structure (3-D) and the geometry is defined through X, Y and Z coordinates.

**UNITS METER KNS**

Defines the input units for the data that follows.

**JOINT COORDINATES**

1 0.0 0.0 0.0 ; 2 0.0 3.0 0.0
3 6.0 3.0 0.0 ; 4 6.0 0.0 0.0
5 6.0 3.0 6.0 ; 6 6.0 0.0 6.0

Joint number followed by X, Y and Z coordinates are provided above.
MEMBER INCIDENCE
1 1 2 3
4 3 5 ; 5 5 6

Defines the members by the joints to which they are connected.

UNIT MMS
MEMB PROP
1 to 5 PRIS AX 6450 IZ 1.249E+08 IY 1.249E+08 IX 4.162E+06

Member properties have been defined above using the PRISMATIC attribute. Values of AX (area), IZ (moment of inertia about major axis), IY (moment of inertia about minor axis) and IX (torsional constant) are provided in MMS unit.

DEFINE MATERIAL START
ISOTROPIC STEEL

DAMP 0.03
TYPE STEEL
STRENGTH FY 0.24821 FU 0.399894 RY 1.5 RT 1.2
END DEFINE MATERIAL
CONANTS
MATERIAL STEEL ALL

Material are defined using the DEFINE MATERIAL command and then assigned using the CONSTANT command.

SUPPORT
1 4 6 FIXED

Joints 1, 4 and 6 are fixed supports.

LOADING 1 SINKING SUPPORT

Load case 1 is initiated followed by a title.

SUPPORT DISPLACEMENT LOAD
4 FY -15

Load 1 is a support displacement load which is also commonly known as a sinking support. FY signifies that the support settlement is in the global Y direction and the value of this settlement is 15mm downward.

PERFORM ANALYSIS

This command instructs the program to proceed with the analysis.

PRINT ANALYSIS RESULTS

The above PRINT command instructs the program to print joint displacements, support reactions and member forces.

FINISH

This command terminates the STAAD run.

### EX. UK-6 Prestress and Poststress Loading

This is an example of prestress loading in a plane frame structure.

It covers two situations:

1. From the member on which it is applied, the prestressing effect is transmitted to the rest of the structure through the connecting members (known in the program as PRESTRESS load).
2. The prestressing effect is experienced by the member(s) alone and not transmitted to the rest of the structure (known in the program as POSTSTRESS load).

This problem is installed with the program by default to `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK\UK-6 Prestress and Poststress Loading.STD` when you install the program.

************************************************************
Where:

\[ L_1 = 4.5 \text{ m} \]
\[ L_2 = 6 \text{ m} \]
\[ L_3 = 12 \text{ m} \]

Actual input is shown in bold lettering followed by explanation.

**STAAD PLANE FRAME WITH PRESTRESSING LOAD**

Every input has to start with the term **STAAD**. The term **PLANE** signifies that the structure is a plane frame structure and the geometry is defined through X and Y axes.

**UNIT METER KNS**

Defines the input units for the data that follows.

**JOINT COORD**

1 0 0 ; 2 12 0 ; 3 0 6 ; 4 12 6.
5 0 10.5 ; 6 12 10.5 ; 7 0 15. ; 8 12 15.

Joint number followed by \( \text{X} \) and \( \text{Y} \) coordinates are provided above. Since this is a plane structure, the \( \text{Z} \) coordinates need not be provided.

**Note:** Semicolons (;) are used as line separators to allow for input of multiple sets of data on one line.

**MEMBER INCIDENCE**

1 1 3 ; 2 3 5 ; 3 5 7 ; 4 2 4 ; 5 4 6
6 6 8 ; 7 3 4 ; 8 5 6 ; 9 7 8
Defines the members by the joints to which they are connected.

<table>
<thead>
<tr>
<th>SUPPORT</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 2 FIXED</td>
</tr>
</tbody>
</table>

The supports at joints 1 and 2 are defined to be fixed supports.

<table>
<thead>
<tr>
<th>MEMB PROP</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 TO 9 PRI AX 0.2044 IZ 8.631E-03</td>
</tr>
</tbody>
</table>

Member properties are provided using the PRI (prismatic) attribute. Values of area (AX) and moment of inertia about the major axis (IZ) are provided.

```
UNIT MMS
DEFINE MATERIAL START
    ISOTROPIC CONCRETE
    E 21.0
    POISSON 0.17
    DENSITY 2.36158e-008
    ALPHA 5e-006
    DAMP 0.05
    G 9.25
    TYPE CONCRETE
    STRENGTH FCU 0.0275
END DEFINE MATERIAL
CONSTANTS
MATERIAL CONCRETE ALL
```

The `DEFINE MATERIAL` command is used to specify material properties and the `CONSTANT` is used to assign the material to all members. Length unit is changed from METER to MMS to facilitate the input.

</tr>
</thead>
<tbody>
<tr>
<td>MEMBER PRESTRESS</td>
</tr>
<tr>
<td>7 8 FORCE 1350. ES 75. EM -300. EE 75.</td>
</tr>
</tbody>
</table>

Load case 1 is initiated followed by a title. Load 1 contains PRESTRESS load. Members 7 and 8 have a cable force of 1350 KNs. The location of the cable at the start (ES) and end (EE) is 75 MMs above the centre of gravity while at the middle (EM) it is 300 MMs below the c.g. The assumptions and facts associated with this type of loading are explained in [G.15.5 Prestress and Poststress Member Load](on page 2108).

<table>
<thead>
<tr>
<th>LOADING 2 POSTSTRESSING LOAD</th>

</thead>
<tbody>
<tr>
<td>MEMBER POSTSTRESS</td>
</tr>
<tr>
<td>7 8 FORCE 1350. ES 75. EM -300. EE 75.</td>
</tr>
</tbody>
</table>

Load case 2 is initiated followed by a title. Load 2 is a POSTSTRESS load. Members 7 and 8 have a cable force of 1350 KNs. The location of the cable is the same as in load case 1. For a difference between PRESTRESS loading and POSTSTRESS loading, as well as additional information about both types of loads, please refer to [G.15.5 Prestress and Poststress Member Load](on page 2108).

| PERFORM ANALYSIS |

This command instructs the program to perform the analysis.

| UNIT METER |
| PRINT ANALYSIS RESULTS |

The preceding command is an instruction to write joint displacements, support reactions and member forces in the output file. The preceding line causes the results to be written in the length unit of meters.

| FINISH |

This command terminates the STAAD run.

**EX. UK-7 Modeling Offset Connections in a Frame**

This example illustrates modeling of structures with offset connections. Offset connections arise when the center lines of the connected members do not intersect at the connection point. The connection eccentricity behaves as a rigid link and is modeled through specification of **MEMBER OFFSETS**.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK \UK-7 Modeling Offset Connections in a Frame.STD when you install the program.
Where:

- $L_1 = 4.5 \text{ m}$
- $L_2 = 6 \text{ m}$
- $L_3 = 178 \text{ mm}$
- $L_4 = 152 \text{ mm}$

Actual input is shown in bold lettering followed by explanation.

**STAAD PLANE TEST FOR MEMBER OFFSETS**

Every input has to start with the term STAAD. The term PLANE signifies that the structure is a plane frame structure and the geometry is defined through X and Y axes.

**UNIT METER KNS**

Defines the input units for the data that follows.

**JOINT COORD**

- $1 \ 0. \ 0. ; \ 2 \ 6. \ 0. ; \ 3 \ 0. \ 4.5$
- $4 \ 6. \ 4.5 ; \ 5 \ 0. \ 9. ; \ 6 \ 6. \ 9.$

Joint number followed by X and Y coordinates are provided above. Since this is a plane structure, the Z coordinates need not be provided.

**Note:** Semicolons (;) are used as line separators to allow for input of multiple sets of data on one line.

**SUPPORT**

- $1 \ 2 \ PINNED$
Pinned supports are specified at joints 1 and 2. The word PINNED signifies that no moments will be carried by these supports.

```
MEMB INCI
  1 3 2 ; 3 3 4
  5 4 ; 6 6 ; 7 1 4
```

Defines the members by the joints to which they are connected.

```
MEMB PROP BRITISH
  1 TO 4 TABLE ST UC356X368X129
  5 6 TA ST UB305X165X40
  7 TA LD UA200X150X12
```

All member properties are from British steel table. The word ST stands for standard single section. LD stands for long leg back-to-back double angle.

```
UNIT MMS
MEMB OFFSET
  5 6 START 178. 0.0 0.0
  5 6 END -178. 0.0 0.0
  7 END -178.0 -152.0 0.0
```

The preceding specification states that an OFFSET is located at the START/END joint of the members. The X, Y, and Z global coordinates of the offset distance from the corresponding incident joint are also provided. These attributes are applied to members 5, 6, and 7.

```
DEFINE MATERIAL START

STAAD.Pro  6590 User Manual
EX. UK-8 Concrete Design for a Space Frame

In this example, concrete design is performed on some members of a space frame structure. Design calculations consist of computation of reinforcement for beams and columns. Secondary moments on the columns are obtained through the means of a P-Delta analysis.

This problem is installed with the program by default to
C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK\UK-8 Concrete Design for a Space Frame.STD when you install the program.
The above example represents a space frame, and the members are made of concrete. The input in the next page will show the dimensions of the members.

Two load cases, namely one for dead plus live load and another with dead, live and wind load, are considered in the design.

Actual input is shown in bold lettering followed by explanation.

STAAD SPACE FRAME WITH CONCRETE DESIGN

UNIT METER KNS

Joint number followed by X, Y and Z coordinates are provided above.
Note: Semicolons (;) are used as line separators to allow for input of multiple sets of data on one line.

11 TO 21 PR YD 535.0 ZD 380 IZ 2.409E09 IY 1.229E09 -
IX 2.704E09

All member properties are provided using the PRISMATIC option. YD and ZD stand for depth and width. If ZD is not provided, a circular shape with diameter = YD is assumed for that cross section. All properties required for the analysis, such as, Area, Moments of Inertia, etc. are calculated automatically from these dimensions unless these are explicitly defined. For this particular example, moments of inertia (IZ, IY) and torsional constant (IX) are provided, so these will not be recalculated. The IX, IY, and IZ values provided in this example are only half the values of a full section to account for the fact that the full moments of inertia will not be effective due to cracking of concrete.

UNIT METER

The DEFINE MATERIAL command is used to define material properties for concrete. The CONSTANT command is used to assign this to all members.

SUPPORT
1 TO 6 FIXED

Joints 1 to 6 are fixed supports.

LOAD 1 (1.4DL + 1.7LL)

Load case 1 is initiated followed by a title.

SELF Y -1.4
The self-weight of the structure is applied in the global Y direction with a -1.4 factor. Since global Y is vertically upward, the negative factor indicates that this load will act downwards.

<table>
<thead>
<tr>
<th>MEMB LOAD</th>
</tr>
</thead>
<tbody>
<tr>
<td>11 TO 16 UNI Y -42.0</td>
</tr>
<tr>
<td>11 TO 16 UNI Y -76.5</td>
</tr>
</tbody>
</table>

Load 1 contains member loads also. Y indicates that the load is in the local Y direction. The word UNI stands for uniformly distributed load.

| LOAD 2 .75 (1.4DL + 1.7LL + 1.7WL) |

Load case 2 is initiated followed by a title.

<table>
<thead>
<tr>
<th>REPEAT LOAD</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 0.75</td>
</tr>
</tbody>
</table>

The preceding command will gather the load data values from load case 1, multiply them with a factor of 0.75 and utilize the resulting values in load 2.

<table>
<thead>
<tr>
<th>JOINT LOAD</th>
</tr>
</thead>
<tbody>
<tr>
<td>15 16 FZ 40.0</td>
</tr>
<tr>
<td>11 FZ 90.0</td>
</tr>
<tr>
<td>12 FZ 70.0</td>
</tr>
<tr>
<td>10 FZ 40.0</td>
</tr>
</tbody>
</table>

Load 2 contains some additional joint loads also. FZ indicates that the load is a force in the global Z direction.

<table>
<thead>
<tr>
<th>PDELTA ANALYSIS</th>
</tr>
</thead>
</table>

This command instructs the program to proceed with the analysis. The analysis type is P-DELTA indicating that second-order effects are to be calculated.

| PRINT FORCES LIST 2 5 9 14 16 |

Member end forces are printed using the above PRINT commands. The LIST option restricts the print output to the members listed.

<table>
<thead>
<tr>
<th>START CONCRETE DESIGN</th>
</tr>
</thead>
</table>

The above command initiates a concrete design.

<table>
<thead>
<tr>
<th>CODE BRITISH</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRACK 1.0 MEMB 14</td>
</tr>
<tr>
<td>TRACK 2.0 MEMB 16</td>
</tr>
<tr>
<td>MAXMAIN 40 ALL</td>
</tr>
</tbody>
</table>

The values for the concrete design parameters are defined in the above commands. Design is performed per the BS 8110 Code. The TRACK value dictates the extent of design related information provided in the output. MAXMAIN indicates that the maximum size of main reinforcement is the 40 mm bar. These parameters are described in the manual where British concrete design related information is available.

<table>
<thead>
<tr>
<th>DESIGN BEAM 14 16</th>
</tr>
</thead>
</table>

The above command instructs the program to design beams 14 and 16 for flexure, shear, and torsion.

<table>
<thead>
<tr>
<th>DESIGN COLUMN 2 5</th>
</tr>
</thead>
</table>

The above command instructs the program to design columns 2 and 5 for axial load and biaxial bending.

<table>
<thead>
<tr>
<th>END CONCRETE DESIGN</th>
</tr>
</thead>
</table>

This will end the concrete design.

<table>
<thead>
<tr>
<th>FINISH</th>
</tr>
</thead>
</table>
This command terminates the STAAD run.

Frame with Concrete Design - Page No. 6
### EX. UK-9 Modeling Slabs and Shear Walls Using Finite Elements

The space frame structure in this example consists of frame members and finite elements (plates). The finite element part is used to model floor slabs and a shear wall. Concrete design of an element is performed.

This problem is installed with the program by default to

C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK\UK-9 Modeling Slabs and Shear Walls Using Finite Elements.STD when you install the program.
Application Examples

EX. British Design Examples

Figure 543: Example Problem No. 9

Actual input is shown in bold lettering followed by explanation.

STAAD SPACE
* EXAMPLE PROBLEM WITH FRAME MEMBERS AND FINITE ELEMENTS

Every STAAD input file has to begin with the word STAAD. The word SPACE signifies that the structure is a space frame and the geometry is defined through X, Y and Z axes. The second line forms the title to identify this project.

UNIT METER NEWTON

The units for the data that follows are specified above.

</table>
The joint numbers and their coordinates are defined through the above set of commands. The automatic generation facility has been used several times in the above lines. See TR.11 Joint Coordinates Specification (on page 2193) where the joint coordinate generation facilities are described.

```
MEMBER INCI
*COLUMNS
  1  1  7 ;  2  2 11
  3  3 34 ;  4 34 35 ;  5 35 36 ;  6 36 18
  7  4 37 ;  8 37 38 ;  9 38 39 ; 10 39 22
 11  5 29 ; 12  6 33

*BEAMS IN Z DIRECTION AT X=0
 13  7  8 16

*BEAMS IN Z DIRECTION AT X=6.0
 17 18 19 20

*BEAMS IN Z DIRECTION AT X=12.0
 21 29 30 24

*BEAMS IN X DIRECTION AT Z = 0
 25  7 12 ; 26 12 13 ; 27 13 14 ; 28 14 18
 29 18 23 ; 30 23 24 ; 31 24 25 ; 32 25 29

*BEAMS IN X DIRECTION AT Z = 12.0
 33 11 15 ; 34 15 16 ; 35 16 17 ; 36 17 22
 37 22 26 ; 38 26 27 ; 39 27 28 ; 40 28 33
```

The member incidences are defined through the above set of commands. For some members, the member number followed by the start and end joint numbers are defined. In other cases, STAAD's automatic generation facilities are utilized. Refer to TR.12 Member Incidences Specification (on page 2197) for additional details.

```
DEFINE MESH
  A JOINT  7
  B JOINT 11
  C JOINT 22
  D JOINT 18
  E JOINT 33
  F JOINT 29
  G JOINT  3
  H JOINT  4
```

The above lines define the nodes of super-elements. Super-elements are plate/shell surfaces from which a number of individual plate/shell elements can be generated. In this case, the points describe the outer corners of a slab and that of a shear wall. Our goal is to define the slab and the wall as several plate/shell elements.

```
GENERATE ELEMENT
  MESH ABCD  4  4
  MESH DCEF  4  4
  MESH DCHG  4  4
```

The above lines form the instructions to generate individual 4-noded elements from the super-element profiles. For example, the command MESH ABCD  4  4 means that STAAD.Pro has to generate 16 elements from the surface formed by the points A, B, C and D with 4 elements along the edges AB & CD and 4 elements along the edges BC & DA.

```
UNIT MMS
MEMB PROP
  1 TO 40 PRIS YD 300 ZD 300
```

Members 1 to 40 are defined as a rectangular prismatic section with 300 mm depth and 300 mm width.

```
ELEM PROP
  41 TO 88 TH 150
```
Elements 41 to 88 are defined to be 150 mm thick.

```
DEFINE MATERIAL START
  ISOTROPIC CONCRETE

  POISSON 0.17
  DENSITY 2.36158e-008
  ALPHA 5e-006
  DAMP 0.05
  G 9.25
  TYPE CONCRETE
  STRENGTH FCU 0.0275
END DEFINE MATERIAL
```

The DEFINE MATERIAL command is used to specify material properties and the CONSTANT is used to assign the material to all members.

```
SUPPORT
  1 TO 6 FIXED
```

Joints 1 to 6 are defined as fixed supported.

```
UNIT KNS METER
LOAD 1 DEAD LOAD FROM FLOOR
  ELEMENT LOAD
    41 TO 72 PRESSURE -10.0
```

Load 1 consists of a pressure load of 10 KNS/sq.m. The intensity on elements 41 to 72. The negative sign (and the default value for the axis) indicates that the load acts opposite to the positive direction of the element local z-axis.

```
LOAD 2 WIND LOAD
  JOINT LOAD
    11 33 FZ -90.
    22 FZ -450.
```

Load 2 consists of joint loads in the Z direction at joints 11, 22, and 33.

```
LOAD COMB 3
  1 0.9 2 1.3
```

Load 3 is a combination of 0.9 times load case 1 and 1.3 times load case 2.

```
PERFORM ANALYSIS
```

The command to perform an elastic analysis is specified above.

```
LOAD LIST 1 3
PRINT SUPP REAC
PRINT MEMBER FORCES LIST 27
PRINT ELEMENT STRESSES LIST 47
```

Support reactions, members forces and element stresses are printed for load cases 1 and 3.

```
START CONCRETE DESIGN
  CODE BRITISH
  DESIGN ELEMENT 47
END CONCRETE DESIGN
```
The above set of command form the instructions to STAAD to perform a concrete design on element 47. Design is done according to the British code. Note that design will consist only of flexural reinforcement calculations in the longitudinal and transverse directions of the elements for the moments MX and MY.

FINI

The STAAD run is terminated.

EX. UK-10 Finite Element Model for a Rectangular Tank

A tank structure is modeled with four-noded plate elements. Water pressure from inside is used as loading for the tank. Reinforcement calculations have been done for some elements.

This problem is installed with the program by default to
C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK\UK-10 Finite Element Model for a Rectangular Tank.STD when you install the program.

Figure 544: Tank Model

Figure 545: Deflected Shape

Actual input is shown in bold lettering followed by explanation.

STAAD SPACE FINITE ELEMENT MODEL OF TANK
* STRUCTURE
Every input has to start with the term STAAD. The word SPACE signifies that the structure is a space frame (3-D) structure.

<table>
<thead>
<tr>
<th>UNITS METER KNS</th>
</tr>
</thead>
</table>

Defines the input units for the data that follows.

<table>
<thead>
<tr>

</tr>
<tr>
<td>REPEAT 2 1.5. 0. 0.</td>
</tr>
</tbody>
</table>

Joint number followed by X, Y and Z coordinates are provided above. The REPEAT command generates joint coordinates by repeating the pattern of the previous line of joint coordinates. The number following the REPEAT command is the number of repetitions to be carried out. This is followed by X, Y and Z coordinate increments. See TR.11 Joint Coordinates Specification (on page 2193).

</table>

Element connectivities are input as above by providing the element number followed by joint numbers defining the element. The REPEAT command generates element incidences by repeating the pattern of the previous line of element nodes. The number following the REPEAT command is the number of repetitions to be carried out and that is followed by element and joint number increments. See TR.12 Member Incidences Specification (on page 2197).

| UNIT MMS |
| ELEMENT PROPERTIES |
| 1 TO 80 TH 200.0 |

Element properties are provided by specifying that the elements are 200.0 mm THick.

| DEFINE MATERIAL START |
| ISOTROPIC CONCRETE |
| E 21.0 |
| POISSON 0.17 |
| DENSITY 2.4e-008 |
| ALPHA 5e-006 |
The `DEFINE MATERIAL` command is used to specify material properties and the `CONSTANT` is used to assign the material to all members.

Pinned supports are specified at the joints listed above. No moments will be carried by these supports. The expression `1 TO 76 BY 5` means 1, 6, 11, etc. up to 76.

Load case 1 is initiated. It consists of element loads in the form of uniform pressure (indicated by `PR`) acting along the local z-axis.

Joint displacements for a selected set of nodes and element corner forces for some elements are written in the output file as a result of the above commands. The forces printed are in the global directions at the nodes of the elements. The `LIST` option restricts the print output to that for the joints/elements listed.

The above command initiates concrete design.

Slabs (i.e., elements) 9 and 12 will be designed and the reinforcement requirements obtained. In STAAD, elements are typically designed for the moments `MX` and `MY` at the centroid of the element.

Terminates the concrete design operation.

This command terminates the STAAD run.

**EX. UK-11 Response Spectrum Analysis of a Frame**

Dynamic analysis (Response Spectrum) is performed for a steel structure. Results of a static and dynamic analysis are combined. The combined results are then used for steel design.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK\UK-11 Response Spectrum Analysis of a Frame.STD when you install the program.
Where:

L1 = 3 m, L2 = 6 m
w = 22.5 kN/m
P1 = 25 kN, P2 = 37.5 kN

Actual input is shown in bold lettering followed by explanation.

**STAAD PLANE RESPONSE SPECTRUM ANALYSIS**

Every input has to start with the term STAAD. The term PLANE signifies that the structure is a plane frame structure and the geometry is defined through X and Y axes.

**UNIT METER KNS**

Defines the input units for the data that follows.

<table>
<thead>
<tr>
<th>JOINT COORDINATES</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 0.0 0.0 0.0 ; 2 6.0 0.0 0.0</td>
</tr>
<tr>
<td>3 0.0 3.0 0.0 ; 4 6.0 3.0 0.0</td>
</tr>
<tr>
<td>5 0.0 6.0 0.0 ; 6 6.0 6.0 0.0</td>
</tr>
</tbody>
</table>

Joint number followed by X, Y and Z coordinates are provided above. Since this is a plane structure, the Z coordinates are all the same, in this case, zeros.
Note: Semicolons (;) are used as line separators to allow for input of multiple sets of data on one line.

<table>
<thead>
<tr>
<th>MEMBER INCIDENCES</th>

<tr>
<td>MATERIAL STEEL ALL</td>
</tr>
</tbody>
</table>

Material constants such as E (modulus of elasticity), Poisson’s ratio and density (DEN) are specified above. Length unit is changed from METER to MMS to facilitate the input.

| CUT OFF MODE SHAPE 2 |

The number of mode shapes to be considered in dynamic analysis is set to 2. Without the above command, this will be set to the default. See TR.30.1 Cut-Off Frequency, Mode Shapes, or Time (on page 2319).

<table>
<thead>
<tr>
<th>* LOAD 1 WILL BE STATIC LOAD</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNIT METER</td>
</tr>
<tr>
<td>LOAD 1 DEAD AND LIVE LOADS</td>
</tr>
</tbody>
</table>

Load case 1 is initiated followed by a title. Prior to this, the length unit is changed to METER for specifying distributed member loads. A line starting with an asterisk (*) mark indicates a comment line.

| SELFWEIGHT Y -1.0 |

The above command indicates that the selfweight of the structure acting in the global Y direction is part of this load case. The factor of -1.0 is meant to indicate that the load acts opposite to the positive direction of global Y, hence downwards.

<table>
<thead>
<tr>
<th>MEMBER LOADS</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 CON GY -25.0 1.8</td>
</tr>
<tr>
<td>5 CON GY -37.5 3.0</td>
</tr>
<tr>
<td>5 CON GY -25.0 4.2</td>
</tr>
<tr>
<td>5 6 UNI Y -22.5</td>
</tr>
</tbody>
</table>
Load 1 contains member loads also. GY indicates that the load is in the global Y direction while Y indicates local Y direction. The word UNI stands for uniformly distributed load while CON stands for concentrated load. GY is followed by the value of the load and the distance at which it is applied.

* NEXT LOAD WILL BE RESPONSE SPECTRUM LOAD
* WITH MASSES PROVIDED IN TERMS OF LOAD.
LOAD 2 SEISMIC LOADING

The two lines which begin with the asterisk are comment lines which tell us the purpose of the next load case. Load case 2 is then initiated along with an optional title. This will be a dynamic load case. Permanent masses will be provided in the form of loads. These masses (in terms of loads) will be considered for the eigensolution. Internally, the program converts these loads to masses, hence it is best to specify them as absolute values (without a negative sign). Also, the direction (X, Y, Z etc.) of the loads will correspond to the dynamic degrees of freedom in which the masses are capable of vibrating. In a PLANE frame, only X and Y directions need to be considered. In a SPACE frame, masses (loads) should be provided in all three (X, Y and Z) directions if they are active along all three. The user has the freedom to restrict one or more directions.

SELFWEIGHT X 1.0
SELFWEIGHT Y 1.0

The above commands indicate that the selfweight of the structure acting in the global X and Y directions with a factor of 1.0 is taken into consideration for the mass matrix.

MEMBER LOADS
5 CON GX 25.0 1.8
5 CON GY 25.0 1.8
5 CON GX 37.5 3.0
5 CON GY 37.5 3.0
5 CON GX 25.0 4.2
5 CON GY 25.0 4.2

The mass matrix will also consist of terms derived from the above member loads. GX and GY indicate that the load, and hence the resulting mass, is capable of vibration along the global X and Y directions. The word CON stands for concentrated load. Concentrated forces of 25, 37.5, and 25 kNs are located at 1.8m, 3.0m and 4.2m from the start of member 5.

SPECTRUM CQC EURO X 1.0 ACC DAMP 0.05
SOIL TYPE C ALPHA 0.15 Q 1.5

The SPECTRUM command specifies a Eurocode 8 2004 seismic response spectrum load. The modal responses will be combined using the CQC method. Here, the spectrum effect is in the global X direction with a factor of 1.0. EC8 2004 response spectra are always given in terms of acceleration (ACC). A damping ratio of 0.05 (5%) is used. The second line then gives the soil type along with the alpha ratio and behavior factor, Q.

LOAD COMBINATION 3
1 0.75 2 0.75
LOAD COMBINATION 4
1 0.75 2 -0.75

In a response spectrum analysis, the sign of the forces cannot be determined, and hence are absolute numbers. Consequently, to account for the fact that the force could be positive or negative, it is necessary to create 2 load combination cases. That is what is being done above. Load combination case no. 3 consists of the sum of the static load case (1) with the positive direction of the dynamic load case (2). Load combination case no. 4 consists of the sum of the static load case (1) with the negative direction of the dynamic load case (2). In both cases, the result is factored by 0.75.

PERFORM ANALYSIS PRINT MODE SHAPES
This command instructs the program to proceed with the analysis. The PRINT command instructs the program to print mode shape values.

```
PRINT ANALYSIS RESULTS
```

Displacements, reactions and member forces are recorded in the output file using the above command.

```
LOAD LIST 1 3 4
PARAMETER
CODE EN 1993-1-1:2005
NA 1
SELECT ALL
```

A steel design in the form of a member selection is performed based on the rules of the Eurocode 8 code using the UK national annex. Only the member forces resulting from load cases 1, 3 and 4 will be considered for these calculations.

```
FINISH
```

This command terminates the STAAD run.

FILE SAVE; THEN ANALYZE AGAIN WITHOUT THE GROUP OR SELECT
COMMANDS.
EX. UK-12 Moving Load Generation on a Bridge Deck

This example demonstrates generation of load cases for the type of loading known as a moving load. This type of loading occurs classically when the load-causing units move on the structure, as in the case of trucks on a bridge deck. The mobile loads are discretized into several individual immobile load cases at discrete positions. During this process, enormous number of load cases may be created resulting in plenty of output to be sorted. To avoid looking into a lot of output, the maximum force envelope is requested for a few specific members.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK \UK-12 Moving Load Generation on a Bridge Deck.STD when you install the program.
**Application Examples**

EX. British Design Examples

Where:

L1 = 9 m  
L2 = 1.5 m

Actual input is shown in bold lettering followed by explanation.

<table>
<thead>
<tr>
<th>STAAD FLOOR A SIMPLE BRIDGE DECK</th>
</tr>
</thead>
<tbody>
<tr>
<td>Every input has to start with the term STAAD. The word FLOOR signifies that the structure is a floor structure and the geometry is defined through X and Z axis.</td>
</tr>
<tr>
<td>UNITS METER KNS</td>
</tr>
</tbody>
</table>

*Figure 547: Example Problem No. 12*
Defines the input units for the data that follows.

**JOINT COORDINATES**

<p>| | | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>6</td>
<td>7.5</td>
</tr>
<tr>
<td>R</td>
<td>5</td>
<td>0</td>
<td>0</td>
<td>9</td>
<td>0</td>
</tr>
</tbody>
</table>

Joint number followed by X, Y, and Z coordinates are provided above. Since this is a floor structure, the Y coordinates are all the same (in this case, zero). The first line generates joints 1 through 6. With the repeat (R) command, the coordinates of the next 30 joints are generated by repeating the pattern of the coordinates of the first 6 joints 5 times with X, Y and Z increments of 0, 0, and 9 respectively.

**MEMBER INCIDENCES**

<p>| | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>7</td>
<td>6</td>
</tr>
<tr>
<td>7</td>
<td>1</td>
<td>2</td>
<td>11</td>
</tr>
<tr>
<td>R</td>
<td>A</td>
<td>4</td>
<td>11</td>
</tr>
<tr>
<td>56</td>
<td>31</td>
<td>32</td>
<td>60</td>
</tr>
</tbody>
</table>

Defines the members by the joints to which they are connected. The fourth number indicates the final member number up to which they will be generated. Repeat all (abbreviated as R A) will create members by repeating the member incidence pattern of the previous 11 members. The number of repetitions to be carried out is provided after the RA command and the member increment and joint increment are defined as 11 and 6 respectively. The fifth line of input defines the member incidences for members 56 to 60.

**MEMBER PROPERTIES BRITISH**

<p>| | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>60</td>
<td>TA</td>
<td>ST</td>
</tr>
</tbody>
</table>

Properties for all members are assigned from the British steel table. The word ST stands for standard single section.

**SUPPORTS**

<p>| | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>6</td>
<td>31</td>
<td>36</td>
</tr>
</tbody>
</table>

Pinned supports are specified at the above joints. A pinned support is one which can resist only translational forces.

**UNIT METER KNS**

The **DEFINE MATERIAL** command is used to specify material properties and the **CONSTANTS** is used to assign the material to all members. The units of length are changed from METER to MMS.

**UNIT METER KNS**

The characteristics of the vehicle are defined above in METER and KNS units. The above lines represent the first out of two sets of data required in moving load generation. The type number (1) is a label for identification of the load-causing unit, such as a truck. Three axles (90 90 45) are specified with the LOAD command. The spacing between the axles in the direction of movement (longitudinal direction) is specified after the DISTANCE
command. WIDTH is the spacing in the transverse direction, that is, it is the distance between the 2 prongs of an axle of the truck.

LOAD 1

Load case 1 is initiated.

SELF Y -1.0

Selfweight of the structure acting in the negative (due to the factor -1.0) global Y direction is the only component of load case 1.

LOAD GENERATION 10
TYPE 1 2.25 0.0 0.0 ZI 3.0

This constitutes the second of the two sets of data required for moving load generation. 10 load cases are generated using the Type 1 vehicle whose characteristics were described earlier. For the first of these load cases, the X, Y and Z location of the reference load (see TR.31.1 Definition of Moving Load System (on page 2321) ) have been specified after the command TYPE 1. The Z Increment of 3.0m denotes that the vehicle moves along the Z direction and the individual positions which are 3.0m apart will be used to generate the remaining 9 load cases.

When defining a moving load in STAAD.Pro, the reference wheel is on the last axle. The first load case which is generated will be the one for which the first axle is just about to enter the bridge. The last load case should be the one for which the last axle is just about to exit the bridge. Thus, the total distance travelled by the reference load will be the length of the vehicle (distance from first axle to last axle) plus the span of the bridge. In this problem, that comes to

\[(3.0+1.5) + 45 = 49.5 \text{ m}.\]

This example uses 3.0 m increments and generates 10 load cases.

However, if you want the vehicle to move forward in 4.5 m increments (each 4.5 m increment will create a discrete position of the truck on the bridge), it would required \((49.5/4.5)+1 = 12\) cases to be generated.

PERFORM ANALYSIS PRINT LOAD

The above command instructs the program to proceed with the analysis and print the values and positions of all the generated load cases.

PRINT MAXFORCE ENVELOP LIST 3 41 42

A maximum force envelope consisting of the highest forces for each degree of freedom on the listed members will be written into the output file.

FINISH

This command terminates the STAAD run.

EX. UK-13 Section Displacements for a Frame

Calculation of displacements at intermediate points of members of a plane frame is demonstrated in this example.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK\UK-13 Section Displacements for a Frame.STD when you install the program.

![Figure 548: Example Problem No. 13](image)

Where:

L1 = 4.5 m, L2 = 6.0 m
P = 25 kN
w = 45 kN/m

The dashed line represents the deflected shape of the structure. The shape is generated on the basis of displacements at the ends plus several intermediate points of the members.

Actual input is shown in bold lettering followed by explanation.

<table>
<thead>
<tr>
<th>STAAD PLANE TEST FOR SECTION DISPLACEMENT</th>
</tr>
</thead>
</table>

Every input has to start with the term STAAD. The term PLANE signifies that the structure is a plane frame structure and the geometry is defined through X and Y axes.

<table>
<thead>
<tr>
<th>UNIT METER KNS</th>
</tr>
</thead>
</table>

Defines the input units for the data that follows.

<table>
<thead>
<tr>
<th>JOINT COORDINATES</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 0 0 ; 2 0. 4.5 ; 3 6 4.5 ; 4 6 0.</td>
</tr>
</tbody>
</table>
Joint number followed by X and Y coordinates are provided above. Since this is a plane structure, the Z coordinates need not be provided.

**Note:** Semicolons (;) are used as line separators to allow for input of multiple sets of data on one line.

<table>
<thead>
<tr>
<th>MEMBER INCIDENCE</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 1 2 ; 2 2 3 ; 3 3 4</td>
</tr>
</tbody>
</table>

Defines the members by the joints to which they are connected.

<table>
<thead>
<tr>
<th>MEMBER PROPERTY BRITISH</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 3 TABLE ST UC203X203X46</td>
</tr>
<tr>
<td>2 TABLE ST UB305X165X40</td>
</tr>
</tbody>
</table>

Member properties are specified from the British steel table. The word ST stands for standard single section.

```
UNIT MMS
DEFINE MATERIAL START
ISOTROPIC STEEL
  E 210
  POISSON 0.3
  DENSITY 7.6977e-008
  ALPHA 6e-006
  DAMP 0.03
  TYPE STEEL
  STRENGTH FY 0.25 FU 0.4 RY 1.5 RT 1.2
END DEFINE MATERIAL
CONSTANTS
MATERIAL STEEL ALL
```

The length unit is changed from METER to MMS. The `DEFINE MATERIAL` command is used to specify material properties and the `CONSTANT` is used to assign the material to all members.

<table>
<thead>
<tr>
<th>SUPPORT</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 FIXED ; 4 PINNED</td>
</tr>
</tbody>
</table>

A fixed support is specified at Joint 1 and a pinned support at Joint 4.

<table>
<thead>
<tr>
<th>UNIT METER</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOADING 1 DEAD + LIVE + WIND</td>
</tr>
</tbody>
</table>

Load case 1 is initiated followed by an optional title.

<table>
<thead>
<tr>
<th>JOINT LOAD</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 FX 25.0</td>
</tr>
</tbody>
</table>

Load 1 contains a joint load of 25KN at node 2. FX indicates that the load is a force in the global X direction.

<table>
<thead>
<tr>
<th>MEMBER LOAD</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 UNI GY -45.0</td>
</tr>
</tbody>
</table>

Load 1 contains a member load also. GY indicates that the load is in the global Y direction. The word UNI stands for uniformly distributed load.

```
PERFORM ANALYSIS
```

This command instructs the program to proceed with the analysis.

<table>
<thead>
<tr>
<th>PRINT MEMBER FORCES</th>
</tr>
</thead>
</table>

The above PRINT command is self-explanatory.
* DISPLACEMENTS OF THE MEMBERS
* CONSIDERING EVERY TWELFTH INTERMEDIATE
* POINT (THAT IS TOTAL OF 13 POINTS). THESE
* DISPLACEMENTS ARE MEASURED IN GLOBAL X
* Y Z COORDINATE SYSTEM AND THE VALUES

### EX. UK-14 P-Delta Analysis of a Frame Under Seismic Loads

A space frame is analyzed for seismic loads. The seismic loads are generated using the procedures of the building code. A P-Delta analysis is performed to obtain the secondary effects of the lateral and vertical loads acting simultaneously.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK \UK-14 P-Delta Analysis of a Frame Under Seismic Loads.STD when you install the program.

STAAD SPACE EXAMPLE PROBLEM FOR UBC LOAD

Every input has to start with the term STAAD. The word SPACE signifies that the structure is a space frame.

UNIT METER KNS

Defines the input units for the data that follows.

JOINT COORDINATES
1 0 0 4 10.5 0 0
REPEAT 3 0 0 3.5
REPEAT ALL 3 0 3.5 0

The X, Y and Z coordinates of the joints are specified here. First, coordinates of joints 1 through 4 are generated by taking advantage of the fact that they are equally spaced. Then, this pattern is REPEATED 3 times with a Z increment of 3.5 m for each repetition to generate joints 5 to 16. The REPEAT ALL command will then repeat 3 times, the pattern of joints 1 to 16 to generate joints 17 to 64.

MEMBER INCIDENCES
* beams in x direction
101 17 18 103
104 21 22 106
107 25 26 109

Figure 549: Example Problem No. 14
110 29 30 112
REPEAT ALL 2 12 16
* beams in z direction
201 17 21 204
205 21 25 208
209 25 29 212
REPEAT ALL 2 12 16
* columns
301 1 17 348

Defines the members by the joints to which they are connected. Following the specification of incidences for members 101 to 112, the REPEAT ALL command is used to repeat the pattern and generate incidences for members 113 through 136. A similar logic is used in specification of incidences of members 201 through 212 and generation of incidences for members 213 to 236. Finally, members incidences of columns 301 to 348 are specified.

MEMBER PROPERTIES BRITISH
101 TO 136 201 TO 236 PRIS YD 0.40 ZD 0.30
301 TO 348 TA ST UB457X152X52

The beam members have prismatic member property specification (YD & ZD) while the columns (members 301 to 348) have their properties called from the built-in British steel table.

UNIT METER

The DEFINE MATERIAL command is used to specify material properties and the CONSTANT is used to assign the material to all members.

Tip: You may see these values with the help of the command PRINT MATERIAL PROPERTIES following the preceding commands.

SUPPORT
1 TO 16 FIXED
Indicates the joints where the supports are located as well as the type of support restraints.

```plaintext
DEFINE UBC LOAD
ZONE 0.2 I 1.0 RwX 9 RwZ 9 S 1.5 CT 0.032
SELFWEIGHT
JOINT WEIGHT
17 TO 48 WEIGHT 7.0
49 TO 64 WEIGHT 3.5
```

There are two stages in a static seismic load. The first stage is to define the code-specified load parameters along with the vertical loads (weights) from which the base shear will be calculated. The vertical loads may be specified in the form of selfweight, joint weights and/or member weights. Member weights are not shown in this example. It is important to note that these vertical loads are used purely in the determination of the horizontal base shear only. In other words, the structure is not analyzed for these vertical loads.

```plaintext
LOAD 1
UBC LOAD X 0.75
SELFWEIGHT Y -1.0
JOINT LOADS
17 TO 48 FY -7.0
49 TO 64 FY -3.5
```

This is the second stage in which the static seismic load is applied with the help of a load case number, corresponding direction (X in the above case) and a factor by which the generated horizontal loads should be multiplied. Along with the seismic lateral load, deadweight is also added to the same load case. Since we will be doing second-order (PDELTA) analysis, it is important that we include horizontal and vertical loads in the same load case.

```plaintext
LOAD 2
UBC LOAD Z 0.75
SELFWEIGHT Y -1.0
JOINT LOADS
17 TO 48 FY -7.0
49 TO 64 FY -3.5
```

In load case 2, the static seismic load is being applied in the Z direction. Vertical loads are part of this case, also.

```plaintext
PDELTA ANALYSIS PRINT LOAD DATA
```

We are requesting a second-order analysis by specifying the command PDELTA ANALYSIS. PRINT LOAD DATA is used to obtain a report of all the applied and generated loadings.

```plaintext
PRINT SUPPORT REACTIONS
FINISH
```

The above commands are self-explanatory.

**EXAMPLE PROBLEM FOR UBC LOAD**
This problem is installed with the program by default to
C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK\UK-15 Wind and Floor Load Generation on a Space Frame.STD when you install the program.

STAAD SPACE - WIND AND FLOOR LOAD GENERATION

This is a space frame analysis problem. Every STAAD input has to start with the command STAAD. The SPACE specification is used to denote a space (3D) frame.

UNIT METER KNS

The UNIT specification is used to specify the length and/or force units to be used.

JOINT COORDINATES
1 0 0 0
2 4 0 0
3 9 0 0
4 0 0 4
5 4 0 4
6 0 0 8
7 4 0 8
8 9 0 8
REPEAT ALL 2 0 3.5 0

Figure 550: Example Problem No. 15
The **JOINT COORDINATE** specification is used to specify the X, Y, and Z coordinates of the joints. Note that the **REPEAT ALL** command has been used to generate joints for the two upper stories each with a Y increment of 3.5 m.

```
MEMBER INCIDENCES

CONSTANTS
MATERIAL STEEL ALL
UNIT METER
```

The **DEFINE MATERIAL** command is used to specify material properties and the **CONSTANT** is used to assign the material to all members.

```
SUPPORT
  1 TO 8 FIXED BUT MX MZ
```

The supports of the structure are defined through the **SUPPORT** specification. Here all the supports are **FIXED** with releases specified in the **MX** (rotation about global X-axis) and **MZ** (rotation about global Z-axis) directions.

```
DEFINE WIND LOAD
  TYPE 1
  INTENSITY 1.0 1.5 HEIGHT 3.5 7.0
  EXPOSURE 0.90 YRANGE 6.0 8.0
  EXPOSURE 0.85 JOINT 9 12 14
```

When a structure has to be analyzed for wind loading, the engineer is confronted with the task of first converting an abstract quantity like wind velocity or wind pressure into concentrated loads at joints, distributed loads on members, or pressure loads on plates. The large number of calculations involved in this conversion can be
avoided by making use of STAAD's wind load generation utility. This utility takes wind pressure at various heights as the input, and converts them to values that can then be used as concentrated forces known as joint loads in specific load cases. The input specification is done in two stages. The first stage is initiated above through the DEFINE WIND LOAD command. The basic parameters of the WIND loading are specified here. All values need to be provided in the current UNIT system. Each wind category is identified with a TYPE number (an identification mark) which is used later to specify load cases.

In this example, two different wind intensities (1.0 KN/sq. m and 1.5 KN/sq. m) are specified for two different height zones (0 to 3.5m and 3.5 to 7.0m). The EXPOSURE specification is used to mitigate or magnify the effect at specific nodes due to special considerations like openings in the structure. In this case, two different exposure factors are specified. The first EXPOSURE specification specifies the exposure factor as 0.9 for all joints within the height range (defined as global Y-range) of 6.0m – 8.0m. The second EXPOSURE specification specifies the exposure factor as 0.85 for joints 9, 12 and 14. In the EXPOSURE factor specification, the joints may be specified directly or through a vertical range specification.

This is the second stage of input specification for the wind load generation. The term WIND LOAD and the direction term that follows are used to specify the wind loading in a particular lateral direction. In this case, WIND loading TYPE 1, defined previously, is being applied in the global X-direction with a positive multiplication factor of 1.2.

In load case 2 in this problem, a floor load generation is performed. In a floor load generation, a pressure load (force per unit area) is converted by the program into specific points forces and distributed forces on the members located in that region. The YRANGE, XRANGE, and ZRANGE specifications are used to define the area of the structure on which the pressure is acting. The FLOAD specification is used to specify the value of that pressure. All values need to be provided in the current UNIT system. For example, in the first line in the above FLOOR LOAD specification, the region is defined as being located within the bounds YRANGE of 3.4 – 3.6 m, XRANGE of 0.0 - 4.0 m and ZRANGE of 0.0 - 8.0 m. The -5.0 signifies that the pressure is 5.0 KN/sq.m. in the negative global Y direction.

The program will identify the members lying within the specified region and derive member loads on these members based on two-way load distribution.

We can view the values and position of the generated loads with the help of the PRINT LOAD DATA command used above along with the PERFORM ANALYSIS command.

Above commands are self-explanatory.

59. Print Support Reaction

**Support Reaction**

- Wind and Floor Load Generation

---

### Application Examples

**EX. British Design Examples**
EX. UK-16 Time History Analysis for Forcing Function and Ground Motion

Dynamic Analysis (Time History) is performed for a 3 span beam with concentrated and distributed masses. The structure is subjected to “forcing function” and “ground motion” loading. The maxima of joint displacements, member end forces and support reactions are determined.

This problem is installed with the program by default to
C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK\UK-16 Time History Analysis for Forcing Function and Ground Motion.STD when you install the program.
Figure 551: Example Problem No. 16

Where:

L1 = 1.2 m

STAAD PLANE EXAMPLE FOR TIME HISTORY ANALYSIS

Every input file has to start with the word STAAD. The term PLANE signifies that the structure is a plane frame.

UNIT CMS KNS

Specifies the units to be used.

JOINT COORDINATES
1 0.0 0.0 0.0
2 0.0 120.0 0.0
3 0.0 240.0 0.0
4 0.0 360.0 0.0

Joint number followed by the X, Y and Z coordinates are specified above.

MEMBER INCIDENCES
1 1 2 3

Incidences of members 1 to 3 are specified above.

MEMBER PROPERTIES
1 2 3 PRIS AX 100.0 IZ 833.33
All the members have PRISMATIC property specification. Since this is a plane frame, Area of cross section (\(AX\)) and Moment of Inertia (\(IZ\)) about the Z axis are adequate for the analysis.

<table>
<thead>
<tr>
<th>SUPPORTS</th>

</tr>
<tr>
<td>MATERIAL CONCRETE ALL</td>
</tr>
</tbody>
</table>

The DEFINE MATERIAL command is used to specify material properties and the CONSTANT is used to assign the material to all members.

<table>

</tr>
<tr>
<td>ARRIVAL TIMES</td>
</tr>
<tr>
<td>0.0</td>
</tr>
<tr>
<td>DAMPING 0.075</td>
</tr>
</tbody>
</table>

There are two stages in the command specification required for a time history analysis. The first stage is defined above. First the characteristics of the time varying load are provided. The loading type may be a forcing function (vibrating machinery) or ground motion (earthquake). The former is input in the form of time-force pairs while the latter is in the form of time-acceleration pairs. Following this data, all possible arrival times for these loads on the structure as well as the modal damping ratio are specified. In this example, the damping ratio is the same (7.5%) for all modes.

<table>
<thead>
<tr>
<th>LOAD 1 STATIC LOAD</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER LOAD 1 2 3 UNI GX 500.0</td>
</tr>
</tbody>
</table>

Load case 1 above is a static load. A uniformly distributed force of 500 Newton/m acts along the global X direction on all 3 members.

<table>
<thead>
<tr>
<th>LOAD 2 TIME HISTORY LOAD</th>
</tr>
</thead>
<tbody>
<tr>
<td>SELFWEIGHT X 1.0</td>
</tr>
<tr>
<td>SELFWEIGHT Y 1.0</td>
</tr>
<tr>
<td>JOINT LOAD 2 3 FX 4000.0</td>
</tr>
<tr>
<td>TIME LOAD 2 3 FX 1 1</td>
</tr>
<tr>
<td>GROUND MOTION X 2 1</td>
</tr>
</tbody>
</table>

This is the second stage in the command specification for time history analysis. This involves the application of the time varying load on the structure. The masses that constitute the mass matrix of the structure are specified.
through the selfweight and joint load commands. The program will extract the lumped masses from these weights. Following that, both the TIME LOAD and GROUND MOTION are applied simultaneously.

**Note:** This example is only for illustration purposes and that it may be unlikely that a TIME LOAD and GROUND MOTION both act on the structure at the same time.

The Time load command is used to apply the Type 1 force, acting in the global X direction, at arrival time number 1, at nodes 2 and 3. The Ground motion, namely, the Type 2 time history loading, is also in the global X direction at arrival time 1.

**PERFORM ANALYSIS**

The above command initiates the analysis process.

**PRINT JOINT DISPLACEMENTS**

During the analysis, the program calculates joint displacements for every time step. The absolute maximum value of the displacement for every joint is then extracted from this joint displacement history. So, the value printed using the above command is the absolute maximum value for each of the six degrees of freedom at each node.

**UNIT KNS METER**
**PRINT MEMBER FORCES**
**PRINT SUPPORT REACTION**

The member forces and support reactions too are calculated for every time step. For each degree of freedom, the maximum value of the member force and support reaction is extracted from these histories and reported in the output file using the above command.

**FINISH**

**EX. UK-17 User-Provided Tables**

The usage of user-provided steel tables is illustrated in this example for the analysis and design of a plane frame. User-provided tables allow you to specify property data for sections not found in the built-in steel section tables.

This problem is installed with the program by default to

C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK\UK-17 User-Provided Tables.STD when you install the program.
Where:

\[ L_1 = 4.5 \text{ m}, \quad L_2 = 6.0 \text{ m} \]
\[ P = 25 \text{ kN} \]
\[ w = 45 \text{ kN/m} \]

Actual input is shown in bold lettering followed by explanation.

STAAD PLANE EXAMPLE FOR USER TABLE

Every input file has to start with the command STAAD. The PLANE command is used to designate the structure as a plane frame.

UNIT METER KNS
The UNIT command sets the length and force units to be used.

<table>
<thead>
<tr>
<th>JOINT COORDINATES</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 0 0 ; 2 9 0 ; 3 0 6 0 6 9 6 0</td>
</tr>
<tr>
<td>7 0 10.5 ; 8 9 10.5 ; 9 2.25 10.5 ; 10 6.75 10.5</td>
</tr>
<tr>
<td>11 4.5 10.5 ; 12 1.5 11.4 ; 13 7.5 11.4</td>
</tr>
<tr>
<td>14 3.0 12.3 ; 15 6.0 12.3 ; 16 4.5 13.2</td>
</tr>
</tbody>
</table>

The above set of data is used to provide joint coordinates for the various joints of the structure. The Cartesian system is being used here. The data consists of the joint number followed by global X and Y coordinates. Note that for a space frame, the Z coordinate(s) need to be provided also.

**Note:** Semicolons (;) are used as line separators to allow for input of multiple sets of data on one line.

<table>
<thead>
<tr>
<th>MEMBER INCIDENCES</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 1 3 ; 2 3 7 ; 3 2 6 ; 4 6 8 ; 5 3 4</td>
</tr>
<tr>
<td>6 4 5 ; 7 5 6 ; 8 7 12 ; 9 12 14</td>
</tr>
<tr>
<td>10 14 16 ; 11 15 16 ; 12 13 15 ; 13 8 13</td>
</tr>
<tr>
<td>14 9 12 ; 15 9 14 ; 16 11 14 ; 17 11 15</td>
</tr>
<tr>
<td>18 10 15 ; 19 10 13 ; 20 7 9</td>
</tr>
<tr>
<td>21 9 11 ; 22 10 11 ; 23 8 10</td>
</tr>
</tbody>
</table>

The above data set contains the member incidence information or the joint connectivity data for each member. This completes the geometry of the structure.

**START USER TABLE**

This command is utilized to set up a user-provided steel table. All user-provided steel tables must start with this command.

**TABLE 1**

Each table needs an unique numerical identification. The above command starts setting up Table no. 1. Up to twenty tables may be specified per run.

| UNIT CM |
| WIDE FLANGE |

This command is used to specify the section-type as WIDE FLANGE in this table. Note that several section-types such as WIDE FLANGE, CHANNEL, ANGLE, TEE etc. are available for specification (see TR.19 User Steel Table Specification (on page 2216)).

| BEAM250 |
| 32.2 25.5 0.6 10.2 0.85 3400 150 6.2 15.7 15.4 |
| BEAM300 |
| 47.5 30.4 0.72 12.4 1.07 7160 335 14.3 21.9 23.8 |
| BEAM350 |
| 64.6 35.6 0.73 17.2 1.15 14150 970 22.8 26.0 35.5 |

The above data set is used to specify the properties of three wide flange sections. The data for each section consists of two parts. In the first line, the section-name is provided. You are allowed to provide any section name within twelve characters. The second line contains the section properties required for the particular section-type. Each section-type requires a certain number of data (area of cross-section, depth, moment of inertias etc.) provided in a certain order. For example, in this case, for wide flanges, ten different properties are required.

| TABLE 2 |
| UNIT CM |
| ANGLES |
| L30305 |
| 3.0 3.0 0.5 0.58 1.0 1.0 |
| L40405 |
The above command and data lines set up another user provided table consisting of angle sections.

**MEMBER PROPERTIES**

```
1 3 4 UPT 1 BEAM350
2 UPT 1 BEAM300 ; 5 6 7 UPT 1 BEAM250
8 TO 13 UPT 1 BEAM250
14 TO 19 UPT 2 L30305
20 TO 23 UPT 2 L40405
```

In the above command lines, the member properties are being assigned from the user provided tables created earlier. The word UPT signifies that the properties are from the user-provided table. This is followed by the table number and then the section name as specified in the user-provided table. The numbers 1 or 2 following the word UPT indicate the table from which section names are fetched.

**MEMBER TRUSS**

```
14 TO 23
```

The above command is used to designate members 14 to 23 as truss members.

**MEMBER RELEASE**

```
5 START MZ
```

The MEMBER RELEASE command is used to release the MZ moment at the start joint of member no. 5.

```
UNIT MMS
DEFINE MATERIAL START
ISOTROPIC STEEL
E 210
POISSON 0.3
DENSITY 7.68e-008
ALPHA 6e-006
DAMP 0.03
TYPE STEEL
STRENGTH FY 0.25 FU 0.4 RY 1.5 RT 1.2
END DEFINE MATERIAL
CONSTANTS
MATERIAL STEEL ALL
BETA 90.0 MEMB 3 4
```

The above command set is used to specify modulus of elasticity, density, Poisson’s ratio and beta angle values. Built-in default value of steel is used for the material constants.

**UNIT KNS METER**

The force unit is reset to KNS, and length unit to METER using this command.

**SUPPORT**

```
1 FIXED ; 2 PINNED
```

The above command set is used to designate supports. Here, joint 1 is designated as a fixed support and joint 2 is designated as a pinned support.

**LOADING**

```
1 DEAD AND LIVE LOAD
SELFWEIGHT Y -1.0
```
The above command set is used to specify the loadings on the structure. In this case, dead and live loads are provided through load case 1. It consists of selfweight, concentrated loads at joints 4, 5 and 11, and distributed loads on some members.

PERFORM ANALYSIS

This command instructs the program to execute the analysis at this point.

PARAMETER
CODE EN 1993-1-1:2005
NA 1
BEAM 1.0 ALL
NSF 0.85 ALL
KY 1.2 MEMB 3 4

The above commands are used to specify parameters for steel design.

CHECK CODE MEMBER 3 19
SELECT MEMBER 20

This command will perform a code check on members 3 and 19 per the Eurocode 3 steel design code with the UK National Annex. A member selection too is performed for member 20. For each member, the member selection will be performed from the table that was originally used for the specification of the member property. In this case, the selection will be from the respective user tables from which the properties were initially assigned. It may be noted that properties may be provided (and selection may be performed) from built-in steel tables and user provided tables in the same data file.

FINISH

This command terminates a STAAD run.

Figure 553: Example Problem No. 18

Where:

L = 3 m

Fixed Supports at Joints 1, 2, 3, 4, 5, 9, 13
Load intensity = 2000 Kn/sq.m in -Y direction

Actual input is shown in bold lettering followed by explanation.

STAAD SPACE SAMPLE CALCULATION FOR * ELEMENT STRESSES

Every input has to start with the term STAAD. The word SPACE signifies that the structure is a space frame (3-D structure).

UNIT METER KNS

Defines the input units for the data that follows.

JOINT COORDINATES
1 0 0 4 9 0 0
REPEAT 3 0 0 3

Joint number followed by X, Y and Z coordinates are provided above. The REPEAT command is used to generate coordinates of joints 5 to 16 based on the pattern of joints 1 to 4.

ELEMENT INCIDENCE
1 1 5 6 2 TO 3
REPEAT 2 3 4
Element connectivities of elements 1 to 3 are defined first, based on which, the connectivities of elements 4 to 9 are generated.

```
ELEMENT PROPERTIES
1 TO 9 THICK 0.25
```

Elements 1 to 9 have a thickness of 0.25 m.

```
UNIT MMS
DEFINE MATERIAL START
  ISOTROPIC CONCRETE
  E 21.0
  POISSON 0.17
  DENSITY 2.36158e-008
  ALPHA 5e-006
  DAMP 0.05
  G 9.25
  TYPE CONCRETE
  STRENGTH FCU 0.0275
END DEFINE MATERIAL
CONSTANTS
MATERIAL CONCRETE ALL
UNIT METER
```

The **DEFINE MATERIAL** command is used to specify material properties and the **CONSTANT** is used to assign the material to all members.

```
SUPPORT
1 TO 4 5 9 13 FIXED
```

Fixed support conditions exist at the above mentioned joints.

```
LOAD 1
  ELEMENT LOAD
1 TO 9 PRESSURE -2000.0
```

A uniform pressure of 2000 Kn/sq.m is applied on all the elements. In the absence of an explicit direction specification, the load is assumed to act along the local Z axis. The negative value indicates that the load acts opposite to the positive direction of the local Z.

```
PERFORM ANALYSIS
```

The above command instructs the program to proceed with the analysis.

```
PRINT SUPPORT REACTION
```

The above command is self-explanatory.

```
UNIT MMS
PRINT ELEMENT STRESSES LIST 4
```

Element stresses at the centroid of the element are printed using the above command. The output includes membrane stresses, shear stresses, bending moments per unit width and principal stresses. The change of length unit from meter to mms indicates that the values will be printed in KN and MMs units.

```
FINISH
```

The STAAD run is terminated.

**Calculation of principal stresses for element 4**

Calculations are presented for the top surface only.
\[ SX = 0.0 \text{kN/mm}^2 \]
\[ SY = 0.0 \text{kN/mm}^2 \]
\[ SXY = 0.0 \text{kN/mm}^2 \]
\[ MX = 2,111.84 \text{kN-mm/mm} \]
\[ MY = 10,726.22 \text{kN-mm/m} \]
\[ MXY = 4,553.97 \text{kN-mm/mm} \]
\[ S = \frac{1}{6t^2} = \frac{1}{(6 \times 250^2)} = 10,416.67 \text{mm}^2 \text{(Section Modulus)} \]
\[ \sigma_x = SX + MX/S = 0.0 + 2,111.84/10,416.67 = 0.2027 \text{kN/mm} \]
\[ \sigma_y = SY + MY/S = 0.0 + 10,726.22/10,416.67 = 1.0297 \text{kN/mm} \]
\[ \tau_{xy} = SXY + MXY/S = 0.0 + 4,553.97/10,416.67 = 0.4372 \text{kN/mm} \]
\[ T_{Max} = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} = \sqrt{\left(\frac{0.2027 - 1.0297}{2}\right)^2 + 0.4372^2} = 0.6018 \text{KN/mm}^2 \]
\[ S_{Max} = (\sigma_x + \sigma_y)/2 + T_{Max} = (0.2027 + 1.0297)/2 + 0.6018 = 1.218 \text{kN/mm}^2 \]
Say 1.22 kN/mm^2
\[ S_{Min} = (\sigma_x + \sigma_y)/2 - T_{Max} = (0.2027 + 1.0297)/2 - 0.6018 = 0.0144 \text{kN/mm}^2 \]
Say 0.01 kN/mm^2
\[ \text{Angle} = \frac{1}{2}\tan^{-1}\left(\frac{2\tau_{xy}}{\sigma_x - \sigma_y}\right) = \frac{1}{2}\tan^{-1}\left(\frac{2(0.4372)}{0.2027 - 1.0297}\right) = -23.30^\circ \]
\[ \text{VON} = 0.707\sqrt{(S_{Max} - S_{Min})^2 + S_{Max}^2 + S_{Min}^2} = 0.707\sqrt{(1.218 - 0.0144)^2 + 1.218^2 + 0.0144^2} = 1.2107 \text{kN/mm}^2 \]

EX. UK-19 Inclined Supports

This example demonstrates the usage of inclined supports. The word INCLINED refers to the fact that the restraints at a joint where such a support is specified are along a user-specified axis system instead of along the default directions of the global axis system. STAAD.Pro offers a few different methods for assigning inclined supports, and we examine those in this example.

This problem is installed with the program by default to
C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK\UK-19 Inclined Supports.STD when you install the program.

![Figure 554: Example Problem No. 19](image)

Actual input is shown in bold lettering followed by explanation.

```
STAAD SPACE
INPUT WIDTH 79

UNIT METER KN

JOINT COORDINATES
1 0 5 0; 2 10 5 10; 3 20 5 20; 4 30 5 30; 5 5 0 5; 6 25 0 25;
```

Joint number followed by X, Y and Z coordinates are provided above.
Note: Semicolons (;) are used as line separators to allow for input of multiple sets of data on one line.

MEMBER INCIDENCES
1 1 2; 2 2 3; 3 3 4; 4 5 2; 5 6 3;

Defines the members by the joints to which they are connected.

UNIT MMS KN
MEMBER PROPERTY AMERICAN
4 5 PRIS YD 800
1 TO 3 PRIS YD 750 ZD 500

Properties for all members of the model are provided using the PRISMATIC option (abbreviated to PRIS here). YD and ZD stand for depth and width. If ZD is not provided, a circular shape with diameter = YD is assumed for that cross section. All properties required for the analysis, such as, Area, Moments of Inertia, etc. are calculated automatically from these dimensions unless these are explicitly defined. The values are provided in MMS unit.

Material constants like E (modulus of elasticity) and Poisson’s ratio are specified following the command CONSTANTS.

UNIT METER KN
SUPPORTS
5 INCLINED REF 10 5 10 FIXED BUT MX MY MZ KFX 30000
6 INCLINED REFJT 3 FIXED BUT MX MY MZ KFX 30000
1 PINNED
4 INCLINED 1 0 1 FIXED BUT FX MX MY MZ

We assign supports (restraints) at 4 nodes - 5, 6, 1 and 4. For 3 of those, namely, 5, 6 and 4, the node number is followed by the keyword INCLINED, signifying that an INCLINED support is defined there. For the remaining one - node 1 - that keyword is missing. Hence, the support at node 1 is a global direction support.

The most important aspect of inclined supports is their axis system. Each node where an inclined support is defined has its own distinct local X, local Y and local Z axes. In order to define the axis system, we first have to define a datum point. The support node and the datum point together help define the axis system.

Three different methods are shown in the above 3 instances for defining the datum point.

- At node 5, notice the keyword REF followed by the numbers (10,5,10). This means that the datum point associated with node 5 is one which has the global coordinates of (10m, 5m, 10m). Coincidently, this happens to be node 2.
- At node 6, the keyword REFJT is used followed by the number 3. This means that the datum point for support node 6 is the joint number 3 of the model. The coordinates of the datum point are hence those of node 3, namely, (20m, 5m and 20m).
At node 4, the word INCLINED is merely followed by 3 numbers (1,0,1). In the absence of the words REF and REFJT, the program sets the datum point to be the following. It takes the coordinates of node 4, which are (30m,5m,30m) and adds to them, the 3 numbers which comes after the word INCLINED. Thus, the datum point becomes (31m, 5m and 31m).

Once the datum point is established, the local axis system is defined as follows. Local X is a straight line (vector) pointing from the support node towards the datum point. Local Z is the vector obtained by the cross product of local X and the global Y axis (unless the SET Z UP command is used in which case one would use global Z instead of global Y and that would yield local Y). Local Y is the vector resulting from the cross product of local Z and local X. The right hand rule must be used when performing these cross products.

Notice the unique nature of these datum points. The one for node 5 tells us that a line connecting nodes 5 to 2 is the local X axis, and is hence along the axis of member 4. By defining a KFX spring at that one, we are saying that the lower end of member 4 can move along its axis like the piston of a car engine. Think of a pile bored into rock with a certain amount of freedom to expand and contract axially.

The same is true for the support at the bottom of member 5. The local X axis of that support is along the axis of member 5. That also happens to be the case for the supported end of member 3. The line going from node 4 to the datum point (31,5,31) happens to be coincident with the axis of the member, or the traffic direction. The expression FIXED BUT FX MX MY MZ for that support indicates that it is free to translate along local X, suggesting that it is an expansion joint - free to expand or contract along the axis of member 3.

Since MX, MY, and MZ are all released at these supports, no moment will be resisted by these supports.

| LOAD 1 DEAD LOAD |
| SELFWEIGHT Y -1.2 |
| LOAD 2 LIVE LOAD |
| MEMBER LOAD 1 TO 3 UNI GY -6 |
| LOAD COMB 3 1 1.0 2 1.0 |
| PERFORM ANALYSIS PRINT STATICS CHECK |

Three load cases followed by the instruction for the type of analysis are specified. The PRINT STATICS CHECK option will instruct the program to produce a report consisting of total applied load versus total reactions from the supports for each primary load case.

| PRINT SUPPORT REACTION |

By default, support reactions are printed in the global axis directions. The above command is an instruction for such a report.

| SET INCLINED REACTION |
| PRINT SUPPORT REACTION |

Just earlier, we saw how to obtain support reactions in the global axis system. What if we need them in the inclined axis system? The “SET INCLINED REACTION” is a switch for that purpose. It tells the program that reactions should be reported in the inclined axis system instead of the global axis system. This has to be followed by the PRINT SUPPORT REACTIONS command.

| PRINT MEMBER FORCES |
| PRINT JOINT DISP |
| FINISH |

Member forces are reported in the local axis system of the members. Joint displacements at all joints are reported in the global axis system. Following this, the STAAD run is terminated.

EX. UK-20 Generating a Structure in Cylindrical Coordinates

This example generates the geometry of a cylindrical tank structure using the cylindrical coordinate system. The tank lies on its side in this example.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK \UK-20 Generating a Structure in Cylindrical Coordinates.STD when you install the program.

In this example, a cylindrical tank is modeled using finite elements. The radial direction is in the XY plane and longitudinal direction is along the Z-axis. Hence, the coordinates in the XY plane are generated using the cylindrical coordinate system.

| STAAD SPACE |
| UNIT METER KN |

The above command instructs the program that the coordinate data that follows is in the cylindrical coordinate system (r,theta,z).
Joint 1 has an 'r' of 3.5 meters, theta of 0 degrees and Z of 0 ft. Joint 8 has an 'r' of 3.5 meters, theta of 315 degrees and Z of 0 ft. The 315 degrees angle is measured counter-clockwise from the +ve direction of the X-axis. Joints 2 to 7 are generated by equal increments of the coordinate values between joints 1 and 8.

```
REPEAT 2 0 0 3.0
```

The REPEAT command is used to generate joints 9 through 24 by repeating twice, the pattern of joints 1 to 8 at Z-increments of 3.0 meters for each REPEAT.

```
PRINT JOINT COORD
```

The above command is used to produce a report consisting of the coordinates of all the joints in the Cartesian coordinate system. Note that even though the input data was in the cylindrical coordinate system, the output is in the Cartesian coordinate system.

```
ELEMENT INCIDENCES
  1 2 10 9 TO 7 1 1
  8 8 1 9 16
REPEAT ALL 1 8 8
```

The above 4 lines identify the element incidences of all 16 elements. Incidences of element 1 is defined as 1 2 10 9. Incidences of element 2 is generated by incrementing the joint numbers of element 1 by 1, incidences of element 3 is generated by incrementing the incidences of element 2 by 1 and so on up to element 7. Incidences of element 8 has been defined above as 8 1 9 16. The REPEAT ALL command states that the pattern of all the elements defined by the previous 2 lines, namely elements 1 to 8, must be repeated once with an element number increment of 8 and a joint number increment of 8 to generate elements 9 through 16.

```
PRINT ELEMENT INFO
```

The above command is self-explanatory.

```

EX. UK-21 Analysis of a Structure with Tension-Only Members

This example illustrates the modeling of tension-only members using the MEMBER TENSION command.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK\UK-21 Analysis of a Structure with Tension-Only Members.STD when you install the program.

It is important to note that the analysis can be done for only 1 load case at a time. This is because, the set of "active" members (and hence the stiffness matrix) is load case dependent.

where:

\[ L = 5.25 \text{ m}, \quad H = 3.5 \text{ m} \]

Load case 1: \( \text{P}1 = 45 \text{ kN} \) & \( \text{P}2 = 70 \text{ kN} \)
Load case 2: \( \text{P}3 = -45 \text{ kN} \) & \( \text{P}4 = -70 \text{ kN} \)
The input data is initiated with the word STAAD. This structure is a PLANE frame.

UNIT METER KNS

Units for the commands to follow are defined above.

JOINT COORDINATES  
1 0 0 ; 2 0 3.5 ; 3 0 7.0 ; 4 5.25 7.0 ; 5 5.25 3.5 ; 6 5.25 0

Joint coordinates of joints 1 to 6 are defined above.

MEMBER INCIDENCES  
1 1 2 5  
6 1 5 ; 7 2 6 ; 8 2 4 ; 9 3 5 ; 10 2 5

Incidences of members 1 to 10 are defined.

MEMBER TENSION  
6 TO 9

Members 6 to 9 are defined as tension-only members using the MEMBER TENSION command. Hence for each load case, if during the analysis, any of the members 6 to 9 is found to be carrying a compressive force, it is disabled from the structure and the analysis is carried out again with the modified structure.

MEMBER PROPERTY BRITISH  
1 TO 10 TA ST UC152X152X30

All members have been assigned a UC section from the British table.

UNIT MMS
DEFINE MATERIAL START  
ISOTROPIC STEEL  
E 210  
POISSON 0.3

### Member End Forces - Unit KNS MMS

**Structure Type = Plane**

All units are -- KNS MMS (Local).
## Application Examples

### EX. British Design Examples

**EX. UK-22 Time History Analysis for Sinusoidal Loading**

A space frame structure is subjected to a sinusoidal (dynamic) loading. The commands necessary to describe the sine function are demonstrated in this example. Time History analysis is performed on this model.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK\UK-22 Time History Analysis for Sinusoidal Loading.STD when you install the program.
STAAD SPACE

*EXAMPLE FOR HARMONIC LOADING GENERATOR

Every STAAD input file has to begin with the word STAAD.

The word SPACE signifies that the structure is a space frame and the geometry is defined through X, Y, and Z axes. The comment line which begins with an asterisk is an optional title to identify this project.

UNIT KNS METER

The units for the data that follows are specified above.

JOINT COORDINATES
1 0 0 0 ; 2 5 0 0 ; 3 5 0 5 ; 4 0 0 5
5 0 7 0 ; 6 2.5 7 0 ; 7 5 7 0 ; 8 5 7 2.5
9 5 7 5 ; 10 2.5 7 5 ; 11 0 7 5
12 0 7 2.5 ; 13 2.5 7 2.5

The joint number followed by the X, Y and Z coordinates are specified above.

Note: Semicolons (;) are used as line separators to allow for input of multiple sets of data on one line.

MEMBER INCIDENCES
1 1 5 ; 2 2 7 ; 3 3 9 ; 4 4 11 ; 5 5 6 ; 6 6 7
7 7 8 ; 8 8 9 ; 9 9 10 ; 10 10 11 ; 11 11 12 ; 12 12 5
13 6 13 ; 14 13 10 ; 15 8 13 ; 16 13 12

The members are defined by the joints to which they are connected.

UNIT MMS
MEMBER PROPERTIES
Members 1 to 16 are defined as PRISmatic sections with width and depth values provided using the YD and ZD options. The UNIT command is specified to change the units for length from METER to MMS.

SUPPORTS
1 TO 4 PINNED

Joints 1 to 4 are declared to be pinned-supported.

DEFINE MATERIAL START
ISOTROPIC CONCRETE
E 21 0

STRENGTH FCU 0 0275
END DEFINE MATERIAL

The modulus of elasticity (E), density and Poisson's ratio are specified following the command CONSTANTS. Built-in default values for concrete are used.

DEFINE TIME HISTORY
TYPE 1 FORCE
* FOLLOWING LINES FOR HARMONIC LOADING GENERATOR
FUNCTION SINE
AMPLITUDE 30 FREQUENCY 60 CYCLES 100
*
ARRIVAL TIMES
0 0
DAMPING 0 075

There are two stages in the command specification required for a time-history analysis. The first stage is defined above. Here, the parameters of the sinusoidal loading are provided.

Each data set is individually identified by the number that follows the TYPE command. In this file, only one data set is defined, which is apparent from the fact that only one TYPE is defined.

The word FORCE that follows the TYPE 1 command signifies that this data set is for a forcing function. (If you want to specify an earthquake motion, an ACCELERATION may be specified.)

The command FUNCTION SINE indicates that instead of providing the data set as discrete TIME-FORCE pairs, a sinusoidal function, which describes the variation of force with time, is provided.

The parameters of the sine function, such as FREQUENCY, AMPLITUDE, and number of CYCLES of application are then defined. STAAD internally generates discrete TIME-FORCE pairs of data from the sine function in steps of time defined by the default value (refer to TR.31.4 Definition of Time History Load (on page 2416) for more information). The arrival time value indicates the relative value of time at which the force begins to act upon the structure. The modal damping ratio for all the modes is set to 0.075.

UNIT METER
LOAD 1
MEMBER LOAD
5 6 7 8 9 10 11 12 UNI GY -10 0
The above data describe a static load case. A uniformly distributed load of 10 kN/m acting in the negative global Y direction is applied on some members.

```
LOAD 2
SELFWEIGHT X 1.0
SELFWEIGHT Y 1.0
SELFWEIGHT Z 1.0
JOINT LOAD
  8 12 FX 15.0
  8 12 FY 15.0
  8 12 FZ 15.0
TIME LOAD
  8 12 FX 1 1
```

This is the second stage of command specification for time history analysis. The two sets of data specified here are:

a. the weights for generation of the mass matrix

b. the application of the time varying loads on the structure.

The weights (from which the masses for the mass matrix are obtained) are specified in the form of selfweight and joint loads.

Following that, the sinusoidal force is applied using the TIME LOAD command. The forcing function described by the TYPE 1 load is applied on joints 8 and 12 and it starts to act starting at a time defined by the 1st arrival time number.

```
PERFORM ANALYSIS
PRINT ANALYSIS RESULTS
FINI
```

The above commands are self explanatory. The FINISH command terminates the STAAD run.

EX. UK-23 Spring Support Generation for a Slab on Grade

This example illustrates the usage of commands necessary to automatically generate spring supports for a slab on grade. The slab is subjected to pressure loading and analysis of the structure is performed.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK\UK-23 Spring Support Generation for a Slab on Grade.STD when you install the program.

where:

\[ H = 43m, h_1 = 2.83m, h_2 = 2.67m, h_3 = 2m \]
\[ V = 13.33m, v_1 = 2.17m, v_2 = 2m, v_3 = 2.61m, v_4 = 1.33m \]

**STAAD SPACE SLAB ON GRADE**

Every STAAD input file has to begin with the word STAAD. The word SPACE signifies that the structure is a space frame and the geometry is defined through X, Y, and Z axes. The remainder of the words form a title to identify this project.
The units for the data that follows are specified above.

<table>
<thead>

</table>

REPEAT ALL 3 2.83 0.0 0.0
REPEAT 3 2.67 0.0 0.0
REPEAT 5 2 0.0 0.0
REPEAT 3 2.67 0.0 0.0
REPEAT 3 2.83 0.0 0.0

For joints 1 through 7, the joint number followed by the X, Y, and Z coordinates are specified above. The coordinates of these joints is used as a basis for generating 21 more joints by incrementing the X coordinate of each of these seven joints by 2.83 meters, three times. REPEAT commands are used to generate the remaining joints of the structure. The results of the generation may be visually verified using the STAAD graphical viewing facilities.

<table>
<thead>
<tr>
<th>ELEMENT</th>
<th>INCIDENCES</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 1 8 9 2 TO 6</td>
<td></td>
</tr>
<tr>
<td>REPEAT 16 6 7</td>
<td></td>
</tr>
</tbody>
</table>

The incidences of element number 1 is defined and that data is used as a basis for generating the 2nd through the 6th element. The incidence pattern of the first six elements is then used to generate the incidences of 96 (= 16 x 6) more elements using the REPEAT command.

UNIT CM
ELEMENT PROPERTIES
1 TO 102 TH 14.0

The thickness of elements 1 to 102 is specified as 14 cms following the command ELEMENT PROPERTIES.

CONSTANTS
MATERIAL CONCRETE ALL
UNIT METER

The DEFINE MATERIAL command is used to specify material properties and the CONSTANT is used to assign the material to all members.

SUPPORTS
1 TO 126 ELASTIC MAT DIRECTION Y SUB 1570.

The above command is used to instruct STAAD to generate supports with springs which are effective in the global Y direction. These springs are located at nodes 1 to 126. The subgrade modulus of the soil is specified as
1570 KN/cu.m. The program will determine the area under the influence of each joint and multiply the influence area by the subgrade reaction to arrive at the spring stiffness for the FY degree of freedom at the joint. See TR. 27.3 Automatic Spring Support Generator for Foundations (on page 2294).

PRINT SUPP INFO

This command will enable us to obtain the details of the support conditions which were generated using the earlier commands.

LOAD 1 WEIGHT OF MAT & EARTH
ELEMENT LOAD
1 TO 102 PR GY -74.2

The above data describe a static load case. A pressure load of 74.2 kN/sq.m. acting in the negative global Y direction is applied on all the 102 elements.

LOAD 2 'COLUMN LOAD-DL+LL'
JOINT LOADS
1 2 FY -965.
8 9 FY -485.

113 114 FY -485.
120 121 FY -965.
124 FY -1216.
125 FY -2431.

Load case 2 consists of several joint loads acting in the negative global Y direction.

LOADING COMBINATION 101 TOTAL LOAD
1 1. 2 1.

A load combination case, identified with load case number 101, is specified above. It instructs STAAD to factor loads 1 and 2 by a value of 1.0 and then algebraically add the results.

PERFORM ANALYSIS

The analysis is initiated using the above command.

UNIT CM
LOAD LIST 101
PRINT JOINT DISPLACEMENTS LIST 33 56
PRINT ELEMENT STRESSES LIST 34 67

Joint displacements for joints 33 and 56, and element stresses for elements 34 and 67, for load case 101, is obtained with the help of the above commands.

FINISH

The STAAD run is terminated.

### EX. UK-24 Analysis of a Concrete Block Using Solid Elements

This is an example of the analysis of a structure modeled using solid finite elements. This example also illustrates the method for applying an enforced displacement on the structure.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK \UK-24 Analysis of a Concrete Block Using Solid Elements.STD when you install the program.
STAAD SPACE

*EXAMPLE PROBLEM USING SOLID ELEMENTS

Every STAAD input file has to begin with the word STAAD. The word SPACE signifies that the structure is a space frame and the geometry is defined through X, Y, and Z axes. The comment line which begins with an asterisk is an optional title to identify this project.

UNIT KNS MET

The units for the data that follows are specified above.

<table>
<thead>
<tr>
<th>JOINT COORDINATES</th>

</tr>
<tr>
<td>49   2.0  0.0  0.0</td>
</tr>
</tbody>
</table>

The joint number followed by the X, Y, and Z coordinates are specified above. The coordinates of some of those nodes are generated utilizing the fact that they are equally spaced between the extremities.

<th>ELEMENT INCIDENCES SOLID</th>
</tr>
</thead>
<tbody>
<tr>
<td>1    1 5 6 2 21 25 26 22 TO 3</td>
</tr>
</tbody>
</table>
The incidences of solid elements are defined above. The word SOLID is used to signify that these are 8-node solid elements as opposed to 3-noded or 4-noded plate elements. Each line contains the data for generating 3 elements. For example, element number 1 is first defined by all of its 8 nodes. Then, increments of 1 to the joint number and 1 to the element number (the defaults) are used for generating incidences for elements 2 and 3. Similarly, incidences of elements 4, 7 and 10 are defined while those of 5, 6, 8, 9, 11 and 12 are generated.

```
UNIT MMS
DEFINE MATERIAL START
  ISOTROPIC STEEL
  E 210
  POISSON 0.25
  DENSITY 7.5e-008
  ALPHA 6e-006
  DAMP 0.03
  TYPE STEEL
  STRENGTH FY 0.25 FU 0.4 RY 1.5 RT 1.2
END DEFINE MATERIAL
```

The DEFINE MATERIAL command is used to specify material properties and the CONSTANT is used to assign the material to all members.

```
PRINT ELEMENT INFO SOLID LIST 1 TO 5
```

This command will enable us to obtain, in a tabular form, the details of the incidences and material property values of elements 1 to 5.

```
SUPPORTS
  1 5 21 25 29 41 45 49 PINNED
  9 ENFORCED
```

The above lines contain the data for supports for the model. The ENFORCED support condition is used to declare a point at which an enforced displacement load is applied later (see load case 3).

```
LOAD 1
  SELF Y -1.0
  JOINT LOAD
  28 FY -1000.0
```

The above data describe a static load case. It consists of selfweight loading and a joint load, both in the negative global Y direction.

```
LOAD 2
  JOINT LOADS
  2 TO 4 22 TO 24 42 TO 44 FX 100.0
```

Load case 2 consists of several joint loads acting in the positive global X direction.

```
LOAD 3
  SUPPORT DISPLACEMENT
  9 FX 0.0011
```
Load case 3 consists of an enforced displacement along the global X direction at node 9. The displacement in the other enforced support degrees of freedom will default to zero.

</tr>
</tbody>
</table>

In Load case 4, a pressure load of 500 pounds/sq.ft is applied on Face # 4 of solid elements 3, 6, 9 and 12. Face 4 is defined as shown in the following table:

<table>
<thead>
<tr>
<th>Face Number</th>
<th>Surface Joints</th>
</tr>
</thead>
<tbody>
<tr>
<td>f_1</td>
<td>f_2</td>
</tr>
<tr>

</thead>
<tbody>
<tr>
<td>LOAD</td>
<td>5</td>
</tr>
<tr>
<td>REPEAT LOAD</td>
<td>1 1.0 2 1.0 3 1.0 4 1.0</td>
</tr>
</tbody>
</table>

Load case 5 illustrates the technique employed to instruct STAAD to create a load case which consists of data to be assembled from other load cases already specified earlier. We want the program to analyze the structure for loads from cases 1 through 4 acting simultaneously. In other words, the above instruction is the same as the following:

LOAD 5
SELF Y -1.0
JOINT LOAD
28 FY -1000.0
2 TO 4 22 TO 24 42 TO 44 FX 100.0
SUPPORT DISPLACEMENT
9 FX .0011
ELEMENT LOAD SOLIDS
3 6 9 12 FACE 4 PRE GY -500.0
LOAD COMB 10
1 1.0 2 1.0

Load case 10 is a combination load case, which combines the effects of cases 1 & 2. While the syntax of this might look very similar to that of the REPEAT LOAD case shown in case 5, there is a fundamental difference. In a REPEAT LOAD case, the program computes the displacements by multiplying the inverted stiffness matrix by the
load vector built for the REPEAT LOAD case. But in solving load combination cases, the program merely calculates the end results (displacements, forces, reactions) by gathering up the corresponding values from the individual components of the combination case, factoring them, and then algebraically summing them up. This difference in approach is quite important in that non-linear problems such as PDELTA ANALYSIS, MEMBER TENSION, and MEMBER COMPRESSION situations, changes in support conditions etc. should be handled using REPEAT LOAD cases, not load combination cases.

A static equilibrium report, consisting of total applied loading and total support reactions from each primary load case is requested along with the instructions to carry out a linear static analysis.

Global displacements at nodes 8 and 9 are obtained using the above command.

Reactions at the supports are obtained using the above command.

This command requests the program to provide the element stress results at the nodes of elements 4 and 6. The results will be printed for all the load cases. The word SOLID is used to signify that these are solid elements as opposed to plate or shell elements.

The STAAD run is terminated.

EX. UK-25 Analysis of a Structure with Compression-Only Members

This example demonstrates the usage of compression-only members. Since the structural condition is load dependent, the PERFORM ANALYSIS command is specified once for each primary load case.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK \UK-25 Analysis of a Structure with Compression-Only Members.STD when you install the program.
This example has been created to illustrate the command specification for a structure with certain members capable of carrying compressive force only. It is important to note that the analysis can be done for only 1 load case at a time. This is because, the set of “active” members (and hence the stiffness matrix) is load case dependent.

where:

\[
L = 5.25 \text{ m}, \quad H = 3.5 \text{ m}
\]

Load case 1: \(P_1 = 45 \text{ kN} \) & \(P_2 = 70 \text{ kN}\)

Load case 2: \(P_3 = -45 \text{ kN} \) & \(P_4 = -70 \text{ kN}\)

**STAAD PLANE**

* EXAMPLE FOR COMPRESSION-ONLY MEMBERS

The input data is initiated with the word STAAD. This structure is a PLANE frame. The second line is an optional comment line.

**UNIT METER KNS**

Units for the commands to follow are specified above.

**JOINT COORDINATES**

\[
1 \ 0 \ 0 ; \ 2 \ 0 \ 3.5 ; \ 3 \ 0 \ 7.0 ; \ 4 \ 5.25 \ 7.0 ; \ 5 \ 5.25 \ 3.5 ; \ 6 \ 5.25 \ 0
\]
Joint coordinates of joints 1 to 6 are defined above.

```
MEMBER INCIDENCES
  1 1 2 5 ; 6 1 5 ; 7 2 6 ; 8 2 4 ; 9 3 5 ; 10 2 5
```

The members 1 to 10 are defined along with the joints to which they are connected.

```
MEMBER COMPRESSION
  6 TO 9
```

Members 6 to 9 are defined as COMPRESSION-only members. Hence for each load case, if during the analysis, any of the members 6 to 9 is found to be carrying a tensile force, it is disabled from the structure and the analysis is carried out again with the modified structure.

```
MEMBER PROPERTY BRITISH
  1 TO 10 TA ST UC152X152X30
```

Members 1 to 10 are assigned the UC152X152X30 section from the British steel table.

```
UNIT MMS
DEFINE MATERIAL START
  ISOTROPIC STEEL
  E 210
  POISSON 0.3
  DENSITY 7.8977e-008
  ALPHA 6e-006
  DAMP 0.03
  TYPE STEEL
  STRENGTH FY 0.25 FU 0.4 RY 1.5 RT 1.2
END DEFINE MATERIAL
CONSTANTS
  MATERIAL STEEL ALL
UNIT METER
```

The `DEFINE MATERIAL` command is used to specify material properties and the `CONSTANT` is used to assign the material to all members.

```
SUPPORT
  1 6 PINNED
```

Joints 1 and 6 are declared as pinned-supported.

```
LOAD 1
  JOINT LOAD
  2 FX 70
  3 FX 45
```

Load 1 is defined above and consists of joint loads in the global X direction at joints 2 and 3.

```
PERFORM ANALYSIS
```

The above structure is analyzed for load case 1.

```
CHANGE
MEMBER COMPRESSION
  6 TO 9
```

One or more among the members 6 to 9 may have been in-activated in the previous analysis. The `CHANGE` command restores the original structure to prepare it for the analysis for the next primary load case. The members with the compression-only attribute are specified again.

```
LOAD 2
  JOINT LOAD
```
In load case 2, joint loads are applied in the negative global X direction at joints 4 and 5.

PERFORM ANALYSIS
CHANGE

The instruction to analyze the structure is specified again. Next, any compression-only members that were inactivated during the second analysis (due to the fact that they were subjected to tensile axial forces) are re-activated with the CHANGE command. Without the re-activation, these members cannot be accessed for further processing.

LOAD 3
REPEAT LOAD
1 1.0 2 1.0

Load case 3 illustrates the technique employed to instruct STAAD to create a load case which consists of data to be assembled from other load cases already specified earlier. We would like the program to analyze the structure for loads from cases 1 and 2 acting simultaneously. In other words, the above instruction is the same as the following:

LOAD 3
JOINT LOAD
2 FX 70
3 FX 45
4 FX -45
5 FX -70
PERFORM ANALYSIS

The analysis is carried out for load case 3.

CHANGE

The members inactivated during the analysis of load case 3 are re-activated for further processing.

LOAD LIST ALL

At the end of any analysis, only those load cases for which the analysis was done most recently, are recognized as the “active” load cases. The LOAD LIST ALL command enables all the load cases in the structure to be made active for further processing.

PRINT ANALYSIS RESULTS

The program is instructed to write the joint displacements, support reactions and member forces to the output file.

FINISH

The STAAD run is terminated.

EX. UK-26 Modeling a Rigid Diaphragm Using Control-Dependent

The structure in this example is a building consisting of member columns as well as floors made up of beam members and plate elements. Using the control-dependent command, the floors are specified to be rigid diaphragms for in-plane actions but flexible for bending actions.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK \UK-26 Modeling a Rigid Diaphragm Using Control-Dependent.STD when you install the program.
STAAD SPACE

*MODELING RIGID DIAPHRAGMS USING CONTROL DEPENDENT

Every STAAD input file has to begin with the word STAAD. The word SPACE signifies that the structure is a space frame and the geometry is defined through X, Y and Z axes. The second line is an optional title to identify this project.

UNITS KIP FT

Specify units for the following data.

JOINT COORD
1 0 0 4 0 48 0
REPEAT 3 24 0 0
REPEAT ALL 3 0 0 24
DELETE JOINT 21 25 37 41

The joint numbers and coordinates are specified above. The unwanted joints, created during the generation process used above, are then deleted.

MEMBER INCI
1 1 2 3 ; 4 5 6 6 ; 7 9 10 9 ; 10 13 14 12
13 17 18 15 ; 22 29 30 24 ; 25 33 34 27
34 45 46 36 ; 37 49 50 39 ; 40 53 54 42
43 57 58 45 ; 46 61 62 48 ; 49 2 6 51
52 6 10 54 ; 55 10 14 57 ; 58 18 22 60
61 22 26 63 ; 64 26 30 66 ; 67 34 38 69
The MEMBER INCIDENCE specification is used for specifying MEMBER connectivities.

<table>

</tr>
</tbody>
</table>

**Tip:** The elements are *not* what provides the diaphragm action for this model. Rather, the control-dependent node relationships defined later in the model dictate that interaction.

All members are WIDE FLANGE sections whose properties are obtained from the built in American steel table.

</table>
The **DEFINE MATERIAL** command is used to specify material properties and the **CONSTANT** is used to assign the material to all members. The orientation of some of the members is set using the BETA angle command.

The supports at the above mentioned joints are declared as fixed.

The three floors of the structure are specified to act as rigid diaphragms in the ZX plane with the corresponding control joint specified. The associated dependent joints in a floor are specified by the **YRANGE** parameter. The floors may still resist out-of-plane bending actions flexibly.

The above data describe a static load case. It consists of joint loads that create a torsional loading on the structure.

The above data describe a static load case. It consists of plate element pressure on a floor in the negative global Y direction.

The above command instructs the program to proceed with the analysis.

Print displacements at selected joints, then print member forces for two members, then print support reactions at selected joints.

The STAAD run is terminated.

### 99. Finish
EX. UK-27 Modeling Soil Springs for a Slab on Grade

This example illustrates the usage of commands necessary to apply the compression only attribute to spring supports for a slab on grade. The spring supports themselves are generated utilizing the built-in support generation facility. The slab is subjected to pressure and overturning loading. A tension/compression only analysis of the structure is performed.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK \UK-27 Modeling Soil Springs for a Slab on Grade.STD when you install the program.

The numbers shown in the diagram below are the element numbers.

![Diagram of Example Problem No. 27]

where:

\[ H = 129', h1 = 8'-6", h2 = 8', h3 = 6' \]
STAAD SPACE SLAB ON GRADE
* SPRING COMPRESSION EXAMPLE

Every STAAD input file has to begin with the word STAAD. The word SPACE signifies that the structure is a space frame and the geometry is defined through X, Y, and Z axes. An optional title to identify this project is provided in the second line.

SET NL 3

This structure has to be analyzed for 3 primary load cases. Consequently, the modeling of our problem requires us to define 3 sets of data, with each set containing a load case and an associated analysis command. Also, the supports which get switched off in the analysis for any load case have to be restored for the analysis for the subsequent load case. To accommodate these requirements, it is necessary to have 2 commands: SET NL and CHANGE. The SET NL command is used above to indicate the total number of primary load cases that the file contains. The CHANGE command will come in later (after the PERFORM ANALYSIS command).

UNIT FEET KIP

JOINT COORDINATES
1 0.0 0.0 40.0
2 0.0 0.0 36.0
3 0.0 0.0 28.167
4 0.0 0.0 20.333
5 0.0 0.0 12.5
6 0.0 0.0 6.5
7 0.0 0.0 0.0
REPEAT ALL 3 8.5 0.0 0.0
REPEAT 3 8.0 0.0 0.0
REPEAT 5 6.0 0.0 0.0
REPEAT 3 8.0 0.0 0.0
REPEAT 3 8.5 0.0 0.0

For joints 1 through 7, the joint number followed by the X, Y and Z coordinates are specified above. The coordinates of these joints is used as a basis for generating 21 more joints by incrementing the X coordinate of each of these 7 joints by 8.5 feet, 3 times. REPEAT commands are used to generate the remaining joints of the structure. The results of the generation may be visually verified using the STAAD graphical viewing facilities.

ELEMENT INCIDENCES
1 1 8 9 2 TO 6
REPEAT 16 6 7

The incidences of element number 1 is defined and this data is used as a basis for generating the 2nd through the 6th element. The incidence pattern of the first 6 elements is then used to generate the incidences of 96 more elements using the REPEAT command.

UNIT INCH

ELEMENT PROPERTIES
1 TO 102 TH 8.0

The thickness of elements 1 to 102 is specified as 8.0 inches following the command ELEMENT PROPERTIES.

DEFINE MATERIAL START
ISOTROPIC CONCRETE
E 4000.0
POISSON 0.12
DENSITY 8.68e-005
ALPHA 5e-006
DAMP 0.05
G 1346.15
The modulus of elasticity (E) and Poisson's Ratio are specified following the command CONSTANTS.

The above two lines declare the spring supports at nodes 1 to 126 as having the compression-only attribute. The supports themselves are being generated later (see the ELASTIC MAT command which appears later).

The above command is used to instruct STAAD to generate supports with compression-only springs which are effective in the global Y direction. These springs are located at nodes 1 to 126. The subgrade reaction of the soil is specified as 12 kip/cu.ft. The program will determine the area under the influence of each joint and multiply the influence area by the subgrade reaction to arrive at the spring stiffness for the "FY" degree of freedom at the joint. Units for length are changed to FEET to facilitate the input of subgrade reaction of soil. See TR.27.3 Automatic Spring Support Generator for Foundations (on page 2294).

The above data describe a static load case. A pressure load of 1.50 kip/ft acting in the negative global Y direction is applied on all the elements.

Tension/compression cases must each be followed by PERFORM ANALYSIS and CHANGE commands. The CHANGE command restores the original structure to prepare it for the analysis for the next primary load case.
Load case 2 consists of several joint loads acting in the negative global Y direction. This is followed by another ANALYSIS command. The CHANGE command restores the original structure once again for the forthcoming load case.

**** MAXIMUM STRESSES AMONG SELECTED PLATES AND CASES ****
EX. UK-28 Calculation of Modes and Frequencies of a Bridge

This example demonstrates the input required for obtaining the modes and frequencies of the skewed bridge shown in the figure below. The structure consists of piers, pier-cap girders and a deck slab.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK\UK-28 Calculation of Modes and Frequencies of a Bridge.std when you install the program.
STAAD SPACE FREQUENCIES OF VIBRATION OF A SKewed BRIDGE

Every STAAD input file has to begin with the word STAAD. The word SPACE signifies that the structure is a space frame and the geometry is defined through X, Y and Z axes. The remainder of the words forms a title to identify this project.

IGNORE LIST

Further below in this file, we will call element lists in which some element numbers may not actually be present in the structure. We do so because it minimizes the effort involved in fetching the desired elements and reduces the size of the respective commands. To prevent the program from treating that condition (referring to elements which do not exist) as an error, the above command is required.

UNIT METER KN

The units for the data that follows are specified above.

<table>
<thead>
<tr>
<th>JOINT COORDINATES</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 0 0 0; 2 4 0 0; 3 6.5 0 0; 4 9 0 0; 5 11.5 0 0; 6 15.5 0 0; 11 -1 10 0 25 16.5 10 0</td>
</tr>
</tbody>
</table>

For joints 1 through 6, the joint number followed by the X, Y and Z coordinates are specified first.

Next, using the coordinates of joints 11 and 25 as the basis, joints 12 through 24 are generated using linear interpolation.

Following this, using the data of these 21 joints (1 through 6 and 11 through 25), 63 new joints are generated. To achieve this, the X coordinate of these 21 joints is incremented by 4 meters and the Z coordinate is incremented by 14 meters, in 3 successive operations.
The **REPEAT ALL** command is used for the generation. Details of this command is available in TR.11 Joint Coordinates Specification (on page 2193). The results of the generation may be visually verified using STAAD.Pro’s graphical viewing facilities.

\[\text{MEMBER INCI}\]

1 1 13 ; 2 2 15 ; 3 3 17 ; 4 4 19 ; 5 5 21 ; 6 6 23
26 26 34 ; 27 27 36 ; 28 28 38 ; 29 29 40 ; 30 30 42 ; 31 31 44
47 47 55 ; 48 48 57 ; 49 49 59 ; 50 50 61 ; 51 51 63 ; 52 52 65
68 68 76 ; 69 69 78 ; 70 70 80 ; 71 71 82 ; 72 72 84 ; 73 73 86

The member connectivity data (joint numbers between which members are connected) is specified for the 24 columns for the structure. The above method, where the member number is followed by the 2 node numbers, is the explicit definition method. No generation is involved here.

\[\text{DEFINE MESH}\]

A JOINT 11
B JOINT 25
C JOINT 46
D JOINT 32
E JOINT 67
F JOINT 53
G JOINT 88
H JOINT 74

The next step is to generate the deck slab which will be modeled using plate elements. For this, we use a technique called mesh generation. Mesh generation is a process of generating several "child" elements from a "parent" or "super" element. The above set of commands defines the corner nodes of the super-element. Details of the above can be found in TR.14.2 Element Mesh Generation (on page 2204).

Note that instead of elaborately defining the coordinates of the corner nodes of the super-elements, we have taken advantage of the fact that the coordinates of these joints (A through H) have already been defined or generated earlier. Thus, A is the same as joint 11 while D is the same as joint 32. Alternatively, we could have defined the super-element nodes as A -1 10 0 ; B 16.5 10 0 ; C 20.5 10 14 ; D 3 10 14 ; etc.

\[\text{GENERATE ELEMENT}\]

MESH ABCD 14 12
MESH DCEF 14 12
MESH FEGH 14 12

The above lines are the instructions for generating the "child" elements from the super-elements. For example, from the super-element bound by the corners A, B, C and D (which in turn are nodes 11, 25, 46 and 32), we generate a total of 14X12=168 elements, with 14 divisions along the edges AB and CD, and 12 along the edges BC and DA. These are the elements which make up the first span.

Similarly, 168 elements are created for the 2nd span, and another 168 for the 3rd span.

It may be noted here that we have taken great care to ensure that the resulting elements and the piercap beams form a perfect fit. In other words, there is no overlap between the two in a manner that nodes of the beams are at a different point in space than nodes of elements. At every node along their common boundary, plates and
beams are properly connected. This is absolutely essential to ensure proper transfer of load and stiffness from beams to plates and vice versa. The tools in the user interface may be used to confirm that beam-plate connectivity is proper for this model.

   _P6 881 TO 884 888 TO 891 895 TO 898 902 TO 905
END GROUP DEFINITION
```

The above block of data is referred to as formation of groups. Group names are a mechanism by which a single moniker can be used to refer to a cluster of entities, such as members. For our structure, the piercap beams are being grouped to a name called GIRDERS, the pier columns are assigned the name PIERS, and so on. For the deck, a few selected elements are chosen into a few selective groups. The reason is that these elements happen to be right beneath wheels of vehicles whose weight will be used in the frequency calculation.

```plaintext
MEMBER PROPERTY
   _GIRDERS PRIS YD 0.6 ZD 0.6
   _PIERS PRIS YD 1.0
```

Member properties are assigned as prismatic rectangular sections for the girders, and prismatic circular sections for the columns.

```plaintext
ELEMENT PROPERTY
YRA 9 11 TH 0.375
```

The plate elements of the deck slab, which happen to be at a Y elevation of 10 metres (between a YRANGE of 9 metres and 11 metres) are assigned a thickness of 375 mms.

```plaintext
UNIT KNS MMS

  G 9.25
  TYPE CONCRETE
  STRENGTH FCU 0.0275
END DEFINE MATERIAL
CONSTANTS
MATERIAL CONCRETE ALL
```

The Modulus of elasticity (E) is set to 21000 N/sq.mm for all members. The keyword CONSTANTS has to precede this data. Built-in default value for Poisson's ratio for concrete is also assigned to ALL members and elements.

```plaintext
UNIT KNS METER
CONSTANTS
DENSITY 24 ALL
```
Following a change of units, density of concrete is specified.

The base nodes of the piers are fully restrained (FIXED supports).

Theoretically, a structure has as many modes of vibration as the number of degrees of freedom in the model. However, the limitations of the mathematical process used in extracting modes may limit the number of modes that can actually be extracted. In a large structure, the extraction process can also be very time consuming. Further, not all modes are of equal importance. (One measure of the importance of modes is the participation factor of that mode.) In many cases, the first few modes may be sufficient to obtain a significant portion of the total dynamic response.

Due to these reasons, in the absence of any explicit instruction, STAAD calculates only the first 6 modes. This is like saying that the command \texttt{CUT OFF MODE SHAPE 6} has been specified.

If the inspection of the first 6 modes reveals that the overall vibration pattern of the structure has not been obtained, one may ask STAAD to compute a larger (or smaller) number of modes with the help of this command. The number that follows this command is the number of modes being requested. In our example, we are asking for 65 modes by specifying \texttt{CUT OFF MODE SHAPE 65}.

The mathematical method that STAAD uses is called the eigen extraction method. Some information on this is available in G.17.3 Dynamic Analysis (on page 2130). The method involves 2 matrices - the stiffness matrix, and the mass matrix.

The stiffness matrix, usually called the \([K]\) matrix, is assembled using data such as member and element lengths, member and element properties, modulus of elasticity, Poisson's ratio, member and element releases, member offsets, support information, etc.

For assembling the mass matrix, called the \([M]\) matrix, STAAD uses the load data specified in the load case in which the MODAL CAL REQ command is specified. So, some of the important aspects to bear in mind are:
1. The input you specify is weights, not masses. Internally, STAAD will convert weights to masses by dividing the input by "g", the acceleration due to gravity.

2. If the structure is declared as a PLANE frame, there are 2 possible directions of vibration - global X, and global Y. If the structure is declared as a SPACE frame, there are 3 possible directions - global X, global Y and global Z. However, this does not guarantee that STAAD will automatically consider the masses for vibration in all the available directions.

You have control over and are responsible for specifying the directions in which the masses ought to vibrate. In other words, if a weight is not specified along a certain direction, the corresponding degrees of freedom (such as for example, global X at node 34 hypothetically) will not receive a contribution in the mass matrix. The mass matrix is assembled using only the masses from the weights and directions you specify.

In our example, notice that we are specifying the selfweight along global X, Y and Z directions. Similarly, a 200 kg/sq.m pressure load is also specified along all 3 directions on the deck.

But for the truck loads, we choose to apply it on just a few elements in the global Y and Z directions only. The reasoning is something like - for the X direction, the mass is not capable of vibrating because the tires allow the truck to roll along X. Remember, this is just a demonstration example, not necessarily what you may want to do.

The point we want to illustrate is that if you want to restrict a certain weight to certain directions only, all you need to do is not provide the directions in which those weights cannot vibrate in.

3. As much as possible, provide absolute values for the weights. STAAD is programmed to algebraically add the weights at nodes. So, if some weights are specified as positive numbers and others as negative, the total weight at a given node is the algebraic summation of all the weights in the global directions at that node and the mass is then derived from this algebraic resultant.

MODAL CALCULATION REQUESTED

This is the command which tells the program that frequencies and modes should be calculated. It is specified inside a load case. In other words, this command accompanies the loads that are to be used in generating the mass matrix.

Frequencies and modes have to be calculated also when dynamic analysis such as response spectrum or time history analysis is carried out. But in such analyses, the MODAL CALCULATION REQUESTED command is not explicitly required. When STAAD encounters the commands for response spectrum (see example 11) and time history (see examples 16 and 22), it automatically will carry out a frequency extraction without the help of the MODAL.. command.

PERFORM ANALYSIS

This initiates the processes which are required to obtain the frequencies. Frequencies, periods and participation factors are automatically reported in the output file when the operation is completed.

FINISH

This terminates the STAAD run.

</tbody>
</table>
In the explanation earlier for the CUT OFF MODE command, we said that one measure of the importance of a mode is the participation factor of that mode. We can see from the above report that for vibration along Z direction, the first mode has a 99.04 percent participation. It is also apparent that the 7th mode is primarily a Y direction mode with a 26.42% participation along Y and 0 in X and Z.

The ΣX, ΣY and ΣZ columns show the cumulative value of the participation of all the modes up to and including a given mode (Corresponding to the SUMM-X, SUMM-Y, and SUMM-Z reported in the output, respectively). One can infer from those terms that if one is interested in 95% participation along X, the first 2 modes are sufficient.

But for the Y direction, even with 10 modes, we barely obtained 60%. The reason for this can be understood by an examination of the nature of the structure. The deck slab is capable of vibrating in several low energy and primarily vertical direction modes. The out-of-plane flexible nature of the slab enables it to vibrate in a manner resembling a series of wave like curves. Masses on either side of the equilibrium point have opposing eigenvector values leading to a lot of cancellation of the contribution from the respective masses. Localized modes, where small pockets in the structure undergo flutter due to their relative weak stiffness compared to the rest of the model, also result in small participation factors.

iii. After the analysis is completed, select Post-processing from the mode menu. This screen contains facilities for graphically examining the shape of the mode in static and animated views. The Dynamics page on the left side of the screen is available for viewing the shape of the mode statically. The Animation option of the Results menu can be used for animating the mode. The mode number can be selected from the Loads and Results tab of the Diagrams dialog box which opens when the Animation option is chosen. The size to which the mode is drawn is controlled using the Scales tab of the Diagrams dialog box.

EX. UK-29 Time History Analysis of a Frame for Seismic Loads

Analysis and design of a structure for seismic loads is demonstrated in this example. In this model, static load cases are solved along with the seismic load case. For the seismic case, the maximum values of displacements, forces and reactions are obtained. The results of the dynamic case are combined with those of the static cases and steel design is performed on the combined cases.

This problem is installed with the program by default to C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\UK\UK-29 Time History Analysis of a Frame for Seismic Loads.std when you install the program.
Actual input is shown in bold lettering followed by explanation.

**STAAD SPACE DYNAMIC ANALYSIS FOR SEISMIC LOADS**

Every STAAD input file has to begin with the word STAAD. The word SPACE signifies that the structure is a space frame and the geometry is defined through X, Y and Z axes. The remainder of the words form a title to identify this project.

**UNIT METER KNS**

The units for the data that follows are specified above.

**JOINT COORDINATES**

1 0 0 0 ; 2 0 3.5 0 ; 3 0 5.3 0 ; 4 0 7 0
REPEAT ALL 1 9.5 0 0
REPEAT ALL 1 0 0 3
17 1.8 7 0 ; 18 4.6 7 0 ; 19 7.6 7 0
REPEAT ALL 1 0 0 3

For joints 1 through 4, the joint number is followed by the X, Y and Z coordinates as specified above. The coordinates of these joints are used as a basis for generating 12 more joints by incrementing the X & Z coordinates by specific amounts. REPEAT ALL commands are used for the generation. Details of these commands are available in [TR.11 Joint Coordinates Specification](#) (on page 2193). Following this, another round of explicit definition (joints 17, 18 & 19) and generation (20, 21 & 22) is carried out. The results of the generation may be visually verified using graphical view features in STAAD.Pro.

**MEMBER INCIDENCES**

1 1 2 3
REPEAT 1 3 4
7 9 10 9

*Figure 564: Example Problem No. 29*
A mixture of explicit definition and generation of member connectivity data (joint numbers between which members are connected) is used to generate 29 members for the structure.

```
START GROUP DEFINITION
MEMBER
  _VERTICAL 1 TO 12
  _XBEAM 13 TO 20
  _ZBEAM 21 TO 24 29
  _BRACE 25 TO 28
END GROUP DEFINITION
```

The above block of data is referred to as formation of groups. Group names are a mechanism by which a single moniker can be used to refer to a cluster of entities, such as members. For our structure, the columns are being grouped to a name called VERTICAL, the beams running along the X direction are assigned the name XBEAM, and so on.

```
MEMBER PROPERTIES CANADIAN
  _VERTICAL TA ST W310X97
  _XBEAM TA ST W250X39
  _ZBEAM TA ST C200X17
  _BRACE TA ST L152X152X13
```

Member properties are assigned from the Canadian steel table. The members which receive these properties are those embedded within the respective group names. The benefit of using the group name is apparent here. Just from the looks of the command, we can understand that the diagonal braces are being assigned a single angle. The alternative, which would be

```
25 TO 28 TA ST L152X152X13
```

would have required us to go to the graphical tools to get a sense of what members 25 to 28 are.

```
UNIT KNS MMS
DEFINE MATERIAL START
  ISOTROPIC STEEL
  E 200
  POISSON 0.3
  DENSITY 7.8e-008
  ALPHA 6e-006
  DAMP 0.03
  TYPE STEEL
  STRENGTH FY 0.24821 FU 0.399894 RY 1.5 RT 1.2
END DEFINE MATERIAL
CONSTANTS
  MATERIAL STEEL ALL
  BETA 180 MEMB 21 22
```

The DEFINE MATERIAL command is used to specify material properties and the CONSTANT is used to assign the material to all members. The BETA angle for the channels along the left edge is set to 180 so their legs point toward the interior of the structure.
The bottom ends of the columns of the platform are pinned supported.

```
CUT OFF MODE SHAPE 30
```

The above command is a critical command if you want to override the default number of modes computed and used in a dynamic analysis. The default, which is 6, may not always be sufficient to capture a significant portion of the structural response in a response spectrum or time history analysis, and hence the need to override the default. This command is explained in TR.30.1 Cut-Off Frequency, Mode Shapes, or Time (on page 2319).

```
UNIT METER
DEFINE TIME HISTORY
TYPE 1 ACCELERATION
READ EQDATA.TXT
ARRIVAL TIME
0.0
DAMPING 0.05
```

There are two stages in the command specification required for a time-history analysis. The first stage is defined above. Here, the parameters of the earthquake (ground acceleration) are provided.

Each data set is individually identified by the number that follows the TYPE command. In this file, only one data set is defined, which is apparent from the fact that only one TYPE is defined.

The word FORCE that follows the TYPE 1 command signifies that this data set is for a ground acceleration. (If you want to specify a forcing function, the keyword FORCE must be used instead.)

Notice the expression `READ EQDATA.TXT`. It means that we have chosen to specify the time vs. ground acceleration data in the file called `EQDATA.TXT`. That file must reside in the same folder as the one in which the data file for this structure resides. As explained in the small examples shown in TR.31.4 Definition of Time History Load (on page 2416), the `EQDATA.TXT` file is a simple text file containing several pairs of time-acceleration data. A sample portion of that file is as shown below.

```
  0.0000   0.006300
  0.0200   0.003640
  0.0400   0.000990
  0.0600   0.004280
  0.0800   0.007580
  0.1000   0.010870
```

While it may not be apparent from the above numbers, it may also be noted that the geological data for the site the building sits on indicate that the above acceleration values are a fraction of "g," the acceleration due to gravity. Thus, for example, at 0.02 seconds, the acceleration is 0.00364 multiplied by 9.806 m/sec^2 (or 0.00364 multiplied by 32.2 ft/sec^2). Consequently, the burden of informing the program that the values need to be multiplied by "g" is upon us, and we shall do so at a later step.

The arrival time value indicates the relative value of time at which the earthquake begins to act upon the structure. We have chosen 0.0, as there is no other dynamic load on the structure from the relative time standpoint. The modal damping ratio for all the modes is set to 0.05.

```
LOAD 1 WEIGHT OF STRUCTURE ACTING STATICALLY
SELFWEIGHT Y -1.0
```

The above data describe a static load case. The selfweight of the structure is acting in the negative global Y direction.

```
LOAD 2 PLATFORM LEVEL LOAD ACTING STATICALLY FLOOR LOAD
YRA 6.9 7.1 FLOAD -500
```
Load case 2 is also a static load case. At the Y=7.0m elevation, our structure has a floor slab. But, it is a non-structural entity which, though capable of carrying the loads acting on itself, is not meant to be an integral part of the framing system. It merely transmits the load to the beam-column grid.

There are uniform area loads on the floor (think of the load as wooden pallets supporting boxes of paper). Since the slab is not part of the structural model, how do we tell the program to transmit the imposed load from the slab to the beams without manually converting them to distributed beam loads ourselves? That is where the floor load utility comes in handy. It is a facility where we specify the load as a pressure, and the program converts the pressure to individual beam loads. Thus, the input required is very simple - load intensity in the form of pressure, and the region of the structure in terms of X, Y and Z coordinates in space, of the area over which the pressure acts.

In the process of converting the pressure to beam loads, STAAD will consider the empty space between crisscrossing beams (in plan view) to be panels, similar to the squares of a chess board. The load on each panel is then transferred to beams surrounding the panel, using a triangular or trapezoidal load distribution method.

<table>
<thead>
<tr>
<th>LOAD 3 DYNAMIC LOAD</th>

</tr>
<tr>
<td>YRANGE 6.9 7.1 FLOAD 500 GY</td>
</tr>
<tr>
<td>YRANGE 6.9 7.1 FLOAD 500 GZ</td>
</tr>
</tbody>
</table>

Load case 3 is the dynamic load case, the one which contains the second part of the instruction set for a dynamic analysis to be performed. The data here are

a. loads which will yield the mass values which will populate the mass matrix
b. the directions of the loads, which will yield the degree of freedom numbers of the mass matrix for being populated.

Thus, the selfweight, as well as the imposed loads on the non-structural slab are to be considered as participating in the vibration along all the global directions.

| GROUND MOTION X 1 1 9.806 |

The above command too is part of load case 3. Here we say that the seismic force, whose characteristics are defined by the TYPE 1 time history input data, acting at arrival time 1, is to be applied along the X direction. We mentioned earlier that the acceleration input data was specified as a fraction of “g”. The number 9.806 indicates the value which the acceleration data, as read from EQDATA.TXT are to be factored by before they are used.

<table>
<thead>
<tr>
<th>LOAD COMBINATION 11 (STATIC + POSITIVE OF DYNAMIC)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 1.0 2 1.0 3 1.0</td>
</tr>
<tr>
<td>LOAD COMBINATION 12 (STATIC + NEGATIVE OF DYNAMIC)</td>
</tr>
<tr>
<td>1 1.0 2 1.0 3 -1.0</td>
</tr>
</tbody>
</table>

In a time history analysis, the member forces FX thru MZ each have a value for every time step. If there are a 1000 time steps, there will be 1000 values of FX, 1000 for FY etc. for that load case. Not all of them can be used in a further calculation like a steel or concrete design. However, the maximum from among those time steps is available. If we want to do a design, one way to make sure that the structure is not under-designed is to create 2 load combination cases involving the dynamic case, a positive combination, and a negative combination.

That is what is being done above. Load combination case no. 11 consists of the sum of the static load cases (1 & 2) with the positive direction of the dynamic load case (3). Load combination case no. 12 consists of the sum of
the static load cases (1 & 2) with the negative direction of the dynamic load case (3). The user has discretion on what load factors to use with these combinations. We have chosen the factors to be 1.0.

**PERFORM ANALYSIS**

The above is the instruction to perform the analysis related calculations. That means, computing nodal displacements, support reactions, etc.

**PRINT ANALYSIS RESULTS**

The above command is an instruction to the program to produce a report of the joint displacements, support reactions and member end forces in the output file. As mentioned earlier, for the dynamic case, these will be just the maximum values, not the ones generated for every time step. If you want to see the results for each time step, you may do so by using STAAD’s Post-processing facilities.

```

***Note: Omega1 and Omega2 are calculated using C/S moment of analytical members.***

---

**EX. Modeling Examples**

These examples demonstrate using some of modeling features in STAAD.Pro.

**EX. Meshed Wall-Slab Connection**

This example demonstrates how to ensure finite element mesh compatibility between two adjoining meshed entities.
The Model Data

Use the **Copy to clipboard** button below to copy and paste this model data into an empty STAAD input file if you want to work through this example yourself.

**STAAD SPACE**
**UNIT FEET KIP**
**JOINT COORDINATES**
1 0 0 0; 2 18 0 0; 3 30 0 9; 4 30 0 30; 5 6 0 30; 6 0 0 21; 7 6 0 9; 8 18 0 24; 9 6 20 9; 10 18 20 24;  
**MEMBER INCIDENCES**
1 1 2; 2 2 3; 3 3 4; 4 4 5; 5 5 6; 6 6 1; 7 7 8; 8 9 10; 9 7 9; 10 8 10;  
**FINISH**

**Related Links**
- [M. To define a slab/wall connection](on page 670)

**EX. To create a new view**

To create a new view that isolates the slab members for meshing, use the following procedure.

1. On the **View** ribbon tab, select the **Front View** tool in the **Tools** group.

   ![View](image)
   
   The view rotates to this angle.

2. Click-and-drag the mouse pointer from the top-left towards the bottom-right of the slab members.

   **Note:** You may need to select the **Beam Cursor** tool on the **Select** ribbon tab first.
3. On the View ribbon tab, select the New View tool in the Views group.

The New View dialog opens.

4. Select the Display the view in the active window option and then click OK.

The new view is displayed in the active view window. Only the selected slab members are currently displayed. The wall members are still contained in the model. They are just hidden from this view.

5. On the View ribbon tab, select the Isometric View tool in the Tools group.

EX. To create a parametric model

To create a slab finite element mesh, use the following procedure.

1. Select the Parametric Models tool in the Plate group on the Geometry ribbon tab.

The Parametric Models dialog opens. The structure is displayed as a series of dashed lines to signify this mode can be used to experiment with various settings.

2. Click Add in the Parametric Models dialog.

The mouse pointer changes to the add surface cursor.

3. Specify the parametric model parameters:
   a. (Optional) Type a Name for the slab mesh.
   b. Select Slab from the Type drop-down list.
c. Set the **Use nodes and beams that occur on or inside the outer boundary as additional density lines and points?** option.

4. Click the corner nodes of the slab in a clockwise order, clicking on the first node selected to complete the boundary definition.

The **Mesh Parameters** dialog opens.

5. Specify the meshing parameters:
   Leave the Element Type as Triangular, the Boundary method as (C) Optimized, and the Default Number of Divisions of Boundary Edges as zero.
a. Select Basic from the Meshing Method drop-down list.
b. Type a Target element size of 100 (in).
c. Click OK.
A message dialog prompts if you want to add any openings.
6. Click No.
The preliminary mesh is displayed in the view window. The mesh parameters are displayed in the Parametric Models dialog.
7. In the Parametric Models dialog, select the Meshed Surface 1 [Slab] entry and then click Merge Mesh.
EX. To designate the wall-slab connection

To mesh the wall such that it is compatible with the slab mesh, use the following procedure.

1. In the Analytical Modeling workflow bar, select **Geometry**.
   The Parametric Modeling dialog closes and the plate model is displayed.
2. On the **View** ribbon tab, select the **Display Whole Structure** tool in the **Tools** group.

   ![Image of Parametric Modeling dialog]

   The standard view is restored, displaying the hidden portions to the view.
3. (Optional) On the **Select** ribbon tab, select the **All** tool in the **Beams** group.

   ![Image of Selecting All Beams]

   **Tip:** It is not necessary to select the members in order to perform the next steps. However, this can serve as an easy way to identify the edges of the slab-wall interface when selecting the vertices.

4. On the **Geometry** ribbon tab, select the **Wall/Slab Connection** tool in the **Structure** group.
5. Starting with the two nodes at the base, select the four corner nodes of the wall in a clockwise order, clicking on the first selected node a second time to complete the boundary definition.

The **Division along wall** dialog opens.

![Division along wall dialog](image)

**Note:** As the divisions along the base of the wall must be compatible with the slab density line, this value will control the meshing along the sides.

6. Click **OK**.
   
The default value of 10 divisions is sufficient for this example.

7. On the **Utilities** ribbon tab, select the **Plate Tools > Plate Connectivity** tool in the **Geometry Tools** group.
   
A message dialog opens indicating that no overlapping plates are found. This indicates also that the slab and wall are properly connected.
EX. Building Planner Workflow Example

This short tutorial will guide you through the creation of a small two-story concrete frame building using the Building Planner workflow.
EX. Create the model and plan details

1. On the Start page, select **New**. The New page opens to the **Model Info** tab.
2. Type **Building Example** in the **File Name** field and then select a **Location** to store the file.
3. Select the **Building** option for the **Type** of model.
4. Select **Metric** for the **Units**.
   
   **Note:** You can use either system of units in the STAAD.Pro Analytical Workflow once you generate the analysis model. However, the Building Planner application only operates in metric units.
5. (Optional) Select the **Job Info** tab to add project member names, dates, project description data, etc. You can also associate your STAAD project with a ProjectWise Project here.
6. Click **Create**.

The STAAD.Pro window closes and the STAAD Building Planner application opens. The **Start** dialog opens.

7. Provide the project details:
   a. Type **Building Example** in the **Project** field.
   b. Type **Demo** in the **Client** field.
   c. Type your name or initials in the **Engineer** field.
   d. Type **2** in the **No. of Levels** field.
   e. Type **5 (m)** in the **Founding Depth** field.
Application Examples
EX. Modeling Examples

This value is the distance from the top of foundations to the first floor.

8. Click **Create Project**.  
The **New Plan** dialog opens.

9. Enter in the plan details and assign it to the levels:
   a. Type 4 (m) in the **Height of Level Above** field.
   b. Click in the **Assign Levels** drop-down list and then click in the fields for both levels 1 and 2 such that **Plan1** is displayed there.

   This action assigns the typical plan to both levels.

   c. In the **Import Plan** group, select the **Create Plan Graphically** option.

   You will use the graphical interface to create a simple plan in this tutorial. 

   Leave the remaining options in the dialog their default values.
10. Click Create Plan. The Slab Details (Rectangle) dialog opens.

Proceed to the next set of steps to generate the slab.

EX. Create the slab layout

This procedure continues from the previous steps in which you created the model and plan details in building planner.

1. In the Slab Details (Rectangle) dialog, type 7 (m) in the Breadth (B) field.

   This updates the slab loading direction diagram in the dialog. Leave all other fields and options their defaults.
2. Click **OK**.
   A single slab section is added to the graphical view.

3. Select **Slab > Create Slab Rectangle**.

4. Click inside the existing slab near the top, left corner.
   A rectangular window is now pinned to the nearest corner and "rubber banded" to your mouse pointer.

5. Click at a point near where you want the opposite corner of the slab section placed.
   This should roughly be in line with the existing slab edge.
   The **Slab Details (Rectangle)** dialog opens. The same parameters from your first slab are entered.

6. Either:
   - click **OK**
   - or
   - press **<Enter>**
   The new slab section is added adjacent to the existing slab edge.

7. Repeat steps 5 and 6 to complete the 2 bay by 3 bay slab area.
Tip: You do not need to reselect the tool from the menu as it remains active after you create a slab.

Click the Save tool to save your progress so far.

EX. Add the beams and columns

1. Select Beam > Auto Beam.
   The Auto Beam Detail dialog opens.
2. Customize the beam properties to use:
   a. Type 0.30 (m) for the Internal Beam Breadth.
   b. Type 0.25 (m) for the External Beam Breadth.
   Leave the remaining parameters their default values.
3. Click **OK**. The beams are automatically added around the slab panel edges.
4. If the Select Beam to Break dialog opens, break the beams spanning 7 m. That is, such that the girder spanning horizontally on the screen is continuous.
5. Repeat step 4 if necessary.
6. Select **Column > Auto Column.**
   Square columns are automatically added at each beam intersection.

**EX. Check for errors and align columns**

1. Perform error checks:
   a. Select **Analysis > Slab Error Check.**
      This should result in no warnings or messages.
   b. Select **Analysis > Beam Error Check.**
      This should result in no warnings or messages.
2. Select **Analysis > Finalize Plan (with Continuity).**
   A message dialog confirms the plan is finalized.
3. Select **Workspace > 3D Frame.**
   If the **3D View** window opens, close this window.
   
   **Note:** You are now in the frame workspace, which has different menu options.

4. Select **Assign > Column Sizing and Orientation.**
   The **Column Sizing** window opens.

5. Set the column offset so that the faces of the columns align with the faces of the exterior beams:
   a. Click Column C1 to select it (the top, left column).
   b. In the Column Offset And Beta Angle diagram, click corner 4 (the top, left corner).
   c. Click **Update Offset Data & Beta Angle.**
      The column face is aligned to this point on the beams.

6. Repeat step 6 for each of the edge and corner columns, selecting the corresponding edge or corner for alignment.
7. Close the **Column Sizing** window.

**EX. Assign lateral load data and generate the analysis model**

1. Select **Assign > Wind Parameters**.
   The **Wind Parameters** dialog opens. Here you can select the appropriate Indian or American code for wind loads and assign parameters. For this example, you will accept the default parameters.
2. Select **IS 875-1987** from the **Design Code** drop-down and then click **OK**.

3. Select **Assign > Seismic Parameters**.
   The **Seismic Parameters** dialog opens. Here you can select the appropriate Indian or American code for wind loads and assign parameters. For this example, you will accept the default parameters.
4. Select **Analysis > Generate Analysis File**.
   The **Space Frame Generation** dialog opens.

5. Click **Generate**.
   A warning dialog asks to overwrite the existing file, click **Yes**.

The STAAD Building Planner window closes and the analysis model opens in STAAD.Pro.
All gravity loads, lateral loads, load combinations, and analysis commands have been added to the STAAD.Pro model. You can run the analysis in the Analytical Modeling workflow with no further actions necessary.

**EX. Steel Design Examples**

**EX. Connection Design Example**

This short tutorial presents an overview of design and detailing several steel connections.
This example uses US Example no. 7, which is included with the installation of STAAD.Pro.
EX. To start the Connection Design workflow

To open the example file in the Connection Design workflow, use the following procedure.

Using the Connection Design workflow requires a RAM Connection license. This license can incur additional cost to your organization.

1. a. Close any open model files in STAAD.Pro.
   b. On the Start page, check RAM Connection in the Additional Licenses panel.
      The Additional License Selected message opens to indicate that this can incur additional cost.
   c. Click Yes to activate this license for STAAD.Pro.
2. Open the file example file US.7. Modeling Offset Connections in a Frame.std in the Analytical Modeling workflow.
   This file is typically found in the C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US\ directory.
3. (Optional) On the View ribbon tab, 3D Rendering tool in the Windows group.

   This view is useful to quickly identify the orientation of the columns with respect to the framing beam members. Here, it is evident that the beams and brace frame into the column flanges (rather than the webs).
4. Either:
   Select the Run Analysis tool in the Analysis group on the Analysis and Design ribbon tab.
or

Press <CTRL+F5>

The STAAD Analysis and Design dialog opens.

During the analysis (and design, if specified), an output file is generated. This file may contain selected input data items, results and error messages. Optional print specifications can be used to include additional information in the output file.

5. Click Done.

6. Select the Connection Design workflow.
   The RAM Connection - Validation dialog opens.

7. Click Close.

EX. To design the roof beam to column connections

1. Hold <Ctrl> and select both upper columns and the roof beam (members 3, 4, and 6).

2. On the Connection Design ribbon tab, select the Smart Connection tool in the Assign Connections group.
The Smart Connections dialog opens.

3. Select AISC 360-10 (ASD) as the Design Code.
   Leave all other options unchecked.

4. Select Clip Angle BCF (Clip Angle, Beam-Column(Flange)) from the connection types drop-down list.

5. Double-click DA BCF All bolted in the Available list.
   It is added to the Selected list.

6. Click OK.
   The RAM Connection - Validation dialog opens to display the design results overview.

7. Click Close.
   The connection design is added to the RAM Connection Input table.

EX. To design the floor beam to column connection

1. Hold <Ctrl> and select both the left column sections and the floor beam (members 1, 3, and 5).

2. On the Connection Design ribbon tab, select the Smart Connection tool in the Assign Connections group.

   The Smart Connections dialog opens.

3. Select AISC 360-10 (ASD) as the Design Code.
   Leave all other options unchecked.
4. Select Unstiffened Seated BCF (UnStiffened Seated, Beam-Column(Flange)) from the connection drop-down list.

5. Double-click BCF Bolted in the Available list. It is added to the Selected list.

6. Click OK. The RAM Connection - Validation dialog opens to display the design results overview.

7. Click Close. The connection design is added to the RAM Connection Input table.

EX. To design the brace gusset plate connection

So far, you have selected members which form a joint for design. In this procedure, you will use some of the quick selection tools in the program which can be used to select all joints of a similar type.

1. On the Connection Design ribbon tab, select the Select Joints > Select all Column-Beam-Brace Joints tool in the Assign Connections group. Members 1, 2, 4, 5, and 7 are selected.

2. Hold <Ctrl> and then click the lower, left column section to remove it from the selection set. The lower end of the brace ends at a support so a separate connection design incorporating the base plate is needed.

Application Examples
EX. Steel Design Examples

4. Select AISC 360-10 (ASD) as the Design Code. Leave all other options unchecked.
5. Select Gusset Plate CBB (Gusset Plate, Column-Beam-Brace) from the connection types drop-down list.
6. Double-click the CBB_DW_CBF entry in the Available list. This is a Column-Beam-Brace connection, directly welded, at the column and beam flanges. It is added to the Selected list.
7. Click OK. The RAM Connection - Validation dialog opens to display the design results overview.
8. Click Close. The connection design is added to the RAM Connection Input table.

EX. To design the gusset base plate connection

1. Hold <Ctrl> and select the lower-left column segment and the brace (members 1 and 7).

2. On the Connection Design ribbon tab, select the Gusset Connections tool in the Assign Connections group.

The Gusset Connections dialog opens.
3. Select AISC 360-10 (ASD) as the Design Code. Leave all other options unchecked.
4. Select Gusset Base Plate from the connection types drop-down list.
5. Click [>>] to include all options in the Selected list. In this case, there is only a single Gusset BP type.
6. Click **OK**.  
   The RAM Connection - Validation dialog opens to display the design results overview.

7. Click **Close**.  
   The connection design is added to the **RAM Connection Input** table.

### EX. To change detailing of a connection

1. In the **RAM Connection Input** table, double-click the row for connection number 3 (connection BCF - N(3) - M(1,5)).

   ![Connection Input Table](image)

   **Tip:** You can also use the **Joint Cursor** tool in the **Connection Design** ribbon tab to double-click on a joint in the View window.

   The **Connection Pad** window opens. This window contains the details of the current connection design as well as a 3D rendering.

2. In the right details pane, select the Seat angle in the Unstiffened seated section.  
   The default design is a relatively small seat angle and larger top angle.

3. Select an **L40408** for the **Seat angle section** and then click **OK**.
The design, connection detailing, and drawing update immediately.

4. Click the **Results** tool to display the design checks report.

5. In the Report window, select the show Formulas tool.
The report updates with the calculations for each check.

   **Tip:** You can export either format to a Microsoft Office Word document. Including formulas significantly increases the length of the report.

6. Select the **Exit** tool to close the report window.

7. Select the **Save** tool.

8. Click the [X] to close the **Connection Pad** window.
The design is updated in the **RAM Connection Input** table.

**EX. To generate a report of the connection designs**

1. On the **Connection Design** ribbon tab, select the **Connection Report** tool in the **Reports** group.

   ![Diagram](image)

   The **RAM Report Export** dialog opens.
2. Select the **Grouped by Identical Connections** options.
   The two BCF connections for the roof beam are grouped together.

3. Click **Select All**.
   Leave the other options their defaults: include Data Report, Results Report with Formula, and in a merged reports format.

4. Click **OK**.
   The report is generated and saved to a Microsoft Office Word document (EXAMP07_report.doc) in the same folder as the STAAD input file.

5. Click **OK**.

   **Tip**: You can also add a summary table of the connection design results to your STAAD report.

---

**EX. Connection Tags Example**

This example demonstrates applying and checking connection tags.

**Connection Tag Data**

Use the **Copy to clipboard** button below to copy and paste this connection data into an empty text file and then save it as Connection_Tag_Example.xml to a convenient location.

**Tip**: The default location for connection tag data in STAAD.Pro can be found at

%LOCALAPPDATA%\Bentley\Engineering\STAAD.Pro CONNECT Edition\Default\Plugins \ConnectionTagLink.

```xml
<?xml version="1.0" encoding="utf-8" ?>
<ConnectionTagFile>
  <FileVersion value="1.0" />
  <Categories>
    <Category CategoryName="MOMENT">
      <CategoryDesc>End Moment Connection</CategoryDesc>
    </Category>
    <Category CategoryName="SHEAR">
      <CategoryDesc>Single Shear Connection</CategoryDesc>
    </Category>
  </Categories>
  <Equations>
    <Equation EquationID="Eq1" Equation="(abs([Mz])+([alpha]*abs([Fx])))/[Mz.cap]" Condition="LT" Limit="1.0" />
    <Equation EquationID="Eq2" Equation="abs([Fy])/[Fy.cap]" Condition="LT" Limit="1.0" />
    <Equation EquationID="Eq3" Equation="(abs([Fy])+([alpha]*abs([Fx])))/[Fy.cap]" Condition="LT" Limit="1.0" />
  </Equations>
  <Tags>
    <Tag TagName="EM" CategoryName="MOMENT">
      <EndRelease FX="0" FY="0" FZ="0" MX="0" MY="0"MZ="0" />
      <Capacities UnitSystem="IMPERIAL">
        <Beam Name="W12x26">
          <BeamOrCol Name="W14x90" Mz.cap="700" Fy.cap="65" Fx.cap="" alpha="0.10" />
        </Beam>
      </Capacities>
    </Tag>
  </Checks>
</ConnectionTagFile>
```
Note: This is an extremely short connection data example for the purposes of demonstration. A typical connection data file would contain a very large number of connection capacities for checking.

EX. To open the example and load example connection data

Copy and save the example connection tag data presented in the previous topic before proceeding.

1. Open the file example file US.7. Modeling Offset Connections in a Frame.std in the Analytical Modeling workflow.
This file is typically found in the C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\US\directory.

2. On the Utilities ribbon tab, select the Connection Tags > Open Tab Specifications tool in the Tools group.

   The Select Connection Tag File dialog opens.

3. Navigate to the Connection_Tags_Example.xml file and click Open.
   This file can be found where you saved it in the previous topic.

EX. To assign the connection tag types to beam ends

1. Select both beams 5 and 6.

   Tip: Press <Shift+B> to display the beam numbers.

2. On the Beam Tools ribbon tab, select the Assign tool in the Connection Tags group.

   The Assign Connection Tags and New Connection Tag dialogs open.

3. In the New Connection Tag dialog, select the options to generate the tags:
   a. Select EM from the Select Tags drop-down list.
   b. Select both Start and End options for the Location.
   c. Click Assign.
   The dialog closes and the two tags are added to the Assign Connection Tags dialog, assigned to the members.

   Note: There are two tags generated, one for the beam start and another for the beam end.

4. Click Close on the Assign Connection Tags dialog.

EX. To check the connection tags

1. On the Utilities ribbon tab, select the Connection Tags > Check Tags tool in the Tools group.

   The Assign Connection Tags and Check Connection Tags dialogs open.

2. In the Check Connection Tags dialog:
   a. Check the option for the 1 - WIND LOAD load case.
   b. Click Check.
   The Connection Tag Check Results dialog opens.
3. (Optional) Click the **Print** tool to open the print Preview window, where you can save a copy of the connection tag results table.

**EX. Connection Tags Example 02**

This example demonstrates applying connection tags using RAM Connection templates for mapping connections designed per AISC code to connection tags.

An industrial steel frame structure consists of several member types, including W shapes, tubes, and channels.

**EX. Data Files**

Save the following data as files for use with this example.

Save the following file contents to a convenient location on your computer.
1. Copy and save the following data to a file named ConnectionTagsExample02.std:

STAAD.Pro 6843 User Manual
Application Examples

EX. Steel Design Examples

3. In STAAD.Pro, open the file ConnectionTagsExampl02.std.

EX. Add the connection tags definition file

1. On the Utilities ribbon tab, select the Connection Tags > Open Tag Specifications tool in the Tools group. The Select Connection Tag File dialog opens.
2. Navigate to and select the connection tags definition XML file, ConnectionTagsData.xml.
   
   Tip: This connection tags definition XML file contains the associated RAM Connection types to use for each connection tag.
3. Click Open.

EX. Assign connection tags to beam ends

1. Select members 17 and 20.
   Hold <Ctrl> and then click on the members individually.
   
   Tip: Press <Shift+B> to display the member numbers.
2. On the Beam Tools ribbon tab, select the Assign tool in the Connection Tags group. The New Connection Tag and Assign Connection Tag dialogs both open.
3. In the New Connection Tag dialog, select SMART-BCF from the Select Categories drop-down list and then select FW-BCFS from the Select Tags drop-down list.
4. Check both the **Start** and **End** options.
5. Click **Assign**.
   The connection tag assignments are added to the table in the **Assign Connection Tags** dialog. There are two entries in the table, one for both the start and end connection.
6. In the View Window, click on member number 18 to select it.
7. In the **Assign Connection Tags** dialog, click the **New** tool.
   The **New Connection Tag** dialog opens.
8. Select **SMART-BCF** from the **Select Categories** drop-down list and then select **FP-BCFS** from the **Select Tags** drop-down list.
9. Check both the **Start** and **End** options.
10. Click **Assign**.
    The connection tag assignments are added to the table in the **Assign Connection Tags** dialog.
Repeat this procedure to assign the following connection tags in the model:

<table>
<thead>
<tr>
<th>Member Numbers</th>
<th>Categories</th>
<th>Tags</th>
<th>Locations</th>
</tr>
</thead>
<tbody>

#### EX. Assign gusset connection tags to columns

1. **Assign the column member types:**
   a. On the **Select** ribbon tab, select the **Parallel > Y** tool in the **Beams** group.
   All the vertical members (parallel to the global Y axis) are selected.
   b. On the **Beam Tools** ribbon tab, select the **Add Attribute** tool in the **Plugins** group.
   The **Member Attribute** dialog opens.
   c. Select **MEMBTYPE** from the **Attribute Name** drop-down list and then select **COLUMN** from the **Attribute Value** drop-down list.
   d. Click **Apply**.

2. **Assign the brace member types:**
   a. On the **Select** ribbon tab, select the **List** tool in the **Beams** group.
   The **Select Beams** dialog opens.
b. Select the Select using typed list option.
c. Type the following list in the text field: 30 TO 33 35 TO 38 43 44 46 47 85.

**Tip:** You can also copy and paste this list using keyboard commands.

d. Click Select Listed Entities.
e. Add the MEMBTYPE attribute of BRACE to these members, similar to what you did in step 1.

3. Select members 7 8 26 37 and 38.

**Tip:** You can hold the <Ctrl> key which clicking on these members individually or use the list selection option from Step 2.

4. On the Beam Tools ribbon tab, select the Assign tool in the Connection Tags group.
   The New Connection Tag and Assign Connection Tag dialogs both open.

5. In the New Connection Tag dialog, select GUSSET-CBB from the Select Categories drop-down list and then select DA-CBB from the Select Tags drop-down list.

6. Check the End option only.

7. Click Assign.

Repeat this procedure (steps 3 through 7) to assign the following connection tags in the model:

<table>
<thead>
<tr>
<th>Member Numbers</th>
<th>Categories</th>
<th>Tags</th>
<th>Locations</th>
</tr>
</thead>
<tbody>
<tr>
<td>7 8 26 37 38</td>
<td>GUSSET-CBB</td>
<td>DA-CBB</td>
<td>End only</td>
</tr>
<tr>
<td>85</td>
<td>GUSSET-CBB</td>
<td>DW1-CBB</td>
<td>Start only</td>
</tr>
<tr>
<td>85</td>
<td>GUSSET-BP</td>
<td>GT-BP</td>
<td>End only</td>
</tr>
<tr>
<td>32 33 35 46 47</td>
<td>GUSSET-BP</td>
<td>GT-BP</td>
<td>Start only</td>
</tr>
<tr>
<td>33</td>
<td>GUSSET-VXB</td>
<td>G1-VXB</td>
<td>End only</td>
</tr>
<tr>
<td>34 45</td>
<td>GUSSET-CVR</td>
<td>G1-CVR</td>
<td>Start only</td>
</tr>
<tr>
<td>70 71</td>
<td>BASIC-COL</td>
<td>EP-CS1</td>
<td>End only</td>
</tr>
<tr>
<td>30</td>
<td>GUSSET-HXB</td>
<td>G1-HXB</td>
<td>Start only</td>
</tr>
<tr>
<td>30</td>
<td>GUSSET-HBBB</td>
<td>G1-HBBB</td>
<td>End only</td>
</tr>
<tr>
<td>21 43</td>
<td>GUSSET-HCBB</td>
<td>G1-HCBB</td>
<td>End only</td>
</tr>
</tbody>
</table>

EX. Analyze, design, and export connection data

1. On the Analysis and Design ribbon tab, select the Run Analysis tool in the Analysis group.
   The STAAD Analysis and Design dialog opens and the analysis is performed.

2. Click Done.

3. Select the Connection Design dialog opens.

4. Click OK.
The connections are designed based on the connection tag mappings in the XML file. The results of the connection design process is displayed in the RAM Connection Input table.

You can double-click any row in this table to open the connection pad. From there, you can review the connection design details and make changes as needed.

5. Select File > ISM and then select Create Repository.
   The STAAD.Pro CONNECT Edition ISM Module dialog opens and then you are prompted to save the repository to the same base name and file location as the STAAD input file.

6. Click Save.

7. Check that the Open Structural Synchronizer option and Include Member Offsets option are both checked.

8. Click the Run tool.
   If you are prompted again to create the repository file, click Yes.

9. In the iTwin Analytical Synchronizer application, select the Select All tool for Objects and then click Update.

10. Type an option commit message and then click OK.
   The repository is created and the model data is pushed to it. The iTwin Analytical Synchronizer application closes.

11. In the STAAD.Pro CONNECT Edition ISM Module dialog, click OK in the prompt and the close the dialog.

You now have an ISM repository that can be used to transmit connection detailing designed in STAAD.Pro and RAM Connection to detailing software, such as ProStructures.

EX. Interactive Concrete Design Examples

This is an example of using the interactive Concrete Design workflow to design an example concrete structure.

EX. Advanced Concrete Design Tutorial

Getting Started

STAAD Advanced Concrete Design is performed using the RCDC application, which is installed separately from STAAD.Pro. This program can be launched from the STAAD.Pro Building Designer mode or as a standalone application.

RCDC is a highly automated design tool for concrete building structures. This tutorial guides you through the process of designing the elements in a concrete building. It will also indicate where to change the design settings to customize design and detailing to meet the requirements of your project or organization.

Tutorial File

This tutorial uses example files that are installed with STAAD.Pro V8i. However, you will be making changes to this example file so you may wish to make a backup copy to preserve the example as installed with STAAD.Pro. A copy of the original input file is also included as Tutorial STAAD Input File (on page 6879) of this tutorial.
Application Examples
EX. Interactive Concrete Design Examples

Starting in STAAD.Pro
This example includes a fully modeled concrete structure, including loads. The modeling and application of loads per a building code specification are outside the scope of this tutorial. Refer to the STAAD.Pro help contents for additional information.

Using RCDC as a Standalone Application
You can also use RCDC as a standalone application for concrete design. You will still need to have a analytical model created in STAAD.Pro for the basis of the physical model as well as for analytical results.
Design and detailing of foundation elements such as footings and pilecaps must be performed by starting RCDC as a standalone application and creating a project associated with an analytical model.

To open the model and generate analysis

1. Open the STAAD input file
   C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\Building Planner\Typical Ground +3 Story Building.std

2. (Optional) On the File ribbon tab Info tab, add job information:
   type Tutorial in the Job field
   type your organization's name in the Client field
   type your initials in the Engineer field

3. Either:
   on the Analysis and Design ribbon tab, select the Run Analyze tool in the Analysis group
   or
   press <Ctrl+F5>
   The analysis is performed.

4. Select the Stay in Modeling Mode option and click Done.
5. Select the Building Planner workflow. The STAAD Building Planner window opens.

The STAAD Building Planner will be used to layout the structure.

To create a building model from floor plan

In order to demonstrate column design in RCDC, you will use the Building Planner model rapidly model a building from a single floor plan.

1. Select the Frame | Geometry page.
2. Click Edit in the Level Details dialog. The Level Information dialog opens
3. Type 6 (m) in the Height cell for row No 0-1 and press <Enter>. 
4. Click Add Level and then click Yes in the confirmation dialog. A new row is added representing a new level.
5. Select Plan 1 from the Plan drop-down list for the second level. Leave the default heights and other values for this level.
6. Click OK.
7. In the Level Details dialog, click Generate Model and then click Yes to confirm you want to update the STAAD input model.
   The Space Frame File Generation dialog opens.
8. Click **Generate**.
   For this tutorial, you will use the default settings, load settings, and building type. Refer to the STAAD.Pro User Interface help for details on these settings.
   The new input file is generated and opened.

9. Either:
   - select **Analyze > Run Analysis**
   - or
   - press `<Ctrl+F5>`
   The analysis is performed.

10. Select the **Stay in Modeling Mode** option and click **Done**.

To add a shear wall

To add a shear wall along one side of the elevators, do the following.

For the purpose of this tutorial, you will only add a single shear wall. In a typical building, other shear walls would be present.

1. In the Building Planner mode, select the **Frame | Shear Wall** page.
2. In the **Shear Wall Details** dialog, click **Edit**.
3. Click on column C31 and then on C32.
The Define Shear Wall dialog opens.

4. Click OK.
   For this tutorial, use the default thickness. The shear wall is added on both levels using this plan by default.

You have now finished all the necessary modifications to this example for this tutorial. The next sections cover the design and detailing of structural elements using RCDC.

**Slab Design**

This section of the tutorial demonstrates how to design and detail a slab, including openings and stairs.

Slab continuity is based on edge conditions which are automatically determined by the program. You can manually change the end conditions of a slab. You can also change a slab to a cutout, raised slab, or depressed slab which also affect the edge conditions.

Slab properties are imported from the analysis model where specified. The program will evaluate missing properties (e.g., slab thickness) during design when not specified.

**To start the slab design**

**Tip:** When you import STAAD.Pro model data into RCDC, grids are automatically detected and assigned. You can manually edit both the exact locations of grids as well as grid labels in RCDC for drawing generation.

1. In the top-right dialog, select **Level : 1** from the drop-down list and then click **Design Slab**.
RCDC opens and the **New Project** dialog opens.

2. Enter the project data:

   a. Type **Tutorial** in the **Project** field.

   b. (Optional) Type **Client** and **Engineer**, name.

      This information is used as the header for all reports. It will be automatically imported from the STAAD.Pro input file Job Information block if available.

   c. Select **EN 02 - 2004** from the **Design Code** drop-down list.

      This tutorial uses the Eurocode. However, you can select any available code. Just note that some design settings and features may vary based on the code selection made here.

The slab edges are automatically detected and continuity is established.
3. Either:

select the **Design Parameters** tool

or

select **Settings > Design Parameters**

The **Design Settings** dialog opens.
4. In the Available Rebar list, clear the check mark by 25 (mm). This tutorial will limit the rebar size.

**Note:** All other design settings are left as their defaults, but you can make many design and detailing changes here.

5. Click **OK**.

6. Either:

   - select the **Crack Width Setting** tool

   or

   - select **Settings > Crack Width Settings**

The **Crack Width Settings** dialog opens.
7. Select the **Perform Check** option in the **Crack Width** group.

   **Note:** Leave the Permissible Crack Width as the default value and leave the Perform Check option in the Initial Thermal Cracking group unchecked for this tutorial.

8. Click **OK**.

**To specify elevator openings**

Since the analysis model does not contain openings in the slab, you can add those in RCDC.

**Note:** RCDC can design and detail concrete stairs with the slab. Do not create an opening for the stairs if you plan to use this feature. Refer to the RCDC help topic **Slab > Staircase Section** for details on this feature.

1. In the Design Data table, select row 19 (for Slab 18).
   The slab is highlighted in the Slab Layout view window.

2. Do either of the following:
   - select **True** in the **Is Cut Out** cell for this row in the table
   - right-click on the slab in the view window and select **True** from the **Is Cut Out** drop-down in the pop-up menu
The slab is now marked as a cutout.

3. Select Modify > Re-evaluate Slab continuity.

**Note:** This will change the continuity of surrounding slabs. If you do not perform this step, you will be prompted to automatically re-evaluate the continuity before performing an autodesign.

To perform the design

Slabs in RCDC are designed for the **Imposed Load** and **Live Load** values input for each slab on the **Design Data** table. These values are imported (along with thickness, etc.) from the slab parameters specified in STAAD.Pro Building Planner mode.

1. Either:
   - select the Autodesign tool
   - or
   - select Design > Autodesign.
     A message dialog opens confirming you want to proceed since the continuity must be reevaluated if you have not already done so.

2. If you did not previously reevaluate the continuity, click Yes.
   The Design Output page opens.
   A warning message opens stating that two of the slabs have failed the design checks. The same slab is marked with a red row number in the table.

3. Select the row for the first failed slab (row 13, S24) in the table and then either:
   - select the Design tool
   - or
   - select Modify > Design
   - or
   - right-click and select Design from the pop-up menu
The **Design Slab** dialog for this slab opens at the bottom of the program window.

4. Type 325 (mm) in the **Thickness** field in the **Design Parameters** group.

5. Select the **Design** tool in the **Design Slab** dialog.
   The slab now passes the design checks.

6. Select the **Accept** tool to update the design with the changes.

7. Repeat steps 3 through 6 for S17 (row 24) with a thickness of 200 (mm).

To generate construction and detail drawings

1. Generate a GA drawing for the slab:
   a. Select **Reports > General Arrangement Plan**. 
      The **GA Drawing** view window opens.
   b. Click the **Save** tool in the view window.
   c. Type **Sample_Slab_GA.dxf** and click **Save** to save the GA drawing as a DXF file.

2. Generate a schedule:
   a. Either:
      - select the **Text Schedule** tool
      or
      - Select **Reports > Text Schedule**.
      A dialog opens to ask if you want to group similar slabs.
   b. Click **Yes**.
      The **Text Schedule** view window opens.
   c. Click the **Save** tool in the view window.
   d. Type **Sample_Slab_Sched.dxf** and click **Save** to save the schedule as a DXF file.

3. Generate the reinforcement layout drawings:
   a. Either:
      - select the **In-Plan Detailing** tool
      or
      - Select **Reports > In-Plan Detailing**.
      The Top Reinforcement and Bottom Reinforcement drawings open.
   b. Click the **Save** tool in the view window.
   c. Type **Sample_Slab_TopReinfPlan.dxf** and click **Save** to save the schedule as a DXF file.
   d. Repeat steps 4b and 4c to save the bottom reinforcement plan as **Sample_Slab_BotReinfPlan.dxf**.

4. Generate a bill of quantities:
   a. Either:
      - select the **Bill of Quantities** tool
      or
      - Select **Reports > Bill of Quantities**.
      The **Bill Of Quantities** dialog opens.
b. Select the **BOQ Summary** option.
c. Select **€ - Euro** from the **Currency** drop-down list.
d. Type 90 (€/m$^3$) for Grade C20/25 concrete and 4 (€/kg) for Grade Fy420 steel. Type 8 (€/m$^2$) for the Shuttering value.
e. Click **OK**.  
The **BOQ Summary** opens.
f. Either:
   
   click the **Print** tool to print out a copy of this report
   
or
   
   click the **Save** tool to save an HTML copy of this report

---

To generate design calculation reports

1. Either:
   
   select the **Design Summary** tool
   
or
   
   select **Reports > Design Summary**
   
   The **Slab Design Summary** opens.

2. Either:
   
   select the **Design Calculations** tool
   
or
   
   select **Reports > Design Calculations**
The Select Slabs dialog opens.

3. Check the boxes for S1 and S12.
   For this tutorial you will only output the detailed design for two slabs. You can check the All Slabs option to include the full design report.

4. Click OK.
   The Slab Design opens.

5. Either:
   - click the Print tool to print out a copy of this report [Image]
   - or
   - click the Save tool to save an HTML copy of this report [Image]

To save the project and exit

1. Either:
   - select the Save tool (on the main program toolbar) [Image]
   - or
   - select File > Save
     The Save As dialog opens.
2. Type Sample1_Slab_tutorial.rcdx in the filename and click Save.
   RCDC closes and you are returned to STAAD.Pro.

RCDC Settings Files

When you save your project in RCDC, in addition to the project file (.rcdx) a project settings file is also created (.rcps). You can select File > Import Project Settings to open the project settings for a previous project once you have established project or office standards you want to re-use.

Beam Design

This section of the tutorial demonstrates how to design and detail continuous concrete beams.

RCDC will automatically look for continuous beam members in the STAAD model and group these as a single physical beam. This way if you have a beam which continuous through columns or one which was sub-divided into STAAD.Pro to facilitate support of a transverse member, it will be designed as a single beam entity in RCDC.

In this example, you will use most of the default values for all designs.

To start the beam design

In STAAD.Pro, ensure you are on the Frame | Design page in the Building Planner mode.

**Tip:** When you import STAAD.Pro model data into RCDC, grids are automatically detected and assigned. You can manually edit both the exact locations of grids as well as grid labels in RCDC for drawing generation.

1. In the top-right dialog, check the Level :1 option and then click Design Beams.
RCDC opens and the **New Project** dialog opens.

2. Enter the project data and select the design code:

a. Type **Tutorial** in the **Project** field.

b. (Optional) Type **Client** and **Engineer** name.

   This information is used as the header for all reports. It will be automatically imported from the STAAD.Pro input file Job Information block if available.

c. Select **EN 02 - 2004** from the **Design Code** drop-down list.

   This tutorial uses the Eurocode. However, you can select any available code. Just note that some design settings and features may vary based on the code selection made here.

The beam continuity is automatically detected as the analytical model data is read.

3. Either:

   select the **General and Reinforcement Settings** tool

   or

   select **Settings > General and Reinforcement Settings**

   The **General and Reinforcement Settings** dialog opens.
4. In the Rebar list, clear the check mark by both 32 (mm) and 40 (mm). The initial design will be evaluated using smaller size bars where possible.

**Note:** All other design settings are left as their defaults, but you can make many design and detailing changes here.

5. Click OK.

**Note:** There are numerous other detailing and drawing settings in RCDC that allow you to customize the concrete detailing for your client or organization’s needs. For details on these options, refer to the RCDC help by pressing <F1> or selecting Help > Contents.

To specify load cases and combinations

1. Select Settings > Basic Load Cases
   The Basic Load Cases dialog opens.

2. (Optional) If the Load Type selection is not already specified for each load case, select it from the drop-down list:
3. (Optional) If both loads are not already added to the Primary Load Cases list, click the [+ ] button when a load case is selected in the Analysis Load Cases list to add it.

  **Note:** You can import previously saved load cases and combinations to use by clicking the **Import Load Cases & Combinations** button and selecting an .ldsx file. Refer to the following steps on how to create a load settings file.

4. Click **OK**.
   The **Load Combinations** dialog opens.

5. Click **Add From Analysis**.
   The load combination from the analysis file is added for strength design checks.

6. Add the load combination for use in evaluating crack width:
   a. Select the **Crack Width** tab.
   b. Click **Add From Template > For Regular Structure**.
      A service level load combination is added from the RCDC load combinations template.

      **Note:** Typically, a different (service level) load combination is used for evaluating crack widths. If you already have appropriate service load combinations in your analytical model, you can add those instead and select them for use here.

   c. Check the options for **Crack Width** and **Stress Limit** in the load load combination in the table.

7. Export the load cases and combinations for later use:
   a. Click **Export Load Cases & Combinations**.
      The **Save As** dialog opens.
   b. Type **Sample1_Loads** and click **Save**.

8. Click **OK**.

To split beam group at staircase

1. Select the **Design Input | Beam Continuum** tab.
2. Select the third beam group in the chart.

   **Note:** The beams on grid line 6 are highlighted in the Layout view.

3. Right-click on the blue box labeled C17 (column 17) and select **Split Group** from the pop-up menu.
   The beam group is split into two physical members at this location.

4. Select the **Design Input | Design Grouping** tab.
5. Select **G19** in the table or click on the newly created beam group in the Layout view.
6. Type **-900** in the **Top** field for both beam segments in G19 (B14 and B15).
   This represents a top of beam elevation of 0.9m below the floor elevation.

To perform the beam design

1. Either:
   a. select the **Autodesign tool**
   or
select **Design > Autodesign**.

An exceptions dialog opens indicating that two beams have failed the design checks.

2. Click **OK**.

3. Either:

select the **Failure Diagnostics** tool

or

select **Reports > Failure Diagnostics**

The **Failure Diagnostics** tab opens. The table indicates that many beams are failing due detailing checks.

4. Evaluate some options for beam group 2:

a. Select any of the beam segments in **G2** in the Design Output table.

The beam segments in this group are marked with a red tag to indicate the group failed one or more checks.

b. Either:

select the **Design** tool

or

select **Modify > Design**

The **Redesign Grp** dialog opens at the bottom of the program window.

c. Type 3 in the **Bar Layers at Top** field.

d. Select the **Redesign** tool in the **Redesign Grp** dialog.
The beam now passes design and crack width checks.

**e.** Select the Accept tool. 

The Design Output table now shows green for the G2 beam indicating it passes.

5. Repeat step 4 to redesign G7 with 3 layers of top bars as well.
   Optionally, you can use the UnLock tool to unlock the current design and then change the initial settings to use larger reinforcement sizes.

6. Review the detailing on the demand and capacity curve for a beam:

   **a.** Select beam group G1 and either:
      
      select the Detail tool or
      
      select Modify > Detail or
      
      right-click and select Detail from the pop-up menu
      
      The Redtail dialog opens at the bottom of the program window.

   **b.** Click-and-drag your mouse cursor over the beam subdivisions starting at 0.75L of the first beam span in G1.

   **c.** Right-click and select detail from the pop-up menu.
      
      The Top Steel pop-up dialog opens.

   **d.** Delete the N1 value for layer 4 and then select the empty value for D1 for the same layer.

   This will remove the fourth layer of bars from the top steel in this segment, creating a new reinforcement detail for the selected segment.

   **e.** Click OK.
      
      The section of the capacity curve for the top steel updates to reflect the detailing change.
f. Click Cancel.

Tip: You can use select the beam segments or entire reinforcement zones by their labels just below the diagram. You can copy and paste reinforcement details between zones or selections.

7. (Optional) Check for any resized beams during design by selecting Reports > Beam Size Changed.
   A report including any resized beams during design opens. For this example, none of the beams were resized.

To generate beam schedules and drawings

1. Generate a text schedule of beam reinforcement:
   a. Either:
      select the Text Schedule tool
   or
   Select Reports > Text Schedule.
   The Schedule Type dialog opens.
   b. Select the Type 1 option.
   c. Select the Group Beams option.
   d. Click OK.
      The Text Schedule view window opens.
   e. Click the Save tool in the view window.
   f. Type Tutorial_Beam_Sched.dxf and click Save to save the schedule as a DXF file.

2. Generate an elevation for any beam group:
   a. In the Design Output table, right-click on any beam group and select Quick Elevation from the pop-up window.
      The elevation drawing for this beam group opens in the lower section of the program window.
   b. (Optional) Select the Save tool in the Elevation view to save this view as a DXF file.
   c. Select the Cancel tool to close the elevation view

3. Generate the elevation and sections for a beam group:
   a. Either:
      select the Elevation and Section tool
   or
   Select Reports > Elevation and Section.
      The Select Beams dialog opens.
   c. Select the following Draw options:
Application Examples
EX. Interactive Concrete Design Examples

Elevation
Mark Anchorage
Cross section
Show Section Mark

Tip: You can modify the drawing and detailing options by clicking the Detailing & Drawing Settings button (also by selecting Settings > Detailing & Drawing Settings before using this tool). You can also customize rebar mark styles from this dialog.

d. Click OK.
The Elevation for the selected beam group opens.
e. Click the Save tool in the view window.
f. Type Tutorial_Beam_Sched.dxf and click Save to save the schedule as a DXF file.

4. Generate a bill of quantities:
   a. Either:
      select the Bill of Quantities tool
   or
   Select Reports > Bill of Quantities.
The Bill Of Quantities dialog opens.

   b. Select the BOQ Summary and Reinforcement Type Wise options.
   c. Select € - Euro from the Currency drop-down list.
   d. Type 90 (€/m³) for Grade C20/25 concrete and 4 (€/kg) for Grade Fy420 steel. Type 8 (€/m²) for the Shuttering value.
   e. Click OK.
The BOQ Summary and BOQ Detailed - Reinf Type Wise tabs open.
   f. Either:
click the Print tool to print out a copy of this report

or

click the Save tool to save an HTML copy of this report

5. Generate bar bending schedule:
   a. Select BBS > Generate BBS.
      The Generate BBS dialog opens.

      b. Select 1.B1-B2-B3-B4 and 2. B5-B6-B7-B8-B9 in the list of beam groups.
      c. Select the Continuous option in the Rebar Numbering group.
      d. Select both the Drawing and Spreadsheet options in the Schedule Format group.
      e. Click inside the file path field, type Tutorial_Beam_BBS in the Save As dialog that opens, and then click Save.
      f. Click Generate.
      The BBS opens containing a text schedule of the bar bending schedule. If you have Microsoft Office Excel® installed (or another spreadsheet program capable of opening .xslx format spreadsheet files), the spreadsheet of the bar bending schedule opens.
      g. Close your spreadsheet application.
      h. Click the Save tool in the view window.
      i. Type Tutorial_Beam_BBS.dxf and click Save to save the schedule as a DXF file.

To generate beam design calculations

1. Either:
   select the Design Summary tool

   or

   select Reports > Design Summary
   The Design Summary opens.
2. Either:
select the Design Calculations tool

or

select Reports > Design Calculations

The Select Beams opens.

For this tutorial you will only output the detailed design for two beam groups. You can check the All Beams option to include the full design report.

4. Click OK.

5. Either:

   click the Print tool to print out a copy of this report

   or

   click the Save tool to save an HTML copy of this report

To save the project and exit

1. Either:

   select the Save tool (on the main program toolbar)

   or

   select File > Save

   The Save As dialog opens.

2. Type Sample1_Beam_tutorial.rcdx in the filename and click Save.

   RCDC closes and you are returned to STAAD.Pro.

Column and Wall Design

This section of the tutorial demonstrates how to design and detail continuous concrete columns.

RCDC will make continuous physical columns out of collinear analytical columns modeled in the Building Planner mode in STAAD.Pro.

To start the column design

In STAAD.Pro, ensure you are on the Frame | Design page in the Building Planner mode.

Tip: When you import STAAD.Pro model data into RCDC, grids are automatically detected and assigned. You can manually edit both the exact locations of grids as well as grid labels in RCDC for drawing generation.

1. In the top-right dialog, click Design Columns.
RCDC opens and the **New Project** dialog opens.

2. Enter the project data:

   a. Type **Tutorial** in the **Project** field.

   b. (Optional) Type **Client** and **Engineer** name.

       This information is used as the header for all reports. It will be automatically imported from the STAAD.Pro input file Job Information block if available.

   c. Select **EN 02 - 2004** from the **Design Code** drop-down list.

       This tutorial uses the Eurocode. However, you can select any available code. Just note that some design settings and features may vary based on the code selection made here.

       The column continuity is automatically detected as the analytical model data is read.

3. Either:

   select the **Reinforcement Settings** tool 

   or

   select **Settings > Reinforcement Settings**

   The **Reinforcement Settings** dialog opens.
4. In the **Rebar** list, clear the check mark by both 32 (mm) and 40 (mm). The initial design will be evaluated using smaller size bars where possible.

5. Click **OK**.

**Note:** There are numerous other detailing and drawing settings in RCDC that allow you to customize the concrete detailing for your client or organization's needs. For details on these options, refer to the RCDC help by pressing <F1> or selecting **Help** > **Contents**.

**To import load cases and combinations**

In this procedure, you will import the load settings file you saved when **To specify load cases and combinations** (on page 6863).

1. Select **Settings** > **Basic Load Cases**.
   The **Basic Load Cases** dialog opens.
2. Click **Import Load Cases & Combinations**.
   The **Open** dialog opens.
3. Select the file **Sample1_Loads landslide** and then click **Open**.
   If you saved this file under a different name or in a different location, locate and select the file you created in the previous section.
   The previously selected load cases are added to the Primary Load Cases list.
4. Click **OK**.
The **Load Combinations** dialog opens. The previously selected load combinations from the analysis model are also already added.

5. Click **OK**.

**To perform the column design**

1. Either:
   - select the **Autodesign** tool
   - or
   - select **Design > Autodesign**.

   The **Failed Columns Dialog** dialog opens indicating that two columns have failed the design checks.

2. Click **OK**.

3. Either:
   - select the **Failure Diagnostics** tool
   - or
   - select **Reports > Failure Diagnostics**

   The **Failure Diagnostics** tab opens. The table indicates that the two beams have failed a detailing check.

4. Evaluate some options for column 12:
   a. Select the row for column **C12** from **6m TO 12m** in the column design table.
      This column is marked with a red tag to indicate it failed one or more checks.
   b. Either:
      - select the **Redesign Section** tool
      - or
      - select **Modify > Redesign Section**
      - or
      - right-click on the column row and select **Redesign Section** from the pop-up menu

   The **Redesign Column** dialog opens at the bottom of the program window.

   ![Redesign Column Dialog](image)

   c. In the Dia list, select **20 (mm)** and then in the Bars list select **3#**.
      This will place **20mm bars in groups of three in the section**.
d. Click on any of the *corner* bars in the cross section.
   The color-coded size of the grouped bars are added to each corner.

e. Repeat steps 4c and 4d to add single (1#) 20mm bars along the faces.

```
Note: Once you select number of bars, you only need to click twice in the section to update all the face bars.
```

f. Select the **Redesign** tool in the **Redesign Grp** dialog.
The column now passes design and detailing checks.

g. Select the **Accept** tool.

```
Tip: Right-clicking on a wall and selecting **Redesign Section** allows you to graphically detail a wall section in the same manner. Try this with W1 in the Column Design table as an extra excercise.
```

The Design Output table now shows green for the G1 beam indicating it passes.

5. Repeat step 4 to redesign the other failing column (C23).

6. Right-click on the second level column 12 (C12: 6m TO 12m) and select **Interaction Surface from the pop-up menu**.
The **Interaction Surface** dialog opens.
7. Review the interaction surface:

**Options** | **Description**
--- | ---
To display the interaction at critical points for a load combination | select that combination from the table
To view the interaction at any point along the column height | drag the slider to a specific load value
To control the view of the interaction surface | use the view controls at the top of the interaction surface view window

8. Click the X in top-right to close the Interaction Surface window.

To generate column schedules and drawings

1. Generate a text schedule of column reinforcement:
   a. Either:
      - select the Text Schedule tool
      - or
   Select Reports > Text Schedule > Type 1 (Ductile) Section.
   The Text Schedule view window opens.
   b. Click the Save tool in the view window.
   c. Type Tutorial_Column_Sched.dxf and click Save to save the schedule as a DXF file.

2. Generate detail drawings of columns:
a. Either:

select the Detailed Drawing tool

or

Select Reports > Detailed Drawing.

The Select Columns dialog opens.

b. Select 0m to 12m for the range of heights.

c. Select C1 and W1 in the columns list.

d. Click OK.

The Detailed Drawing opens with the Column and Wall Schedule.

e. Click the Save tool in the view window.

f. Type Tutorial_Col_Detail.dxf and click Save to save the schedule as a DXF file.

3. Generate the elevation and sections for a column:

a. Select Reports > Elevation.

The Select Columns dialog opens.

b. Select C1 and W1 in the columns list.

Tip: You can modify the drawing and detailing options by clicking the Detailing & Drawing Settings button (also by selecting Settings > Detailing & Drawing Settings before using this tool). You can also customize rebar mark styles from this dialog.

c. Click OK.

The elevation for the selected column and wall opens. This drawing contains section cuts at each reinforcement arrangement.
d. Click the Save tool in the view window.

e. Type Tutorial_Col_Elev.dxf and click Save to save the schedule as a DXF file.

4. Generate a bill of quantities:
   a. Either:
      
      select the Bill of Quantities tool
      
      or
      
      Select Reports > Bill of Quantities.
      
      The Bill Of Quantities dialog opens.
b. Select the **BOQ Summary** and **Reinforcement Type Wise** options.

c. Select **€ - Euro** from the **Currency** drop-down list.

d. Type 90 (€/m²) for Grade C20/25 concrete and 4 (€/kg) for Grade Fy420 steel. Type 8 (€/m²²) for the Shuttering value.

e. Click **OK**.

The **BOQ Summary** and **BOQ Detailed - Reinf Type Wise** tabs open.

f. Either:

  - click the **Print** tool to print out a copy of this report 📡

  or

  - click the **Save** tool to save an HTML copy of this report 📦

5. Generate bar bending schedule:

a. Select **BBS > Generate BBS**.

The **Generate BBS** dialog opens.

b. Select **C1** and **W1** in the list of columns groups.

c. Select the **Continuous** option in the **Rebar Numbering** group.

d. Select both the **Drawing** and **Spreadsheet** options in the **Schedule Format** group.

e. Click inside the file path field, type **Sample1_Col_BBS** in the **Save As** dialog that opens, and then click **Save**.

f. Click **Generate**.

The BBS opens containing a text schedule of the bar bending schedule. If you have Microsoft® Office Excel® installed (or another spreadsheet program cable of opening .xlsx format spreadsheet files), the spreadsheet of the bar bending schedule opens.

g. Close your spreadsheet application.

h. Click the **Save** tool in the view window. 📝

i. Type **Tutorial_Col_BBS.dxf** and click **Save** to save the schedule as a DXF file.
To generate column design calculations

1. Either:
   select the Design Summary tool
   or
   select Reports > Design Summary
   The Design Summary opens.
2. Either:
   select the Design Calculations tool
   or
   select Reports > Design Calculations
   The Select Columns dialog opens.
3. Select columns C1 and W1 in the columns list.
   For this tutorial you will only output the detailed design for one column and one wall. You can check the All Columns option to include the full design report. Or, if you only need the calculations for one level of a column or wall, you can expand that entry and select the level of interest.
4. Click OK.
5. Either:
   click the Print tool to print out a copy of this report
   or
   click the Save tool to save an HTML copy of this report

To save the project and exit

1. Either:
   select the Save tool (on the main program toolbar)
   or
   select File > Save
   The Save As dialog opens.
2. Type Sample1_Col_tutorial.rcdx in the filename and click Save.
   RCDC closes and you are returned to STAAD.Pro.

Tutorial STAAD Input File

The following input file for STAAD.Pro is included with the installation of the product. It is included here as well.

```
UNIT METERS MTONS
JOINT COORDINATES
```

```
STAAD SPACE ...
** FILE CREATED ON : (19-09-2018, 02:49:43 PM)
** FILE IS GENERATED USING PlanWin
** PlanWin FILE : C:\Users\Public\Documents\STAAD.Pro CONNECT Edition\Samples\Sample Models\Building Planner\Typical Ground +3 Storey Building.plnx
```

EX. Bride Deck Loading Example

This example demonstrates how to apply vehicle loads per BS 5400 Part 2 on two lanes of a two span, steel girder bridge using the Bridge Deck workflow.

EX. To open the model in Bridge Deck workflow

1. Create a new file in STAAD.Pro.
2. Open the file and copy/paste the EX. Bridge Deck Loading Input File (on page 6936).
3. Run an analysis on the structure.
4. Select Bridge Deck in the Workflows panel.

   Note: If you do not have a license for this module, you will not be able to proceed.

   The Bridge Deck ribbon tab opens.

EX. To define the bridge deck

1. (Optional) If the mouse pointer is not already displayed as the Plate Cursor, in the Analytical Modeling workflow on the Geometry ribbon tab, select the Plates Cursor tool in the Selection group.

2. Press <CTRL+A>.
   All plate elements are selected in the entire model.
3. In the Bridge Deck workflow on the Bridge Deck ribbon tab, select the Create Deck tool in the Deck group.

   The Save Deck as dialog opens.
4. Type Northbound for the Name.
5. Click OK.

EX. To generate the influence surface for the deck

1. On the Bridge Deck ribbon tab, select the Loading > Influence Surface Generator tool in the Loading group.
A temporary STAAD input file (filename_deck.std) is sent to the STAAD analysis engine for processing. The STAAD Analysis and Design dialog opens to display the progress. When the analysis is complete, the dialog closes automatically.

2. On the Bridge Deck ribbon tab, select the Loading > Influence Diagram tool in the Loading group. The Influence tab (on page 2961) opens.
3. Select the Diagram Type as Node Displacement. The Parameter field updates to display Node Displacement and the object field updates to Node.
4. Select the Node Displacement as Y (Global Y direction).
5. Select the Node as 104 (approximately center of the deck, mid-span of the longer span).
6. Click OK.
   The influence surface for the vertical displacement at node 104 is drawn on the deck.

EX. To define the roadway lanes

Note: The deck is selected in the Bridge Deck ribbon tab Deck group by default, since only one deck has been defined. Otherwise, it would be necessary to select the correct deck on which a new roadway is to be defined.

1. On the Bridge Deck ribbon tab, select the Define Roadway tool in the Deck group.

   The Roadways dialog (on page 2948) opens.
2. Click New.
   The Define Roadway dialog (on page 2950) opens.
3. Type 0.61 m for Curb A: Origin Z value and 6.35 m for Curb B: Origin Z value. Leave all other values as the default.
   The preview updates to display the roadway on the currently selected deck.
4. Click OK.
   Roadway CW 1 is now added to the Roadways list in the Roadways dialog and is outlined in blue on the deck in the active view window.
5. Click Close.

EX. To place automatically generated loads on the roadway

1. On the Bridge Deck ribbon tab, select the Loading > Run Load Generator tool in the Loading group.
   The Load Generator Parameters dialog (on page 2955) opens.
2. On the General tab, Select BS5400 Part 2 as the Design Code.
   The code tab updates to BS5400.
4. Select the BS 5400 Specific Parameters (on page 2957).
   Note: For this example, the default single load case with the nominal HB vehicle and unit of 30 are OK.
5. Select the Node Displacements tab.
**Application Examples**

**EX. Bridge Deck Loading Example**

**Note:** An action must be defined for which the maximum results determine the placement of the moving loads. This example will use the same action as reviewed above in the influence surface.

6. Enter the following data into the Node Displacements table:

<table>
<thead>
<tr>
<th>Node</th>
<th>Displacement</th>
<th>Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>104</td>
<td>Y</td>
<td>+ve</td>
</tr>
<tr>
<td>104</td>
<td>Y</td>
<td>-ve</td>
</tr>
</tbody>
</table>

7. Click **OK**.
The program analyzes the deck to obtain the critical load positions for the specified action.

A summary of the analysis is opened in your default text editor (e.g., Notepad). The file (named `filename_deckx.out`) is saved in the same location as the input file. Close the text editor once you have completed reviewing this file.

**EX. To review the generated loads graphically**

1. Select **2:N04: Disp Y -ve** in the current load case drop-down list, found in the View toolbar.
2. Either:
   - Select **View > Structure Diagrams...**
   - or
   - Right-click anywhere in the active view window and then select **Structure Diagrams...** from the pop-up menu.
   - The **Diagrams** dialog opens.
3. Select the **Deck tab** (on page 2962).
4. Select to display **Loads** and **Vehicles** in addition to Roadways (on by default).
5. Click **OK**.

The placement of the loads and vehicles are overlayed on the bridge deck. Note that the defined roadway was wide enough for two lanes of traffic, and these were created automatically.

**EX. To transfer the load case to the STAAD.Pro model**

To transfer the generated load cases to STAAD.Pro for analysis and design, do the following.

1. On the **Bridge Deck** ribbon tab, select the **Loading > Create Loading in STAAD Model** tool in the **Loading** group.
   - A message dialog opens to confirm the load was successfully added in the STAAD input file.
2. Select the **Analytical Modeling** workflow.
3. On the **Loading** page, review the loads added to the input file in the **Load & Definitions** dialog.
   - **Note:** One load was added for each action requested in the **Load Generators Parameters** dialog.
4. (Optional) Select the **Design | Steel** page and define parameters for the BS5400 code to perform a member design in addition to analysis for the generated loads.
5. On the **Analysis and Design** ribbon tab, select the **Run Analysis** tool in the **Analysis** group.
EX. Bridge Deck Loading Input File

The following input is used for this example:

<table>
<thead>
<tr>
<th>MEMBER INCIDENCES</th>
</tr>
</thead>
<tbody>
<tr>
<td>986 1 0 7; 989 41 43; 990 43 45; 991 45 47; 992 47 49; 993 49 51; 994 51 53;</td>
</tr>
</tbody>
</table>
Application Examples

EX. Bride Deck Loading Example

Application Examples

EX. Bride Deck Loading Example

STAAD.Pro User Manual
EX. Pushover Analysis Example

This single moment frame analyzed using a Pushover Analysis.
EX. To create model used for pushover example

To quickly set up the model used for this example, use the following procedure.
**Application Examples**

**EX. Pushover Analysis Example**

Only one pushover definition can be added to a model. Therefore, this example will start with a model you can add the pushover definition to. The end result will be functionally equivalent to the example model installed with the program.

1. Start an empty STAAD.Pro model in the analytical modeling workflow.
   - Refer to [GS. To create a new STAAD.Pro model](on page 35) for additional details.
2. On the **Utilities** ribbon tab, select the **Command File** tool in the **Edit** group.

   ![Command File Icon]

The STAAD.Pro Editor window opens.

3. Click **Copy to Clipboard** below.

   ```plaintext

   ```

4. In the STAAD.Pro Editor window, select the **Paste** tool on the **Home** ribbon tab.
The model contents are pasted into the editor.

5. Save and close the STAAD.Pro Editor.

The model opens in the Analytical Workflow.

**EX. To define general pushover data**

1. On the **Loading** ribbon tab, select the **Pushover** tool in the **Define Loading Systems** group. The **Create New Definitions / Load Cases / Load Items** dialog opens with only the Pushover tab displayed.
2. On the Define Input tab, select the **General Input Parameters** option.
3. Select **Moment Frame** as the **Type of Frame**.
4. Select **Ignore Effect** from the **Geometric Non-Linearity Effect** drop-down list.
5. Set the **Displacement Incremental Value** option and then type 0.010 (in) in the text field.
6. Click **Add**.
7. Select the **Member Specific Parameter** option.
8. Set the **Expected Yield Stress** option and then type 36.0 (kip/in²) in the text field.

   **Note:** You will assign this parameter to members in a later procedure.

9. Click **Add**.

In the next procedure, you will define the loading pattern and spectrum data, so you can leave the Define Pushover dialog open.

**EX. To define loading pattern and spectrum data**

1. On the **Define Pushover** dialog, select the **Define Loading Pattern** tab.
2. Type 250 in the **Number of Push Load Steps**.
3. Click **Add**.
4. Select the **Define Spectrum Data** tab.
5. Type 5.0 (%) in the **1st Spectrum** text field.
6. Delete the values from the remaining spectrum fields.
7. Select **Class A** from the **Site Category** drop-down list.
8. Type 1.0 in both the **At Short Period** and **At One - Second Period** text fields.
9. Click **Add**.

In the next procedure, you will define the solution control, so you can leave the Define Pushover dialog open.

**EX. To define the solution control**

1. On the **Define Pushover** dialog, select the **Define Solution Control** tab.
2. Select the **Push Upto Defined Displacement at Control Joint** option.
3. Select **X Axis** for the **Direction**.
4. Type 5.00 (in) in the **Joint Displacement Value** text field.
5. Select 10 as the Joint Number.
   The drop-down list contains the node numbers within the entire model.
6. Click Add.
7. Click Close.

EX. To assign the member-specific parameters

1. On the Load & Definition dialog, expand the Definitions > Pushover Definitions section.
   You will see the input parameters for the pushover definition you have added.
2. Select the entry labeled FYE 36.00000.
3. In the Assignment Method group, select Assign To View.
4. Click Assign.
   You are prompted to confirm you want to assign to all visible members in the view.
5. Click Yes.

EX. To specify and run the pushover analysis

1. Either:
   select the Analysis page
   or
   on the Analysis and Design ribbon tab, select the Analysis Commands tool in the Analysis Data group

   The Analysis/Print Commands dialog opens.
2. Select the Perform Pushover Analysis tab.
3. Click Add.
4. Click Close.
5. On the Analysis and Design ribbon tab, select the Run Analysis tool in the Analysis group.

   The STAAD Analysis and Design dialog opens.
6. Select the Go to Post Processing Mode option.
7. Click Done.

   The Postprocessing Workflow opens.

EX. To review pushover displacement results

If you did not select the Postprocessing option in the results dialog in the previous procedure, select the Postprocessing workflow.
**Application Examples**

EX. Pushover Analysis Example

1. On the **Results** ribbon tab, select the **Layouts** tool drop-down in the **Dynamics** group.

2. Select the **Graphs** tool in the **Pushover** group.
   The Capacity Curve graph and Capacity Curve table open.

   **Note:** The last load step (63) has a displacement that exceeds the maximum of 5.0 in specified in the pushover parameters.

3. On the **Results** ribbon tab, select the **Layouts** tool drop-down in the **Dynamics** group.

4. Select the **Node Results** tool in the **Pushover** group.
   The Node Displacements and Support Reactions tables open.

   **Note:** These tables display the values for the entire structure for a selected load step. The deflected shape for the current load step is also displayed graphically.

5. Type 63 in the **Select Load Step** field and then press `<Enter>`.  
The tables and view window update.

6. On the **Results** ribbon tab, select the **Layouts** tool drop-down in the **Dynamics** group.

7. Select the **Beam Results** tool in the **Pushover** group.  
The Beam Hinge Results and Beam Force Detail tables open.

8. Repeat clicking the up arrow adjacent to either **Select Load Step** field until load step 4 is displayed.

   **Note:** The first hinge initially forms at this step. This is denoted with a green hinge, representing immediate occupancy status.

9. Repeat clicking the up arrow until about load step 44 is reached.  
Several more hinges have formed at the top of the elastic range and the first hinge has now turned blue, representing the Life Safety range of the acceptance criteria.
OpenSTAAD

Application programming interface for STAAD.Pro.

OS. Fundamentals of OpenSTAAD

What is OpenSTAAD?

OpenSTAAD is a library of exposed functions allowing engineers access to STAAD.Pro's internal functions and routines as well as its graphical commands. OpenSTAAD allows engineers and other users to link in-house or third-party applications with STAAD.Pro.

Where can I use OpenSTAAD?

OpenSTAAD can be used to write macros or scripts within third-party applications, such as Microsoft® Office Excel® or Autodesk AutoCAD® using visual basic for applications. You can also write custom user tools (also called macros) to run from within STAAD.Pro using the STAAD.Pro Script Editor. Lastly, you can write custom scripts or even applications in other programming languages, such as Visual Basic, C#, Python, C++, VB.net and more.

Note: OpenSTAAD does not support .NET Core applications.

OpenSTAAD Requires STAAD.Pro

OpenSTAAD is an API for STAAD.Pro and you must have STAAD.Pro installed on the machine running OpenSTAAD in order to use it. Essentially, OpenSTAAD allows your spreadsheet or custom program to access the power of STAAD and work with STAAD models, but it requires STAAD.Pro in order to do so.

Note: Bentley Systems, Inc. also licenses OpenSTAAD to power standalone applications as “OpenSTAAD OEM”. Please contact Bentley Systems for additional details.

OS. Application Program Interface (API)

The OpenSTAAD library of functions is classified under the following general categories:

- STAAD File Input and Output (I/O)
- Structure Geometry
- Member Specifications
- Properties
OS. Instantiating the OpenSTAAD Library for Use

The first thing necessary to access STAAD project data from within another application is to instantiate, or create an instance of OpenSTAAD within the other application. In Visual Basic for Applications (VBA), this may be done by creating an object variable and then assigning to it the OpenSTAAD object. The VBA `GetObject` function may be used for this.

The object which controls the STAAD.Pro environment is referred to as `StaadPro.OpenSTAAD`. This object must be created in order to get access to any of the internal graphical functions within STAAD.Pro (including the creating of menu items and dialog boxes) as well as access to STAAD’s viewing, geometry modeling, results grid, and post-processing functions. The following VBA function can be used to instantiate or create this object:

```vba
Set MyObject = GetObject("filepath", "objectclass")
```

Where:

- **MyObject** the Object name declared in a previous `Dim` statement.
- **filepath** the optional string providing the full file path and name of the file containing objects to retrieve. In the case of OpenSTAAD, this can be omitted, along with the trailing comma.
- **objectclass** the string representing the class of the object. In the case of OpenSTAAD, this is always `Staadpro.OpenSTAAD`.

Thus:

```vba
Set objName = GetObject("StaadPro.OpenSTAAD")
```

At the conclusion of your OpenSTAAD application, the OpenSTAAD object(s) should be terminated, to unlock the handles within the application to the OpenSTAAD functions, and to free system resources.

---

**Example**

```vba
Sub How2Begin()
    'Create a variable to hold your OpenSTAAD object(s).
    Dim objOpenSTAAD As Object
    'Launch OpenSTAAD Object
    Set objOpenSTAAD = GetObject("StaadPro.OpenSTAAD")

    'At the end of your application, remember to terminate the OpenSTAAD objects.
End Sub
```
OS. Function Return Value

Most OpenSTAAD functions return a value to either:

- indicate the success or failure of the function (a Boolean result), or
- results value of the function (a numeric value result).

**Note:** Functions that return values are indicated with a “variant” return some sort of value. Refer to the reference for each function to see the possible values. Functions indicated with a “void” do not return anything.

If a function returns a Boolean result and that return value for an OpenSTAAD function is equal to 0 (zero), it means that OpenSTAAD was unable to execute the function. If you see this result, check that you have passed all the required parameters to the function. Make sure that all parameters being passed are valid. A return value of 1 (one) indicates that OpenSTAAD successfully executed the function.

Unless specified otherwise, results returned by a function are stored in variable names passed to it for the purpose.

A few of the OpenSTAAD Application functions return the results as the return value of the function. In those cases, the above comments regarding the function return value do not apply.

If a function returns the value of the function,

```
Dim returnValue
returnValue = objOpenSTAAD.BooleanReturn (param1, param2, … ,paramn)
```

**VB Example**

```
objOpenSTAAD.BooleanReturn param1, param2, … ,paramn

'or, if you would like to capture the Boolean result for flagging:
functionFlag = objOpenSTAAD.BooleanReturn param1, param2, … ,paramn
```

OS. STAAD Nomenclature

In STAAD documentation and in the program menus and dialog boxes, the terms “member” and “beam” are used interchangeably. Use of the term “beam” should not be taken to imply that the member cannot take an axial load.

Similarly, the terms “joint” and “node” are used interchangeably in STAAD. Both terms refer to the connections between elements.

Connections are also referred to as incidences. The terms “member incidences,” “plate incidences,” and “solid incidences” refer to the nodes that connect these elements to other elements and supports.
OS. OpenSTAAD API Documentation

Programmer reference documentation for the OpenSTAAD API is installed separately at C:\Program Files\Bentley\Engineering\STAAD.Pro CONNECT Edition\Help\OSAPP\index.html (typical location).

1. Select the File ribbon tab.
   The backstage view opens.
2. Select Help > OpenSTAAD Help.
   The OpenSTAAD Documentation opens in your default web browser.

OS. Using OpenSTAAD in Other Applications: VBA

Using Visual Basic for Applications (VBA), you can write macros within other software which also support VBA to utilize STAAD.Pro functionality in that application. You write the necessary code using VBA tools within that application.

With OpenSTAAD, you can use VBA macros to perform such tasks as automating repetitive modeling or post-processing tasks or embedding customized design routines. Following an open architecture paradigm, OpenSTAAD was built using ATL, COM, and COM+ standards as specified by Microsoft. This allows OpenSTAAD to be used in a macro application such as MicroStation, Microsoft Office Excel, or Autodesk AutoCAD.

For example, you could write a spreadsheet capable of sending model geometry to a STAAD file. You could similarly write a macro in a CAD program that will retrieve design results like member sizes to display in a CAD file.

OpenSTAAD is compatible with any version of Microsoft® Office Excel® that supports VBA macros.

OS. To create an Excel workbook macro

If you have not previously created any macros in Microsoft Office Excel, use this procedure to access the developer tools and set up a VBA module.

1. Open an empty spreadsheet in Microsoft Office Excel.
2. Turn on the Developer ribbon tab:
   a. Select Options from the File ribbon tab.
      The Excel Options dialog opens.
   b. Select the Customize Ribbon tab in the dialog.
   c. Check the Developer option in the Main Tabs list.
   d. Click OK.

For additional details, refer to https://support.office.com/en-us/article/show-the-developer-tab-e1192344-5e56-4d45-931b-e5fd9bea2d45.

   The Microsoft Visual Basic for Applications window opens. This is the development environment in which you will write your VBA code to have Excel interact with STAAD.Pro via OpenSTAAD.
4. Select Insert > Module.
   A new folder (named Modules) and an empty Module is added to the VBA Project.

5. Create a subroutine which will contain your code:
   a. In the Module1(Code) window, type Sub OS_Tutorial()
   b. Press <Return>.
      The coding tool automatically adds the End Sub code for you.

6. Press <Tab> to indent your code.
   Tip: Though not necessary to make your code function well, indenting and aligning code can make it much easier to read by people. It is a good practice to indent the code within a subroutine, and indent additionally within if statements or other children of the subroutine.

7. Type Sheet1.[A1].Value = "Hello World".
   This assigns the text string as the value of the cell A1 on worksheet Sheet1. This is a shorthand method in Excel VBA, where as you can also use Sheet1.Cells(1, 1).Value. You can find details on Excel VBA here: https://docs.microsoft.com/en-us/office/vba/api/excel.worksheet.cells

8. Run your macro:
   select Run > Run Sub/User Form
   or
   select the Run Sub/User Form tool
   or
   press <F5>
   Your spreadsheet (in the Excel program window) now says "Hello World" in cell A1.

   Note: You will have to save this Excel Spreadsheet as a “Excel Macro-Enabled Workbook (*.xslm)” format to maintain the VBA macro you just wrote.

While having your computer return "Hello World!" may be a classic example of a first program, it is not a very practical tool. However, you now have a file set up to create a more useful OpenSTAAD project in your next example.

OS. Connect a VBA Editor to STAAD

To connect your Visual Basic for Applications Editor to STAAD in order to use autocomplete, do the following.

This procedure is optional, but highly recommended in order to have your editing environment be able to assist you in writing code.

Tip: The procedure below is show for Microsoft® Office Excel®, but is similar to how to perform this for most any VBA compatible application.

1. Start Microsoft Office Excel as an administrator.
   Performing the following steps as an administrator allows your to make a change to the template. This prevents you from having to re-perform this task every time you edit your VBA macro.
   a. From either the Windows Start menu or Windows Explorer, right-click on the Excel application.
b. Select **Run as administrator** from the pop-up menu.

You are asked if you want to allow the application to make changes to your computer. Confirm you will allow this.

2. In Excel, select the **Visual Basic** tool in the **Code** group on the **Developer** ribbon tab.
   The **Microsoft Visual Basic for Applications** window opens.

3. Select **Tools > References**.
   The **Reference - VBA Project** dialog opens.

4. Click **Browse**.
   The **Add Reference** dialog opens.

5. Navigate to and select `C:\Program Files\Bentley\Engineering\STAAD.Pro CONNECT Edition\STAAD\StaadPro.dll` and then click **Open**.

6. Scroll through the list of **Available References** to locate **OpenSTAADUI (1.0)** and check this option.

7. Click **OK**.

Now, you can set objects to the OpenSTAAD classes using this reference.
You can also now view the OpenSTAADUI object contents (classes and functions) in the Object Browser, by selecting the Object Browser tool (��) in the VBA Editor.

OS. Write an OpenSTAAD Macro in Excel

This example will introduce you to several concepts necessary to writing OpenSTAAD macros in VBA.

Note: If you followed the previous “Hello World!” example, you may simply delete that line and start from that point.
OS. Instantiate OpenSTAAD in VBA

In the this set of steps, you will instantiate OpenSTAAD and have the spreadsheet macro retrieve information from the open STAAD.Pro model.

This is required in order to access OpenSTAAD API from within your code. It's a two part process in VBA: You first declare something as the object and then direct the that object at OpenSTAAD.

1. Within your subroutine, type `Dim objOpenSTAAD As Object`.

Notice how as you begin typing the word “Object”, a small list opens with relevant terms. This is called IntelliSense and it can help you quickly and accurately complete code lines.

**Note:** As Visual Basic requires that objects be declared and assigned a type, it is a good practice to prefix the name with what type is used. Here, the prefix “obj” is used to describe an object. Later you’ll use different prefixes to describe variable types.

2. Press <Return>.
3. Type `Set objOpenSTAAD = GetObject(,”StaadPro.OpenSTAAD”)` and then press <Return>.

This assigns the OpenSTAAD application object to the variable you defined in Step 1.

**Note:** This approach connects to the first instance of STAAD.Pro that was started where multiple instances exist. You can alternately specify a specific file path and name to connect to the instance of the application with that file open.

4. Press <Return>.

OS. Use geometry functions in spreadsheet

In order to successfully run an OpenSTAAD macro, you must first open a model within STAAD.Pro.

This example continues by using a function in OpenSTAAD to access model data.

1. Type `Sheet1.[A1].Value = "Nodes:"` and then press <Return>.

   Much like the “Hello World” example, this simply populates a cell with a text string. Here, it’s useful to provide a label for your data.

   Here, you are assigning the value of a cell to the returned value of the GetNodeCount function, which is in the Geometry class within the OpenSTAAD object.

   This approach accesses the GetNodeCount function directly within the objOpenSTAAD object.

3. Type `Dim objGeometry As OSGeometryUI` and then press <Return>.

   If you OS. Connect a VBA Editor to STAAD (on page 6949), then you will notice that the editor will begin auto-completion when you start typing OSGeometryUI. You can press <Tab> to accept the highlighted result in the auto-completion pop-up list and move to the end of that entry.
4. Type `Set geometry = objOpensTAAD.geometry` and then press `<Return>`. This will assign the object geometry to the geometry class within the OpenSTAAD object.

5. Type `Sheet1.[A2].Value = "Members:"` and then press `<Return>.

6. Type `Sheet1.[B2].Value = geometry.GetMemberCount` and then press `<Return>.

   Here, you will notice that the auto-completion menu opens again once you type `geometry`. to show you all of the functions and methods within the geometry class in OpenSTAAD. This is the benefit of first setting the object to that class.

   ```vba
   Dim geometry As OSGeometryUI
   Set geometry = objOpenSTAAD.geometry
   Sheet1.[A2].Value = "Members:" Sheet1.[B2].Value = geometry.GetMemberCount
   ```

7. Run your macro.

The spreadsheet populates with the number of nodes and members in the currently open STAAD.Pro model.

The spreadsheet will now populate with the number of nodes and members in the currently open STAAD.Pro model.

You complete code should look like this:

```vba
Sub OpenSTAADTutorial()
    Dim objOpenSTAAD As Object
    Dim stdFile As String
    Set objOpenSTAAD = GetObject(, "StaadPro.OpenSTAAD")
    Sheet1.[A1].Value = "Nodes:
    Sheet1.[B1].Value = objOpenSTAAD.geometry.GetNodeCount
    Sheet1.[A2].Value = "Members:" Sheet1.[B2].Value = geometry.GetMemberCount
End Sub
```
Next, you will create a simple UI element in your spreadsheet to access the macro.

OS. Run Your Macro from within the Spreadsheet

To add a button or other interactive tools in your spreadsheet to activate your macro, use the following procedure.

It wouldn't be convenient to need to open the VBA window every time you want to run the macro. In order to make a more user-friendly spreadsheet, you can add controls in the spreadsheet to access macro functionality.

1. In your spreadsheet, select the **Insert > Button (Form Control)** tool in the **Controls** group on the **Developer** ribbon tab.

   ![Insert > Button (Form Control)](image)

   The mouse pointer changes to a crosshair.

2. Click-and-drag a rectangle anywhere in your spreadsheet.

   This will form the size and shape of the button, so something slightly less than 2x2 spreadsheet cells is useful.

   The **Assign Macro** dialog opens.

3. Select the name of your subroutine from the **Macro** name list and then click **OK**.

   This assigns the button click action to run this subroutine.

4. Click the new button (labeled Button 1) in your spreadsheet.

   The macro runs and the spreadsheet is populated with the node and member counts.

   **Note:** If you had previously run the macro from within the VBA Editor window, then it may appear as though nothing has happened. Select and clear the cell contents and click the button again to see it in action.

5. Right-click on the button and select **Edit Text** to change the button label to something descriptive.

   Click anywhere outside of the button to exit the text editing state.
OS. Interpreting OpenSTAAD API Syntax for VBA

The functions documented for the OpenSTAAD are given in the C++ syntax. It's typically a simple process to interpret these for use in a VBA macro.

Classes and Method

In the C++ syntax used in the documentation, class syntax is listed in the format OSClassUI::Method. In VBA, this should be instead given as Class.Method.

In the example, OpenSTAAD was instantiated using the object "objOpenSTAAD". Classes were then called using the format objOpenSTAAD.Class (for example, the Geometry class was referenced using objOpenSTAAD.Geometry).

The exception of course is the "root" OpenSTAAD functions, which will use whatever variable you have used to instantiate OpenSTAAD (for example, objOpenSTAAD.GetBaseUnit). That is, the OpenSTAAD object acts as the class for these functions.

Return Values

The syntax listed indicates if a function has a return value with a leading VARIANT. This simply means that function will return a value that typically will be stored into a variable. If the function syntax is listed with a leading void, then there is no return value.

Note: A return value of a function is not to be confused with values stored in function parameters!

Variables and Parameters

The syntax listed typically indicates parameters as type VARIANT FAR, which is not necessarily useful.

Instead, it is important that you read the parameter descriptions which will indicate what type of variable to use (i.e., string, long). This will indicate what type of variable to declare in VBA before you use it.

OS. Examples

The following examples have been provided to assist in creating macros using OpenSTAAD in commonly used applications like Microsoft Excel, Autodesk AutoCAD, Microsoft Word.

OS. Microsoft Excel Macro Example

A Microsoft Office Excel spreadsheet which can be used to check the capacity of a rectangular, reinforced concrete beam.

This spreadsheet file checks the bending capacity of a rectangular concrete beam with the reinforcement already laid out. The capacity is checked against the maximum sagging moment produced from a series of load cases. The beam is analyzed in STAAD.Pro. The results are extracted and linked into Excel using OpenSTAAD and VBA.

1. In STAAD.Pro, select the Sample Models link on the Open tab of the Start page.
3. Select the Run Analysis tool in the Analysis group on the Analysis and Design ribbon tab.

   The macro relies on having analysis results.
4. Open the C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\OpenSTAAD \Rectangle-Beam.xls file in Microsoft Office Excel.  

**Note:** Excel will warn of macros present in the file. Simply click the Options... button in the Security Warning message area to open the [Microsoft Office Security Options](#) dialog, where you will select the Enable this Content option and click OK.

5. Select the STAAD.Pro Output worksheet. 

The calculations for checking the capacity are located on the sheet marked “Concrete” while the extraction of the values from STAAD occurs on the sheet marked “STAAD.Pro Output.” 

6. Type a member number in cell B7.  
   Member 14 is entered by default. 

7. Click Results.  

The STAAD.Pro results are read into the spreadsheet along with the beam size. Then the Concrete worksheet is selected for you. 

The rest of the Concrete worksheet performs concrete beam design for the selected member based on the moment and dimensions. 

**Related Links** 
- [EX. OpenSTAAD Example Files](#) (on page 6197)

**Excel Macro Code**

To see what the OpenSTAAD macro is doing, use the developer tools to open the Visual Basic Editor. A macro named OpenSTAADExample has been created to retrieve the maximum sagging moment along the span of the beam as well as the width and depth of the cross-section of the beam. The maximum sagging moment for each load case is extracted, and the governing moment is the largest compression moment of the maximum moments. A second macro named Clear is provided which clears the results from the spreadsheet cells.

```
OpenSTAADExample
Sub OpenSTAADExample()  
    Dim objOpenSTAAD As Object  
    Dim stdFile As String  
    Dim BaseUnit As Integer  
    Dim strLength As String, strForce As String  
    Dim PrimaryLCs As Integer, LoadCombs As Integer, totalLoads As Integer  
    Dim EndForceArray(6) As Double  
    Dim lEnd As Long  
    Dim MemberNo As Long  
    Dim Length As Double, Depth As Double, Width As Double  
    Dim DMin As Double, dMinPos As Double, DMax As Double, dMaxPos As Double  
    Dim Ax As Double, Ay As Double, Az As Double, Ix As Double, Iy As Double, Iz As Double  
    Dim i As Integer, j As Integer  
    'Launch OpenSTAAD Object
```
Set objOpenSTAAD = GetObject(, "StaadPro.OpenSTAAD")

'Load your STAAD file - make sure you have successfully run the file
objOpenSTAAD.GetSTAADFile stdFile, "TRUE"
If stdFile = "" Then
    MsgBox "This macro can only be run with a valid STAAD file loaded.", vbOKOnly
    Set objOpenSTAAD = Nothing
    Exit Sub
End If

Cells(2, 2).Value = stdFile

MemberNo = Cells(7, 2).Value

'Check the member exists
Length = objOpenSTAAD.Geometry.GetBeamLength(MemberNo)
If Length = 0 Then
    MsgBox "Please check the member number is valid.", vbOKOnly

        Cells(j + 13, i + 2).Value = EndForceArray(j)
        Next

    'Get forces at end of member
    lEnd = 1
    objOpenSTAAD.Output.GetMemberEndForces MemberNo, lEnd, lstLoadNum(i), EndForceArray
    For j = 0 To 5
        'Print the result values in specified cells
        Cells(j + 20, i + 2).Value = EndForceArray(j)
        Next

    'objOpenSTAAD.GetMinBendingMoment MemberNo, "MZ", LoadNext, MaxSaggingMoment
    objOpenSTAAD.Output.GetMinMaxBendingMoment MemberNo, "MZ", lstLoadNum(i), DMax, dMaxPos, DMin, dMinPos
    Cells(27, i + 2).Value = DMin
    Next

'Write the appropriate dimensions (for the beam) in the correct cells
Sheets("Concrete").Select

'Get Depth and Width of Concrete Beam
objOpenSTAAD.Property.GetBeamProperty MemberNo, Width, Depth, Ax, Ay, Az,
OS. Microsoft Word Macro Example

A Microsoft Office Word document is included which contains a partial report for analysis results which can be used as a basis for a customized report document.

The document file includes a macro named `Pro` which checks for the number of supported nodes as well as the number of load cases and load combinations and reports these back to the document. The document can then report support reactions for the selected node number and load case number.

1. Open an input file within STAAD.Pro.
2. Open the file

   C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\OpenSTAAD \STAADandWord.doc

   **Note**: Word will warn of macros present in the file. Simply click the Options... button in the Security Warning message area to open the Microsoft Office Security Options dialog, where you will select the Enable this Content option and click OK.

3. Click the **Update Nodes and Load Cases** button.

   The **Node Number** and **Load Case Number** selectors update with the data from the selected file.
4. Select the **Node Number** and **Load Case Number** numbers for which results will be retrieved.

5. Click **Get Results**.

The support reactions and units update in the table below.

OS. Additional References

Documentation for VBA is beyond the scope of this manual and Bentley does not provide direct support on how to write VBA macros. There are, however, several useful and free sites on the Web to assist a beginner on writing macros in STAAD, Excel, AutoCAD, or any other VBA compliant software.

**Note:** You can get help on Visual Basic and using VBA by selecting the Help menu in the VBA Editor.

It should be noted that the VBA language is the same from software to software. However, the functions, objects, and core libraries will obviously vary.

The sites recommended by Bentley are as follows:

- [https://stackoverflow.com](https://stackoverflow.com)
- [https://www.oreilly.com/](https://www.oreilly.com/)
- [http://www.wrox.com](http://www.wrox.com)

Also, it is worth noting that many programs such as MicroStation and Microsoft Office Excel have a useful *Record Macro* feature. You can run the recorder and then select any commands from the program’s ribbon tabs. The corresponding VBA syntax will automatically be generated.

For additional information on using macros and VBA in Excel or other Microsoft Office programs, Microsoft’s MSDN is a recommended starting point:

OS. Writing OpenSTAAD in the STAAD.Pro Script Editor

A visual basic editor is embedded within the STAAD.Pro environment. Here, you can create macros that are run from within the STAAD.Pro application to interact with the current STAAD model.

There are several examples of STAAD user tools that ship with STAAD.Pro, along with the tutorial at the end of this section.

**Note:** The version of VBA which the editor supports is not 100% Microsoft VBA compatible. There are a few functions which can be supported in the Microsoft version of VBA which are not supported in the VBA editor/compiler which comes with STAAD.Pro. Every attempt is being made to support these functions.

OS. Using Macros in STAAD.Pro

This section describes how to use the STAAD.Pro Script Editor to create a new macro or load existing macros in STAAD.Pro. It also describes how to run the macros you have created in the STAAD.Pro Script Editor by adding a simple menu item.
OS. To start a new macro project

To create a new macro project and open it in the STAAD.Pro Script Editor, use the following procedure.

1. On the Utilities ribbon tab, select the Macro tool in the Developer group.

   The Macro dialog opens.

2. Click Create New.

   The New Macro File Name dialog opens.

3. Type a File name and optional Description of Macro.

   For this tutorial, type Frame in the File name field and then type Create a 2D frame with supports in the Description of Macro field.

4. Click New.

   The STAAD.Pro Script Editor window opens. An empty script is loaded with for your file.

OS. To import an existing macro

1. On the Utilities ribbon tab, select the Macro tool in the Developer group.

   The Macro dialog opens.

2. Click Import.

   The Add an Existing Macro dialog opens. The controls in this dialog are analogous to those in the Select New Macro File Name dialog, though some are inactive.

3. Navigate to and select the existing macro file.

4. Click Open.

   The macro name is added to the list of names in the Macro dialog.

   Related Links
   • EX. OpenSTAAD Example Files (on page 6197)

OS. To run a linked macro

1. On the Utilities ribbon tab, select the User Tools tool in the User Tools group.

   A drop-down menu displays all of the linked macros.

2. Select the macro you want to run from this list.
OS. To connect the STAAD.Pro Script Editor to STAAD Object Library

The STAAD object library, which contains OpenSTAAD, can be referenced in the STAAD.Pro Script Editor such that the editor will auto-complete class and function names.

This procedure is optional, but highly recommended in order to have your editing environment be able to assist you in writing code.

1. Start the STAAD.Pro Script Editor as an administrator.
   
   Performing the following steps as an administrator allows your to make a change to the template. This prevents you from having to re-perform this task every time you edit STAAD macros.
   
   a. In Windows Explorer, locate the file
      C:\Program Files\Bentley\Engineering\STAAD.Pro CONNECT Edition\STAAD\Bentley.Staad.ScriptEditor.exe.
   
   b. Right-click on the file and then select Run as administrator from the pop-up menu.

   You are asked if you want to allow the application to make changes to your computer. Confirm you will allow this.

   The editor opens with a new macro template open.

2. Select the Add Reference tool in the Design group on the Home ribbon tab.

   The References dialog opens.

3. Click Browse.

   The References dialog opens.

   Available References:
   - OLE Automation
   - OLE Automation
   - OLE DB Errors Type Library
   - oleprn 1.0 Type Library
   - OpenSTAADUI (1.0)
   - Optimal Sound EE GFX Library
   - Optimal Sound EE LFX Library
   - Optsholc 1.0 Type Library
   - OsEditionUpgradeProvider 1.0 Type Library
   - Page 1.0 Type Library
   - PCEE4 API TypeLib (1.0)
   - PCEE4 Control Panel Extension Analog Library
   - PCEE4 Colby DLL (ANALOG) (1.0)
   - PDFFilter 1.0 Type Library
   - PDFMAcad 1.0 Type Library

   Location: C:\Program Files\Bentley\Engineering\STAAD.Pro CONNECT Edition\STAAD\OpenStaadui.dll
   Language: Standard
   Name: OpenSTAADUI
4. Navigate to and select `C:\Program Files\Bentley\Engineering\STAAD.Pro CONNECT Edition\STAAD\StaadPro.dll` and then click **Open**.
5. Scroll through the list of **Available References** to locate **OpenSTAADUI (1.0)** and check this option.
6. Click **OK**.

Now, when the **Browse Object** tool (throat) is selected, you will see OpenSTAAD functions included in the Library list.

•  *OS. User Type Not Defined* (on page 7033)

**OS. Simple STAAD.Pro Macro**

This example demonstrates a small macro which can be used within STAAD.Pro.

Often, when learning to program, you begin with a program which simply outlines the basic structure of an application, module, or function; typically resulting with a screen message displaying the phrase "Hello World". This example expands upon this to include the foundation from a practical application as well.

**Note:** Additional examples in this section demonstrate how to poll STAAD data from external programs.

1. Open STAAD.Pro.
2. On the **Utilities** ribbon tab, select the **Macro** tool in the **Developer** group.

   ![Macro dialog open](image)

3. Click **Create New**.
   
   The **New Macro File Name** dialog open.
4. Type a title of CreateNewView.vbs with the following description: Creates a new view from the selected beams.

   **Note:** You can save the macro file anywhere, so long as the directory has write permission for your user account.

   The **OS. STAAD.Pro Script Editor window** (on page 6988) opens with an subroutine title Main.
5. Just after the description, type the following just after the description comment line:

```vba
Dim objOpenSTAAD As Object
Dim SelBeamsNo As Long
Dim SelBeams() As Long
```

This is used to provide some declarations of the objects and variables used in this program.

6. Type the following lines to instantiate the OpenSTAAD object:

```vba
'Launch the OpenSTAAD Object
Set objOpenSTAAD = GetObject(,"StaadPro.OpenSTAAD")
```

**Note:** The first line beginning with the apostrophe (') is a comment. It isn't necessary, but it is good practice to add remarks such as this to make your code clear to others (as well as to yourself when you revisit the code at a later time).

7. Type the following lines to set up a logical check for if any beams are selected:

```vba
'Get no. of selected beams
SelBeamsNo = objOpenSTAAD.Geometry.GetNoOfSelectedBeams
If (SelBeamsNo > 0) Then
```

Here, the `GetNoOfSelectedBeams` Geometry function in OpenSTAAD is being used to aid our test. The test is a if... then... else... statement, which continues in the following steps.

8. Type following lines to instruct the program what to do if our statement is true (i.e., there is at least one beam selected).

That is to create a new view from the active selection using the `CreateNewViewForSelection` View function in OpenSTAAD.

```vba
ReDim SelBeams(SelBeamsNo) As Long
'Create a new view
objOpenSTAAD.View.CreateNewViewForSelections
```

9. Type the following lines.

Since this macro might be run with no beams selected, a message can be provided to the user for some feedback in this instance with the following line:

```vba
Else
    MsgBox "No beams are currently selected.", vbOkOnly
End If
```

**Tip:** You could add the message Hello World, if you prefer to stick with a more traditional introductory example of programming.

10. Type the following statement to close the instance of the OpenSTAAD object:

```vba
Set objOpenSTAAD = Nothing
```

This is all it requires to create a macro. Obviously, this particular example really only duplicates the functionality of selecting the New View tool in STAAD.Pro. However, it easy to combine other OpenSTAAD functions to automate a series of commonly used features in order to create your own time saving tools.

In this example, for the sake of brevity, the only model entities checked for selection are beams (that is, a new view is only created if beam elements are selected). You could easily expand this to Nodes, Plates, Solids, etc.
Example

The full code for this macro is as follows:

```vbscript
Sub Main()
    'DESCRIPTION: Creates a new view from the selected beams.
    Dim objOpenSTAAD As Object
    Dim SelBeamsNo As Long
    Dim SelBeams() As Long
    'Launch OpenSTAAD Object
    Set objOpenSTAAD = GetObject(, "StaadPro.OpenSTAAD")
    'Get no. of selected beams
    SelBeamsNo = objOpenSTAAD.Geometry.GetNoOfSelectedBeams
    If (SelBeamsNo > 0) Then
        ReDim SelBeams(SelBeamsNo) As Long
        'Create a new view
        objOpenSTAAD.View.CreateNewViewForSelections 'SelBeams
    Else
        MsgBox "No beams are currently selected.", vbOkOnly
    End If
    Set objOpenSTAAD = Nothing
End Sub
```

OS. Macro Tutorial

This tutorial will take you step-by-step through the process of creating a practical macro used to generate a parametric 2D frame with supports.
The assumptions behind this parametric frame are:

- 2D frame lies in the XY plane at Z = 0 (with first support node at the origin)
- All bays are of equal width and height
- The user specifies the units of length before running the macro
- All supports have the same type and all nodes at Y = 0 are supports

Most of these assumptions could be either validated for altered with some changes or additions to the macro presented in this tutorial.

OS. To start a new macro project

To create a new macro project for this tutorial and to then open it in the STAAD.Pro Script Editor, use the following procedure.

The macro used in this tutorial is intended to run in an empty file. Therefore, you should start with an new STAAD input file in the Analytical Modeling workflow.

1. On the Utilities ribbon tab, select the Macro tool in the Developer group.
The Macro dialog opens.

2. Click Create New.
   The New Macro File Name dialog opens.

3. Type a File name and optional Description of Macro.
   For this tutorial, type Frame in the File name field and then type Create a 2D frame with supports in the Description of Macro field.

4. Click New.
   The STAAD.Pro Script Editor window opens. An empty script is loaded with for your file.

5. Select the line 'TODO: Add your code here (i.e., line 4) and press <Delete>.

OS. Creating the User Dialog

The form is the dialog which a user will use to specify the frame parameters. This form will used text entry fields for the frame size and then a pair of options to allow the user to select the support type.

OS. To create the dialog form

Your cursor should be located where the dialog code will be inserted. If you deleted the comment line in the previous procedure, then your cursor is in the correct location (i.e., line 4).

1. Select the User Dialog tool in the Design group.

   The UserDialog Editor opens.

2. Either:

   Click the Edit Item Properties tool

   or

   Right-click anywhere in the form layout

   The Edit User Dialog Properties dialog opens.

3. Type 600 in the Width field and then 200 in the Height field.
   These values are somewhat arbitrary, but allow for a sufficient amount of space to include the dialog controls.

4. Type 2D Frame Model in the Caption field.
5. Click **Close**.
6. Select the **Set Grid** tool.
   The **Grid Settings** dialog opens.
7. Type 5 for both the Horizontal and Vertical grid values.
8. Click **OK**.
OS. To create the text fields and labels

1. Select the **Add Text** tool. 

2. Click somewhere near the top, left corner of the form.

3. Repeat steps 2 and 3 to add four additional text labels along the left side of the dialog. This does not have to be precise. The labels and fields will be aligned by coordinates in a later step.

4. Select the **Add TextBox** tool.

5. Click a point to the right of the first label to add a data field in the form.

6. Repeat steps 4 and 5 to add three additional text boxes.
7. Edit the location and caption for the first label:
   a. Right-click on the first label.
      The **Edit Text Properties** dialog opens.
      
      ![Edit Text Properties dialog](image)

      **b.** Type the following values to define the label layout:
      
      - **Left**: 20
      - **Top**: 20
      - **Width**: 190
      - **Height**: 15 (default if you placed with a click)
      
      **c.** Type **No. of Horizontal Bays** in the **Caption** field.
      Leave the remaining fields as their defaults.
      
      **d.** Click >>

---

*OpenSTAAD*

OS. Writing OpenSTAAD in the STAAD.Pro Script Editor
The properties for the next control added are displayed. This allows you to quickly make changes to the controls without the need to close and reopen this dialog.

8. Repeat step 7 to update the layout and caption for the remaining text labels as indicated below.

<table>
<thead>
<tr>
<th>Label Name</th>
<th>Rectangle (Left, Top, Width, Height)</th>
<th>Label Text</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text2</td>
<td>20,45,190,15</td>
<td>No. of Vertical Bays:</td>
</tr>
<tr>
<td>Text3</td>
<td>20,70,190,15</td>
<td>Vertical Distance:</td>
</tr>
<tr>
<td>Text4</td>
<td>20,95,190,15</td>
<td>Horizontal Distance:</td>
</tr>
<tr>
<td>Text5</td>
<td>20,130,190,15</td>
<td>Support Type:</td>
</tr>
</tbody>
</table>

When you click >> on Text5, the Edit TextBox Properties dialog opens for the first text box control.

When you click >> on Text5, the Edit TextBox Properties dialog opens for the first text box control.

Tip: If a different set of properties are displayed, then you can continue clicking >> to cycle through the controls until the TextBox properties are displayed or close and right-click on the text box to open them.

9. Edit the location and name for the text box:
   a. Type the following values to define the text box:
      
      Left = 220  
      Top = 20  
      Width = 130  
      Height = 15  

   b. Type clmn in the Field field.
      
      This is the object name which the macro will use for this text box.

   c. Click >>.
      
      The properties for the next control added are displayed.

10. Repeat step 9 to update the layout and field name for the remaining text boxes as indicated below.

<table>
<thead>
<tr>
<th>Text Box Name</th>
<th>Rectangle (Left, Top, Width, Height)</th>
<th>Field Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>TextBox2</td>
<td>220,40,130,15</td>
<td>row</td>
</tr>
</tbody>
</table>
OS. To create support options

Since the macro in this tutorial limits the support options to only fixed or pinned, using a pair of radio buttons to allow the user to select the support type is a good design choice. However, in a situation where three or more options were available, a drop-down list control might be a better choice.

1. Select the Add OptionButton tool.
2. Click a point to the right of the Support Type label (i.e., text5). The option control is placed.
3. Repeat steps 1 and 2 to add a second option to the right of the first.
4. Right-click on the first option control. The Edit OptionButton Properties dialog opens.
5. Type the following values to define the location:
   
   Left = 220
   Top = 130
   Width = 90
   Height = 15

6. Type Fixed in the Caption field.

7. Type sprt in the OptionGroup combo box.

8. Click >. The properties for the second option control are displayed.

9. Repeat steps 5 through 7 except type 370 in the Left field and Pinned in the Caption field.

   Tip: Since the option group was previously defined, you can now selected from the drop-down list in the combo box rather than re-type its name.

OS. To add the dialog buttons

The last step in defining the dialog is to add the OK and Cancel buttons.

1. Click the Add OK Button tool. 
2. Click a point near the bottom, right corner of the form. The OK button is placed.
3. Click the Add Cancel Button tool. 
4. Click a point to the right of the OK button.

**Note:** This is the recommended button order according to Microsoft’s design guidelines.

The Cancel button is placed.

5. (Optional) Either:
   - right-click on either button to precisely edit the location
   - or
   - drag the buttons to align them to the grid

6. Select the Save and Exit tool. 
   The UserDialog Editor closes.

The dialog definition code is added to your macro:

```
Begin Dialog UserDialog 600,200,"2D Frame Model" %GRID:5,5,1,1
Text 20,20,190,15,"No. of Horizontal Bays":,.Text1
Text 20,45,190,15,"No. of Vertical Bays":,.Text2
```
Tip: Now is a good time to save the work done to this point.

OS. To dimension the variables and add initial values in the dialog

You must dimension all the values you will use in the program. Further, it's a good idea to populate the dialog with initial values for the user.

1. Select the automatically generated line of code `Dialog dlg` (i.e., line 23) and delete the line contents.
2. With your cursor after the line of code `Dim dlg as UserDialog`, type the following to dimension the variables in use:

   ```vba
   Dim dlgResult As Integer
   Dim crdx As Double
   Dim crdy As Double
   Dim crdz As Double
   Dim n1 As Long
   Dim n2 As Long
   Dim i1 As Long
   Dim s1 As Long
   ```

Note: As you being to type, the IntelliSense will provide options for the variable types. You can make use of the IntelliSense to help quickly complete lines and reduce typos in your source code.

3. Type a single quote mark followed by `Initialization`.

---

STAAD.Pro 6980 User Manual
The single quote mark is used to denote a comment. It is best practice to add clear comments to document your source code.

'Initialization

4. Type the following values to populate the dialog input fields:

    dlg.clmn = "3"
    dlg.row = "5"
    dlg.ht = "3"
    dlg.wdth = "5"

5. Type the following commands to open the dialog upon starting the macro.

    You'll also add a comment and a debugging command which is helpful for resolving any issues with your macro.

    'Popup the dialog
    dlgResult = Dialog(dlg)
    Debug.Clear

6. Type the following command to capture the result of the user action in the dialog:

    If dlgResult = -1 Then 'OK button pressed
         Debug.Print "OK button pressed"
    ElseIf dlgResult = 0 Then 'Cancel button pressed
         Debug.Print "Cancel button pressed"
    End If

Note: The single quote mark after the world Then also indicates a comment. Comments like this can follow the programming instruction on the same line.

The EndIf statement is automatically added by the editor to close the If statement if you press <Enter>.

You have now created the general set of instructions to the program what to do with the user action in the form.

You can test the macro now to see the dialog populated with the initialized values. Select the Run tool in the Execute group. The macro dialog opens. Click either OK or Cancel to close it. Neither perform any action at this point other than to log a debug message.

The next step is to have the script then perform the desired actions when the users clicks OK.

Tip: Now is a good time to save the work done to this point.

OS. To get the user values

1. Place your cursor just after the Debug.Print "OK Button pressed" line and then press <Enter> several times to create additional space between this and the following line beginning with ElseIf.

2. Type the following commands to populate the variables with the values the user types into the dialog:

    'Get the values
    clmn = Abs( CDbl(dlg.clmn) )
    row = Abs( CDbl(dlg.row) )
    ht = Abs( CDbl(dlg.ht) )
    wdth = Abs( CDbl(dlg.wdth) )
    sprt = CStr(dlg.sprt)

Note: The last captures the support array position as a string whereas the others all capture absolute value of the user input for the respective data fields.
3. Type the following debug statements to provide back the captured values:

```vbnet
Debug.Print "No. of Horizontal Bays = "; clmn
Debug.Print "No. of Vertical Bays = "; row
Debug.Print "Vertical Distance = "; ht
Debug.Print "Horizontal Distance = "; wdth
Debug.Print "Support Type = "; sprt
```

4. Type the following command to set the initial values for the coordinate variables:

```vbnet
crdx = 0
crdy = 0
crdz = 0
```

**OS. To initialize OpenSTAAD and calculate the node coordinates**

1. Type the following command to initialize OpenSTAAD:

```vbnet
Dim objOpenSTAAD As Object
Set objOpenSTAAD = GetObject(,"StaadPro.OpenSTAAD")
```

This command opens the connection to STAAD.Pro and the model currently open in the program.

**Note:** You can initialize OpenSTAAD to any variable. Here, `objOpenSTAAD` is used.

2. Type the following commands to reference the `geometry` class in a variable:

```vbnet
Dim geometry As OSGeometryUI
Set geometry = objOpenSTAAD.Geometry
```

3. Type the following two `For` loops to calculate the nodal coordinates for each node in the frame.

```vbnet
'Nodes
For j = 2 To (row + 2)
    For i = 1 To (clmn + 1)
        crdx = (i - 1) * wdth
        geometry.AddNode crdx, crdy, crdz
    Next
    crdy = (j - 1) * ht
Next
```

**Note:** There are two nested loops used because this is a 2D frame. The Z coordinate was previously set to zero and will not change.

4. Type the following commands to reference the `support` class in a variable:

```vbnet
Dim support As OSSupportUI
Set support = objOpenSTAAD.Support
```

5. Type the following `If ElseIf` statement to get the desired support type.

The support is created and the returned support reference number is stored to the variable `s1`.

A "fall back" possibility is also added in case neither of the intended support types is somehow specified, then an error message is presented to the user.

```vbnet
'Supports
If sprt = "0" Then
    s1 = support.CreateSupportFixed()
ElseIf sprt = "1" Then
    s1 = support.CreateSupportPinned()
```
Else
    MsgBox("Select Proper Support Type",vbOkOnly,"Error")
    Exit Sub
End If

**Note:** The OpenSTAAD command `support.CreateSupportFixed` can also be used to simply create a new support without using the return value. But by adding the parenthesis at the end, the script can take the returned support reference number which allows you to store that in the variable.

6. Type the following line to add a debugging statement for the returned support reference number:
   ```vbs
   Debug.Print "Support return value = ";s1
   ```

7. Type the following type to assign the support types to the bottom nodes in the frame:
   ```vbs
   For i1 = 1 To (clmn + 1)
       support.AssignSupportToNode i1,s1
   Next
   ```

**Tip:** Now is a good time to save the work done to this point.

## OS. To generate the frame members

1. Type the following commands to add the columns:
   ```vbs
   'Columns
   n1 = 1
   n2 = (n1 + clmn +1)
   For k = 1 To (clmn + 1)*row
       geometry.AddBeam n1, n2
       n1 = n1 + 1
       n2 = n2 + 1
   Next
   ```

2. Type the following commands to add the beams:
   ```vbs
   'Beams
   n1 = 1
   For k1 = 1 To row
       n1 = k1 * (clmn + 1)+1
       n2 = n1 + 1
       For k2 = 1 To clmn
           geometry.AddBeam n1, n2
           n1 = n1 + 1
           n2 = n2 + 1
       Next
   Next
   ```

3. Save your macro by either:
   - click the **File** ribbon tab and then select the **Save** tool in the backstage view
   - click the **Save** tool in the quick access toolbar
   - press `<Ctrl+S>`

Your frame macro is now complete. You are ready to test the macro to check your code.
OS. To test your macro

You can add break points through your code to assist in debugging. Practice adding one so you can read the debug print output you added.

If the program contains errors, the line where the program stops will be marked in red. Stop the program and then review your input to debug.

1. Click in the dark gray margin of the code editor just to the left of line number 57 (or the line containing cdrx = 0).
   A red dot appears to indicate this is a break point. The code will pause the execution at this point when executed.
2. Click the Run tool in the Execute group.
   
   The user dialog opens for input.
3. Change one or more values from their defaults.
4. Click OK.
   The code runs to the break point, which is now highlighted in yellow. The Immediate tab now shows the debug print statements. These should reflect any changed input you provided.

5. Click the Run tool in the Execute group again to continue to the next break point or to the end of the code.
6. Save your changes.
7. Select the File ribbon tab and then select Exit in the backstage view.
   
   Your new macro is shown in the Macro dialog list.

**Note**: Testing the macro still runs within STAAD.Pro through OpenSTAAD, so you will have a frame generated if you tested it. You will need to start with a new, empty file to run the macro correctly.
OS. To add the macro to the list of user tools

Once you have completed testing of your macro, you can add it to the list of User Tools in the STAAD.Pro application. This allows you to run it with one click.

1. On the Utilities ribbon tab, select the Configure tool in the User Tools group.

![Tools Icon]

The Customize User Defined Tools dialog opens.

2. Click New.

3. Type 2D Frame Model in the name of the command.

4. Click [...] next to the Command field.

5. Navigate to and select your Frame.vbs macro file.

6. Click Open.

7. Click OK.

Note: There are no parameters of external files used by this macro, so those fields are left empty.

OS. To run the Frame macro

1. Create a new analytical modeling input file.
2. (Optional) Change the units of length to a convenient value.
3. On the Utilities ribbon tab, select the User Tools > 2D Frame Model tool in the User Tools group.

![Frame Model Icon]

The 2D Frame Model dialog opens.

4. Type the number of bays in the horizontal and vertical directions.

5. Type the spacing for the bays in the horizontal and vertical directions (X and Y, respectively).

6. Select the Support Type.

7. Click OK.

The frame with supports is generated.

OS. Frame.vbs Macro

This is the full contents of the Frame.vbs file. You can copy this by clicking Copy to Clipboard below and paste into the STAAD.Pro Macro Editor window.

Note: The first line of the following code points includes the OpenSTAADUI reference. It is added to your macro by OS. To connect the STAAD.Pro Script Editor to STAAD Object Library (on page 6965). It is not displayed within in the STAAD.Pro Script Editor, though.

```
' #Reference {EDA9FA7F-EFC9-4264-9513-39CF6E72604D}#1.0#0#C:\Program Files\Bentley Engineering\STAAD.Pro CONNECT Edition\STAAD\StaadPro.dll#OpenSTAADUI#OpenSTAADUI
```
Sub Main()

'DESCRIPTION: Create a 2D frame with supports

Begin Dialog UserDialog 600,200,"2D Frame Model"  %GRID:5,5,1,1
  Text 20,20,190,15,"No. of Horizontal Bays: ",.Text1
  Text 20,45,190,15,"No. of Vertical Bays",.Text2
  Text 20,70,190,15,"Vertical Distance",.Text3
  Text 20,95,190,15,"Horizontal Distance",.Text4

Alternate Control

If a user is asked to choose among three or more options, often a drop-down list is a better choice of control for the user interface. The macro can altered slightly to use a drop-down list. The list is populated by an array of strings which must be declared and populated before the dialog definition.

Sub Main()
'DESCRIPTION:Create a 2D frame with supports
Dim arrSupports
arrSupports = Array("Fixed","Pinned")
Begin Dialog UserDialog 600,200,"2D Frame Model" ' %GRID:5,5,1,1
Text 20,20,190,15,"No. of Horizontal Bays:“,.Text1
Text 20,45,190,15,"No. of Vertical Bays“,.Text2
Text 20,70,190,15,"Vertical Distance“,.Text3
Text 20,95,190,15,"Horizontal Distance“,.Text4
Text 20,130,190,15,"Support Type“,.Text5
TextBox 220,20,130,15,.clmn
TextBox 220,40,130,15,.row
TextBox 220,70,130,15,.ht
TextBox 220,95,130,15,.wdth
DropListBox 240,130,130,50,arrSupports(),.sprt
OKButton 360,165,90,20
CancelButton 490,165,90,20
End Dialog
Dim dlg As UserDialog

The rest of the macro code is unchanged. The selection from the drop-down list is passed as the position in the array selected (e.g., "0" for the first position,"1" for the next position, etc.).

OS. STAAD Pro Script Editor window

This application is used to write macros for use with STAAD.Pro. It is a small yet powerful programming application with tools for helping you create and debug macros.
Tip: The STAAD.Pro Script Editor is built on the WinWrap® Basic Editor platform. Select the Help tool in the top-right corner of the application to get help on both the WinWrap application as well as the WinWrap Basic language, which supports Visual Basic .NET™.

</table>

**OS. UserDialog Editor**

Used to create end-user dialogs for your macro. This will generate the **Begin Dialog...End Dialog** block in the macro code.

The editing tools are located along the top toolbar.

The user interface items are on tool pallet on the left side. Click any tool to active that item for layout. Then click in the dialog view to place that tool.

**OS. References dialog**

Used to include references for APIs, including OpenSTAAD.
OS. Examples

The following examples of macros can be added to run in STAAD.Pro via the **Macro** dialog.

**OS. Retrieve Dynamic Output**

The following example macro uses several OpenSTAAD dynamic output functions to build a mode shape report for the results of a dynamic analysis.

**About this Example**

This macro first verifies if analysis results are available. If so, it then begins printing information into a text results file. If the number of modes extracted are greater than zero, then the modal frequencies, mass modal participation factors, and modal deflections are printed to this report.

This code can be saved to a `.vbs` file directly or pasted into the macro editor in a macro project for use in STAAD.Pro.

```vbs
Option Explicit

Sub Main()

**OS. Envelopes Table Macro**

The purpose of this macro is to create a results table in STAAD.Pro containing an envelope of results.

The macro contains the following routines:

1. **Main.** This is the primary routine from which the macro is launched and checks that STAAD.Pro is running and the model loaded has available results which are needed for this example. However if the table you wish to construct does not require the model to have been analysed, then clearly that part of the routine can be removed.
2. STAADTable. Once the validation is done, this routine is called to produce the table in STAAD.Pro. As this table will require a selection of load cases, it includes a call to a routine to select load cases called SelectLoadCases, then the routine to create the empty table called CreateTable and finally to fill the table with data called FillTable.

3. ResetEnvTable. A simple routine to make sure the table is cleared and a label added in column 1 of each row for this example to mirror the labels used in the general Envelope sheet of the Node displacement table.

4. SelectLoadCases. This is routine that displays a user dialog to select the load cases and combinations from which the node displacements will be used to form the final table. This makes use of a couple of other routines AddLoadCaseToSelected and ExcludeLoadCaseFromSelected to maintain two lists of load cases, those that are available from STAAD.Pro and those that will be used to create the table.

5. AddLoadCaseToSelected. When [>] is clicked, this routine adds the selected load cases.

6. ExcludeLoadCaseFromSelected. When Exclude is clicked, the load case in the selected Load Case list is removed from the list.

7. CreateEnvList. A simple routine that creates a list of the load case numbers from the text of the dialog box Selected Load Cases.

8. FillTable. Populates the table with the calculated data which has been put into a two-dimensional array (i.e., row, column)

9. CreateTable. The routine that forms the table framework and sets the headings. Note that it also checks to see the unit system so that the headers can include the appropriate units. Also note that there are commented out lines that indicate how additional sheets can be added to the Report that could be used for other data such as End Forces or Reactions.

---

Macro Code

To use this macro, copy and the paste the code into a .vbs file (e.g., Table Envelope.vbs). Then OS. To import an existing macro (on page 6964) into STAAD.Pro to use it.

```vbs
’#Reference {EDA9FA7F-EFC9-4264-9513-39CF6E72604D}#1.0#0#C:\Program Files \Bentley\Engineering\STAAD.Pro CONNECT Edition\STAAD \StaadPro.dll#OpenSTAADUI#OpenSTAADUI
’Simple Macro using OpenSTAAD to create a table of envelopes.

    Tables.SetColumnHeader rptno, tblNodeDisplacement, 5, "Y"
OS. Macros Included with STAAD.Pro

Several macros are installed with the program.

These Visual Basic files are installed in 
C:\Program Files\Bentley\Engineering\STAAD.Pro CONNECT Edition\STAAD\PlugIns\VBS by default.

**Note:** Additional information on using these macros in the program can be found in [Utilities tab](#) (on page 2914).

<table>
<thead>
<tr>
<th>File name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Material.vbs</td>
<td>Reads entries in the file MaterialSpreadsheet.csv and displays a list of the material/grade names. Users can add the selection as a material definition to the model.</td>
</tr>
<tr>
<td>EuroCombinations.vbs</td>
<td>Used to add combinations with load factors per the Eurocode to the model.</td>
</tr>
<tr>
<td>ObjectIDs.vbs</td>
<td>Generates a table that displays GUIDs of nodes, members, and physical members.</td>
</tr>
<tr>
<td>ObjectUpdateReport.vbs</td>
<td>This macro can be used to create two Object ID reports, one capturing the situation before the STAAD model went through the CIS/2 Update tool and one post-update. By comparing the two reports, you can find out which entities are newly introduced due to update workflow and if this is the intended result (i.e., should those be new or should have retained the original GUID, but got changed due to a workflow problem/bug, etc.).</td>
</tr>
<tr>
<td>STAAD2SACS.vbs</td>
<td>Used to export the model data to a Bentley SACS model.</td>
</tr>
<tr>
<td>ToAutoPipePub.vbs</td>
<td>Used to export the model data to a Bentley AutoPIPE model.</td>
</tr>
</tbody>
</table>
OS. Writing OpenSTAAD in Other Programming Languages

You can write scripts or even standalone applications which utilize STAAD.Pro through OpenSTAAD. This requires a separate environment in which to write the code (typically an integrated development environment, or IDE) as well as a code interpreter for the programming language you use.

COM Compliant Languages

Any program language capable of calling Windows Component Object Model (COM) components may be used. While it isn’t feasible to document the usage of all such languages, some commonly used options are described here.

Although OpenSTAAD supports all major programming languages used today capable of calling COM components, it is impractical to document the usage of each and every function in all of these languages.

Using a Development Environment

Unlike writing macros in the STAAD.Pro Script Editor or in a Visual Basic for Application Editor in an Office application, writing code in another programming language requires a development environment. This is any sort of application that allows you to both edit and run code. These development environments often come with coding aids such as autocompletion features, error detection and suggestions, compilers, and more. This is typically referred to as an Integrated Development Environment (or IDE).

There are many different commercial and open source IDE options, but these guides will typically stick with Microsoft’s Visual Studio 2019. This is widely used IDE and the Community edition can be used for free at https://visualstudio.microsoft.com/downloads/.

OS. Getting Started with Python

This section will provide you with the information needed to set up an OpenSTAAD project written in Python.

**Note:** While this doesn’t assume that you have extensive Python programming knowledge, it also is not intended to teach the Python programming language. There are many excellent resources available to learn Python, which is beyond the scope of the OpenSTAAD documentation.

OS. OpenSTAAD and Python

OpenSTAAD is compatible with any programming language that supports COM objects, such as Python. However, there are some limitations when using Python of which you should be aware:

- Many editors or IDEs don’t support auto-completion due to the COM object implementation.
- OpenSTAAD methods aren’t automatically detected, so your program must explicitly identify each.
- Passing arrays to the OpenSTAAD COM object requires some additional effort

OS. Set Up Your Coding Environment

In order to program OpenSTAAD in Python, you will need to set up a development environment.
A develop environment is typically a program that supports writing the code as well as a suite of tools to make that job easier. While computer code could be written in any plain text editor, an integrated development environment (IDE) will make the job much easier and more efficient. For this guide, you will use Microsoft Visual Studio Code. This is a popular programming editor which is free to use and supports many different programming languages through a wide array of extensions.

Note: Microsoft has an excellent reference on getting started programming in python within Visual Studio Code at https://code.visualstudio.com/docs/python/python-tutorial.

You are free to use any editor or IDE of your choice, so long as you have the pywin32 extension added. For example, if you are comfortable with using Visual Studio 2019, you can read about using Python in Visual Studio at https://docs.microsoft.com/en-us/visualstudio/python/.

1. Download and install Visual Studio Code from https://code.visualstudio.com/
2. Install a python interpreter.
   This is the python language version you will be using. This performs the actual operations of your code. You can download Python from https://www.python.org/downloads/.
   
   Note: It is recommended that you install Python 3.8, which is the latest version at the time this guide was written.

3. Launch the Visual Studio Code application.
   The extension is used to help you easily write Python code in the editor. It can also interact with a interpreter to allow you to run and debug the code from within the editor itself.
   a. Select the Extensions tab (or press <Ctrl+Shift+X>).
   b. Search for the term “python”.
   c. Select the Python extension (named ms-python.extension).
   d. Click Install.

   Note: The Python extension will also later prompt you to install a linter (used to provide useful feedback and error detection) and IntelliSense code completion. These are recommended and useful tools for any editor or IDE.

5. Verify the Python installation.
   b. Type `py --version` and the press <Enter>.
      The terminal should return with the version of python you have installed.

   Note: If you have multiple versions of Python installed on your computer, you may need to select the most recent version in the status bar of the Visual Studio Code program window.

6. Install pywin32.
   This allows COM objects to interact with Python and is required for using OpenSTAAD in Python. You will use a package management system built into the Python extension to download an install this.
   a. Open a new terminal in Visual Studio Code by either:
      selecting Terminal > New Terminal
      or
      press <Ctrl+Shift+`
   b. Type `pip install pywin32` and then press <Enter>.

OpenSTAAD

OS. Writing OpenSTAAD in Other Programming Languages

STAAD.Pro 7006 User Manual
c. Close the Powershell window.

OS. Start Your Python Project

This quick set of steps demonstrates how to set up your workspace for a Python project.

1. In Visual Studio Code, save your new workspace to a convenient location. For example, C:/OS_Py/OpenSTAAD_Python_Tutorial.workspace. The workspace in Visual Studio Code serves as your working folder for saving and executing code.
2. Create a new file.
3. Save the file with a ".py" file extension. This automatically instructs Visual Studio Code to interpret the input as Python.

**Note:** If you did not previously install the Python extension, then the program prompts you to do so. Also, if you have not previously installed a linter and code completion option, then the program prompts you to do so. These are recommended.

4. In the main editor window, begin typing commands. For example, type `print("Hello World!").`
5. Select the Run tool to execute your code. The terminal will open and display the results.
6. Save your code.

While having your computer return “Hello World!” may be a classic example of a first program, it is not a very practical tool. However, you now have a file set up to create a more useful OpenSTAAD project in your next example.

OS. Write an OpenSTAAD Program in Python

This example will introduce you to several concepts necessary to writing OpenSTAAD applications in Python.

**Tip:** If you followed the previous “Hello World!” example, you may simply delete that line and start from that point.

OS. Initiate OpenSTAAD in Python

**Note:** You must have a model open in STAAD.Pro for this example. Otherwise your code will return an error.

1. Type `import win32com.client` and then press `<Return>`. This uses the pywin32 extension for Windows to allow you to use COM objects (such as OpenSTAAD).
2. Type `os = win32com.client.GetActiveObject("StaadPro.OpenSTAAD")` and then press `<Return>`. This initiates OpenSTAAD and connects to the current STAAD.Pro model to your program.

Your program at this point should look like:
```python
import win32com.client
os = win32com.client.GetActiveObject("StaadPro.OpenSTAAD")
```

### OS. Use Geometry Methods

1. Type `geometry = os.Geometry` and then press `<Return>`. This defines the geometry variable as the Geometry group of methods in OpenSTAAD.

2. Type `geometry._FlagAsMethod("GetNodeCount") geometry._FlagAsMethod("GetMemberCount")` and then press `<Return>`. This is required to correctly identify the OpenSTAAD methods as such in Python.

   **Note:** This approach is required for this first time you use a method in a python program using OpenSTAAD method. It is not required for each time that method is re-used within the same code.

3. Type `nodeCount = geometry.GetNodeCount` and then press `<Return>`. This uses the OpenSTAAD method `GetNodeCount()` to return the number of nodes in the active STAAD.Pro model into the specified variable.

4. Type `beamCount = geometry.GetMemberCount` and then press `<Return>`. Similarly, this uses the OpenSTAAD method `GetMemberCount()` to return the number of members in the active STAAD.Pro model into the specified variable.

   **Tip:** Reference the OpenSTAAD documentation for details on available methods and what values are accepted as input or returned from each.

Your program at this point should look like:
```python
import win32com.client
os = win32com.client.GetActiveObject("StaadPro.OpenSTAAD")
geometry = os.Geometry
geometry._FlagAsMethod("GetNodeCount")
geometry._FlagAsMethod("GetMemberCount")
nodeCount = geometry.GetNodeCount
beamCount = geometry.GetMemberCount
```

### OS. Generate OpenSTAAD Output

1. Type `print( str(nodeCount) + ' joints')` and then press `<Return>`. Working from the inner-most operation outward, this line is first converting the numerical result stored in `nodeCount` to a string. This is then combined with the text string 'joints' to make the output easier to interpret. Then the entire concatenated string is being printed to the terminal.

2. Type `print(str(beamCount) + ' members')`. Similarly, this is concatenating the `beamCount` value, converted to a string, with some text and displaying that result to the terminal.
Your final program should look like:

```python
import win32com.client
os = win32com.client.GetActiveObject("StaadPro.OpenSTAAD")
geometry = os.Geometry
geometry._FlagAsMethod("GetNodeCount")
geometry._FlagAsMethod("GetMemberCount")
nodeCount = geometry.GetNodeCount
beamCount = geometry.GetMemberCount
print(str(nodeCount) + ' joints')
print(str(beamCount) + ' members')
```

**OS. Run Your Code**

You should now have a working piece of python code which will provide you information about the currently active STAAD.Pro model. You'll now run the code to test it.

1. Save your progress by either:
   - selecting **File > Save**
   - or
   - pressing **<Ctrl+S>**

2. Select the **Run** tool to execute your code.
   The terminal will open and display the results.

**Tip:** You may notice the Powershell instruction used to perform this action. This command can be used from any Powershell window outside of Visual Studio Code to run your program.

It is best practice to annotate your code with comments. This allows others to easily understand what your code is doing (or at least what your intention was). The full example here contains comments accordingly.
OS. What if it Didn’t Work?

If you did not already do so, be sure to install a linter. This provides useful feedback on your python program along with helpful hints to optimize the code.

The IDE should also provide you feedback on any detected issues with the code. Much like a spell check or grammar check in a word processor, this can alert you to errors before you ever run the code.

Verify that the full environment is set up, including the python interpreter (Python v3.8.n), the pywin32 extension, and that you have a model open in STAAD.Pro. While not all STAAD.Pro programs do require an active model in STAAD.Pro, this particular program does.

You can use the debugging tools in Visual Studio Code to help “step” through the code interpretation to identify issues. Clicking to the left of the line number in the main code window will add a break point. Then select the Run tab (or press <Ctrl+Shift+D>). Click the Run and Debug button to start the process. The terminal will provide additional information as it runs the program and will pause at each break point.

Refer to the Visual Studio Code help for detailed information on using the debugging features in this editor.

OS. Interpreting OpenSTAAD API Syntax for Python

The functions documented for the OpenSTAAD are given in the C++ syntax. It’s typically a simple process to interpret these for use in a Python program.
Classes and Methods

Classes syntax are listed in the format OSClassUI : :Method. In Python, this should be instead given as Class.Method.

In the example, OpenSTAAD was instantiated using the variable “os”. Classes were then called using the format os.Class (for example, the Geometry class was referenced using os.Geometry). In the C++ syntax used in the documentation, where you see “OSClassUI”, instead simply use “Class” in Python.

The exception of course is the “root” OpenSTAAD functions, which will use whatever variable you have used to instantiate OpenSTAAD (looking to the example again, this would be os.GetBaseUnit). That is, the OpenSTAAD object acts as the class for these functions.

Note: In Python, you will have to use the _FlagAsMethod function to identify each OpenSTAAD method as a method once.

Return Values

The syntax listed indicates if a function has a return value with a leading “VARIANT”. This simply means that function will return a value that typically will be stored into a variable. If the function syntax is listed with a leading “void”, then there is no return value.

Note: A return value of a function is not to be confused with values stored in function parameters!

Variables and Parameters

The syntax listed typically indicates parameters as type “VARIANT FAR”, which is not necessarily useful. Instead, it is important that you read the parameter descriptions which will indicate what type of variable to use (i.e., “string”, “long”). In Python, you don’t have to declare a variable type, it will be decided when the value is interpreted. Of course, it does matter if the variable contains a string or a number and what type of number when you want to use it in another function. OpenSTAAD may return integers or floating point decimal places.

OS. Getting Started with C#

This section will provide you with the information needed to set up an OpenSTAAD project written in C#.

Note: While this doesn’t assume that you have extensive C# programming knowledge, it also is not intended to teach the C# programming language. There are many excellent resources available to learn C#, which is beyond the scope of the OpenSTAAD documentation.

OS. Set Up Your Coding Environment

In order to program OpenSTAAD in C#, you will need to set up a development environment.

A development environment is typically a program that supports writing the code as well as a suite of tools to make that job easier. While computer code could be written in any plain text editor, an integrated development environment (IDE) will make the job much easier and more efficient. For this guide, you will use Microsoft Visual Studio.

Note: Microsoft has an excellent reference on getting started programming in C# at https://docs.microsoft.com/en-us/dotnet/csharp/getting-started/.
1. Download and install the Visual Studio IDE by checking the steps from https://docs.microsoft.com/en-us/visualstudio/install/install-visual-studio
2. Launch the Visual Studio 2019 application

**OS. Start Your C# Project**

This quick set of steps demonstrates how to set up your workspace for a C# project. This procedure is adapted from a similar tutorial at https://docs.microsoft.com/en-us/visualstudio/get-started/csharp/tutorial-console.

1. In the Visual Studio start window, click **Create a new project**. The **Create a new project** window opens.
2. Filter the project templates using the following:
   a. Type console in the search field.
   b. Select # from the Language drop-down list.
   c. Select Windows from the Platform drop-down list.
3. Select the **Console App (.NET Framework)** from the results and then click **Next**. The **Configure your new project** window opens.
4. Type OpenSTAAD Demo in the **Project Name** field.
5. Click **Create**.
   Visual Studio opens your new project, which includes default “Hello World” code.
6. Add necessary dependencies to the manifest file:
   a. Right-click on your project’s name and then select **New Item > Application Manifest File**. The template for the **app.manifest** file opens.
   b. Add the following elements within the **<assembly>** element:

```
<comInterfaceExternalProxyStub name="IOSMemberSteelDgnParams" iid="{F40BDCDA-B3DE-495C-B84F-790F4456137F}" tidbld="{EDA9FA7F-ECF9-4264-9513-39CF6E72604D}"

```
OS. Write an OpenSTAAD Program in C#

This example will introduce you to several concepts necessary to writing OpenSTAAD applications in C#.

The example C# project for Visual Studio 2019 can be downloaded [here](#).

**Tip:** If you followed the previous “Hello World!” example, you may simply delete that line and start from that point.

### OS. Initiate OpenSTAAD in C#

**Note:** You must have a model open in STAAD.Pro for this example. Otherwise your code will return an error.

1. Add a namespace by typing: `using System.Runtime.InteropServices;`
   This namespace provides a wide variety of members that support COM interop and platform invoke services.
2. Type `OpenSTAADUI.OpenSTAAD os = Marshal.GetActiveObject("StaadPro.OpenSTAAD") as OpenSTAADUI.OpenSTAAD;` and then press `<Return>.
   This initiates OpenSTAAD and connects to the current STAAD.Pro model to your program.
Your program at this point should look like:
```csharp
using System;  
using System.Runtime.InteropServices;  
namespace OSEOMConsoleApp  
{  
class Program  
{  
    static void Main (string[] args)  
    {  
        OpenSTAADUI.OpenSTAAD os = Marshal.GetActiveObject("StaadPro.OpenSTAAD") as OpenSTAADUI.OpenSTAAD;  
        OpenSTAADUI.OSGeometryUI geometry = os.Geometry;  
        int nodeCount = geometry.GetNodeCount();  
        int beamCount = geometry.GetMemberCount();  
    }  
}  
}
```

OS. Use Geometry Methods

1. Type `OpenSTAADUI.OSGeometryUI geometry = os.Geometry;` and then press <Return>.
   This defines the geometry variable as the Geometry group of methods in OpenSTAAD.

2. Type `int nodeCount = geometry.GetNodeCount();` and then press <Return>.
   This uses the OpenSTAAD method `GetNodeCount()` to return the number of nodes in the active STAAD.Pro model into the specified variable.

3. Type `int beamCount = geometry.GetMemberCount();` and then press <Return>.
   Similarly, this uses the OpenSTAAD method `GetMemberCount()` to return the number of members in the active STAAD.Pro model into the specified variable.

   **Tip:** Reference [the OpenSTAAD documentation](https://www.openstaad.com/documentation) for details on available methods and what values are accepted as input or returned from each.
OS. Generate OpenSTAAD Output

1. Type `Console.WriteLine("Node Count = " + nodeCount);` and then press `<Return>`. The numerical `nodeCount` value is concatenated with some string to print in a readable format.

2. Type `Console.WriteLine("Beam Count = " + beamCount);`. Similarly, this is concatenating the `beamCount` value, converted to a string, with some text and displaying that result to the terminal.

Your final program should look like:

```csharp
using System;
using System.Runtime.InteropServices;
namespace OSEOMConsoleApp
{
    class Program
    {
        static void Main (string[] args)
        {
            OpenSTAADUI.OpenSTAAD os = Marshal.GetActiveObject("StaadPro.OpenSTAAD") as OpenSTAADUI.OpenSTAAD;
            OpenSTAADUI.OSGeometryUI geometry = os.Geometry;
            int nodeCount = geometry.GetNodeCount();
            int beamCount = geometry.GetMemberCount();
            Console.WriteLine("Node Count = " + nodeCount);
            Console.WriteLine("Beam Count = " + beamCount);
            Console.ReadLine();
        }
    }
}
```

OS. Run Your Code

You should now have a working piece of C# code which will provide you information about the currently active STAAD.Pro model. You’ll now run the code to test it.

1. Save your progress by either:
   - selecting File > Save
   - or
   - pressing `<Ctrl+S>`
2. Press `<Ctrl+F5>` to run your project. The terminal will open and display the results.

It is best practice to annotate your code with comments. This allows others to easily understand what your code is doing (or at least what your intention was). The full example here contains comments accordingly.
Figure 568: Microsoft Visual Studio 2019 running a C# example

OS. Notes on Using C# with OpenSTAAD

While getting the OpenSTAAD object by doing:

```csharp
OpenSTAADUI.OpenSTAAD os = Marshal.GetActiveObject("StaadPro.OpenSTAAD") as OpenSTAADUI.OpenSTAAD;
```

using 'Staadpro.Openstaad' will give you access to the running instance of STAAD.Pro which was first started.

If there are multiple instances of STAAD.Pro open, and you want access to an instance then use the following code:

```csharp
public static OpenSTAADUI.OpenSTAAD GetStaadUiInterface (string staadFilename)
{
    string lookUpCandidateName = RotMethods.GetStaadProCandidateNameToLookUpInRot();
    if ( string.IsNullOrEmpty(lookUpCandidateName) )
    {
        return null;
    }
    if ( string.IsNullOrEmpty(staadFilename) )
    {
        return null;
    }
    string staadFileFullPath = Path.GetFullPath(staadFilename).ToUpper();
    foreach ( RotMethods.RotObjectInfo item in runningObjects )
    {
        try
        {
            string candidateName = item.Name.ToUpper();
        }
        catch ( Exception )
        {
```
// if this call succeeds, then it is a valid path, else it will continue
string extStr = Path.GetExtension(candidateName).ToUpper();
{
    OpenSTAADUI.OpenSTAAD osObject = null;
    if ( !string.IsNullOrEmpty(extStr) )
    {
        // check if it’s a valid STAAD file
        if ( extStr == ".STD" )
        {
            osObject = item.Value as OpenSTAADUI.OpenSTAAD;
            if ( osObject != null )
            {
                // get staad filename
                string openedStaadFile = GetOpenedStaadFilename(osObject).ToUpper();
                if ( string.Compare(staadFileFullPath,
                    openedStaadFile, StringComparison.OrdinalIgnoreCase) == 0 )
                {
                    return osObject;
                }
            }
        }
    }
    if ( candidateName.StartsWith(lookUpCandidateName) )
    {
        // we got the staad instance
        osObject = item.Value as OpenSTAADUI.OpenSTAAD;
        if ( osObject != null )
        {
            // get staad filename
            string lookupStaadFilename = GetOpenedStaadFilename(osObject);
            if ( string.Compare(staadFileFullPath,
                lookupStaadFilename, StringComparison.OrdinalIgnoreCase) == 0 )
            {
                return osObject;
            }
        }
    }
    catch ( Exception ex )
    {
        throw;
    }
}
return null;

private static string GetOpenedStaadFilename (OpenSTAADUI.OpenSTAAD osObject)
{
    // get staad filename
    string staadFilename = "",
    bool includeFullPath = true;
object oArg1 = staadFilename as object;
object oArg2 = includeFullPath as object;
osObject.GetSTAADFile(ref oArg1, oArg2);
staadFilename = oArg1 as string;
if ( staadFilename != null )
    return Path.GetFullPath(staadFilename);
// return null;
}

Call the GetStaadUiInterfaceInternal (string staadFilename) method as
OpenSTAADUI.OpenSTAAD os = GetStaadUiInterface (@"C:\Test.std");

The following helper methods should be added:

[DllImport("ole32.dll")]
private static extern int GetRunningObjectTable (int reserved, out
IRunningObjectTable prot);

[DllImport("ole32.dll")]
private static extern int CreateBindCtx (int reserved, out IBindCtx ppbc);

public class RotObjectInfo
{
    public string Name
    {
        get;
        set;
    }

    public object Value
    {
        get;
        set;
    }
}

public static List<RotObjectInfo> GetRunningObjectList ()
{
    try
    {
        var result = new List<RotObjectInfo>();
        var numFetched = new IntPtr();
        IRunningObjectTable runningObjectTable;
        IEnumMoniker monikerEnumerator;
        var monikers = new IMoniker[1];
        GetRunningObjectTable(0, out runningObjectTable);
        runningObjectTable.EnumRunning(out monikerEnumerator);
        monikerEnumerator.Reset();
        while ( monikerEnumerator.Next(1, monikers, numFetched) == 0 )
        {
            IBindCtx ctx;
            CreateBindCtx(0, out ctx);
            string runningObjectName;
OS. Getting Started with C++

This section will provide you with the information needed to set up an OpenSTAAD project written in C++.

**Note:** While this doesn’t assume that you have extensive C++ programming knowledge, it also is not intended to teach the C++ programming language. There are many excellent resources available to learn C++, which is beyond the scope of the OpenSTAAD documentation.

OS. Set Up Your Coding Environment

In order to program OpenSTAAD in C++, you will need to set up a development environment.

A develop environment is typically a program that supports writing the code as well as a suite of tools to make that job easier. While computer code could be written in any plain text editor, an integrated development environment (IDE) will make the job much easier and more efficient. For this guide, you will use Microsoft Visual Studio.

1. Download and install the Visual Studio IDE by checking the steps from [https://docs.microsoft.com/en-us/visualstudio/install/install-visual-studio](https://docs.microsoft.com/en-us/visualstudio/install/install-visual-studio)
2. Launch the Visual Studio 2019 application

OS. Start Your C++ Project

This quick set of steps demonstrates how to set up your workspace for a C++ project.

This procedure is adapted from a similar tutorial at [https://docs.microsoft.com/en-us/cpp/build/vscpp-step-1-create](https://docs.microsoft.com/en-us/cpp/build/vscpp-step-1-create).
1. In the Visual Studio start window, click **Create a new project**. The **Create a new project** window opens.

2. Filter the project templates using the following:
   a. Type **console** in the search field.
   b. Select **C++** from the Language drop-down list.
   c. Select **Windows** from the Platform drop-down list.

3. Select the **Console App** from the results and then click **Next**. The **Configure your new project** window opens.

4. Type **OpenSTAAD Demo** in the **Project Name** field.

5. Click **Create**. Visual Studio opens your new project, which includes default "Hello World" code.

6. Add the staadpro.dll dependency to the project file:
   This adds OpenSTAAD as a COM file reference.
   a. Open the project's .vcxproj file.
   b. Add the following element to the start of the ItemGroup element:
      ```xml
      <COMFileReference Include="C:\Program Files\Bentley\Engineering\STAAD.Pro CONNECT Edition\STAAD\StaadPro.dll">
          <EmbedInteropTypes>True</EmbedInteropTypes>
      </COMFileReference>
      ```
   c. Save and close the project file.

---

**OS. Write an OpenSTAAD Program in C++**

This example will introduce you to several concepts necessary to writing OpenSTAAD applications in C++.

The example C++ project for Visual Studio 2019 can be downloaded here.

**Tip:** If you followed the previous “Hello World!” example, you may simply delete that line and start from that point.

---

**OS. Initiate OpenSTAAD in C++**

**Note:** You must have a model open in STAAD.Pro for this example. Otherwise your code will return an error.

1. Create and add a manifest file to your C++ project:
   a. Create a new file and save it somewhere convenient with a .manifest file extension.
   b. Right-click on your project from within Visual Studio and then select **Add > Existing Item** from the pop-up menu.
   c. Browse to the manifest file and select it.
   d. Open the manifest file and add the following contents:
      ```xml
      <?xml version="1.0" encoding="UTF-8" standalone="yes"?>
      <assembly xmlns="urn:schemas-microsoft-com:asm.v1" manifestVersion="1.0">
          <trustInfo xmlns="urn:schemas-microsoft-com:asm.v3">
              <security>
                  <requestedPrivileges>
                      <requestedExecutionLevel level="asInvoker" uiAccess="false"></requestedExecutionLevel>
                  </requestedPrivileges>
              </security>
          </trustInfo>
      </assembly>
      ```
2. Import the StaadPro.dll by typing: 

```
#import "C:\Program Files\Bentley\Engineering\STAAD.Pro
CONNECT Edition\STAAD\StaadPro.dll" named_guids
```

and then press <Return>.

3. Set the namespace by typing namespace OSApp = OpenSTAADUI; and then press <Return>.

This namespace provides a wide variety of members that support COM interop and platform invoke services.

4. Place the cursor inside the `int main()`.
5. Add the following lines:

```cpp
OSApp::IOpenSTAADUIPtr OSAppPtr;
CoInitialize(NULL);
HRESULT hr = OSAppPtr.CreateInstance(__uuidof(OSApp::OpenSTAAD));
if (hr != S_OK)
{
    printf("Unable to connect to STAAD.Pro application!\n");
    return 1;
}
hr = OSAppPtr.GetActiveObject(__uuidof(OSApp::OpenSTAAD));
```

This initiates OpenSTAAD and connects to the current STAAD.Pro model to your program.

`CreateInstance` creates an uninitialized object and `GetActiveObject` retrieves a pointer to a running object that has been registered with OLE.

Your program at this point should look like:

```cpp
#import "C:\Program Files\Bentley\Engineering\STAAD.Pro CONNECT Edition\STAAD\StaadPro.dll" named_guids
using namespace OpenSTAADUI;
using namespace std;
namespace OSApp = OpenSTAADUI;

int main()
{
    OSApp::IOpenSTAADUIPtr OSAppPtr;
    try
    {
        CoInitialize(NULL);
        HRESULT hr = OSAppPtr.CreateInstance(__uuidof(OSApp::OpenSTAAD));
        if (hr != S_OK)
        {
            printf("Unable to connect to STAAD.Pro application!\n");
            return 1;
        }
        hr = OSAppPtr.GetActiveObject(__uuidof(OSApp::OpenSTAAD));
        if (hr != S_OK)
        {
            printf("Unable to connect to an active instance of STAAD.Pro application!\n");
            return 1;
        }
    }
    catch (_com_error& e)
    {
        _bstr_t bstrDescription = e.Description();
        printf("COM Error! %s\n", bstrDescription);
    }
}
```
OS. Use Geometry Methods

1. At the beginning of the main() - on a new line after `OSApp::IOpenSTAADUIPtr OSAppPtr;`, type `OSApp::IOSGeometryUIPtr OSGeomPtr;` and then press `<Return>`.
2. Place your cursor just inside the closing curly bracket (`{`) of the main() and then press `<Return>`.
3. Type `OSGeomPtr = OSAppPtr->GetGeometry();` and then press `<Return>`.
   This defines the geometry variable as the Geometry group of methods in OpenSTAAD.
4. Type `int nNodes = OSGeomPtr->GetNodeCount();` and then press `<Return>`.
   This uses the OpenSTAAD method `GetNodeCount()` to return the number of nodes in the active STAAD.Pro model into the specified variable.
5. Type `int nMembers = OSGeomPtr->GetMemberCount();` and then press `<Return>`.
   Similarly, this uses the OpenSTAAD method `GetMemberCount()` to return the number of members in the active STAAD.Pro model into the specified variable.

**Tip:** Reference the OpenSTAAD documentation for details on available methods and what values are accepted as input or returned from each.

Your program at this point should look like:
```cpp
#include "pch.h"
#include <iostream>
#include "C:\Program Files\Bentley\Engineering\STAAD.Pro CONNECT Edition\STAAD\StaadPro.dll" named_guids
using namespace OpenSTAADUI;
using namespace std;
namespace OSApp = OpenSTAADUI;
int main()
{
    OSApp::IOpenSTAADUIPtr OSAppPtr;
    OSApp::IOSGeometryUIPtr OSGeomPtr;
    try
    {
        CoInitialize(NULL);
        HRESULT hr = OSAppPtr.CreateInstance(__uuidof(OSApp::OpenSTAAD));
        if (hr != S_OK)
        {
            printf("Unable to connect to STAAD.Pro application!\n");
            return 1;
        }
        hr = OSAppPtr.GetActiveObject(__uuidof(OSApp::OpenSTAAD));
        if (hr != S_OK)
        {
            printf("Unable to connect to an active instance of STAAD.Pro application!\n");
            return 1;
        }
        OSGeomPtr = OSAppPtr->GetGeometry();
```
```
int nNodes = OSGeomPtr->GetNodeCount();
int nMembers = OSGeomPtr->GetMemberCount();
}
catch (_com_error& e)
{
    _bstr_t bstrDescription = e.Description();
    printf("COM Error! %s\n", bstrDescription);
}

OS. Generate OpenSTAAD Output

1. Type printf("No. of Nodes: %d\n", nNodes); and then press <Return>.

   We are using printf to print the formatted data to stdout. The number of nodes is printed in a readable
   format to the console.

2. Type printf("No. of Members: %d\n", nMembers);

   Similarly, this is concatenating the beamCount value, converted to a string, with some text and displaying
   that result to the terminal.

Your final program should look like:

```cpp
#include "pch.h"
#include <iostream>
#import "C:\Program Files\Bentley\Engineering\STAAD.Pro CONNECT Edition\STAAD\StaadPro.dll" named_guids
using namespace OpenSTAADUI;
using namespace std;
namespace OSApp = OpenSTAADUI;
int main()
{
    OSApp::IOpenSTAADUIPtr OSAppPtr;
    OSApp::IOSGeometryUIPtr OSGeomPtr;

    try
    {
        CoInitialize(NULL);
        HRESULT hr = OSAppPtr.CreateInstance(__uuidof(OSApp::OpenSTAAD));

        if (hr != S_OK)
        {
            printf("Unable to connect to STAAD.Pro application!\n");
            return 1;
        }

        hr = OSAppPtr.GetActiveObject(__uuidof(OSApp::OpenSTAAD));
        if (hr != S_OK)
        {
            printf("Unable to connect to an active instance of STAAD.Pro application!\n");
            return 1;
        }

        OSGeomPtr = OSAppPtr->GetGeometry();
    }
    catch (_com_error& e)
    {
        _bstr_t bstrDescription = e.Description();
        printf("COM Error! %s\n", bstrDescription);
    }
```
int nNodes = OSGeomPtr->GetNodeCount();
int nMembers = OSGeomPtr->GetMemberCount();
printf("No. of Nodes: %d\n", nNodes);
printf("No. of Members: %d\n", nMembers);
}
catch (_com_error& e)
{
    _bstr_t bstrDescription = e.Description();
    printf("COM Error! %s\n", bstrDescription);
}

OS. Run Your Code
You should now have a working piece of C++ code which will provide you information about the currently active
STAAD.Pro model. You'll now run the code to test it.

1. Save your progress by either:
   
      selecting File > Save

      or

      pressing <Ctrl+S>

2. Press <Ctrl+F5> to run your project.
   The terminal will open and display the results.
   
   It is best practice to annotate your code with comments. This allows others to easily understand what your code
   is doing (or at least what your intention was). The full example here contains comments accordingly.
OS. Getting Started with Visual Basic

This section will provide you with the information needed to set up an OpenSTAAD project written in Visual Basic.

OS. Set Up Your Coding Environment

In order to program OpenSTAAD in Visual Basic, you will need to set up a development environment. A development environment is typically a program that supports writing the code as well as a suite of tools to make that job easier. While computer code could be written in any plain text editor, an integrated development environment (IDE) will make the job much easier and more efficient. For this guide, you will use Microsoft Visual Studio 2019. This is a popular IDE which is free to use with a Community license and supports many different programming languages.

Figure 569: Microsoft Visual Studio 2019 running a C++ example
2. When installing, select the **Workload** for Windows **.NET desktop development**.
   This includes the Visual Basic compiler.

Microsoft also has thorough documentation on programming in Visual Basic: [https://docs.microsoft.com/en-us/visualstudio/get-started/visual-basic/?view=vs-2019](https://docs.microsoft.com/en-us/visualstudio/get-started/visual-basic/?view=vs-2019)

### OS. Visual Basic Conventions

#### Comments

In Visual Basic or Visual Basic for Applications, an apostrophe (‘) is used to denote a comment. Anything to the right of the apostrophe will be ignored by the program.

**Tip:** Throughout this documentation, these are displayed in the color green to make comments visually distinct from the remaining code.

#### Declaring Arrays

VB/VBA is flexible in the way it allows arrays to be declared. Most examples involving arrays in this reference manual will conform to the C++ zero indexing convention. In an array of 6 values, the positions in the array are referred to as 0-5. Therefore an array of 6 values would be declared as follows:

```vbnet
Dim pdArray(5) As Double
```

or

```vbnet
Dim pdArray(0 To 5) As Double
```

In VB, a six value array can also be declared as:

```vbnet
Dim pdArray(1 To 6) As Double
```

In doing so, however, we might find that our loops and other statements used to access the various positions in the array might not work correctly in C++.

#### Line Continuation Character

A long coding statement can be written on more than one line, to make the code easier to read. The VB line continuation character consists of a space followed by an underscore at the end of the line. The line of code beneath the continuation character will be handled as though it was written on the same line as the line continuation character.

#### Functions and Subroutines

Though functions and subroutines perform similar actions in any language, it is important to understand a key difference in order to make writing OpenSTAAD macros easier. A function can return a value back to the function or routine that called it. A subroutine, on the other hand, does not directly return a value. Instead, a subroutine
must make use of the ByRef methodology internally. OpenSTAAD has been written so that you can use many of its functions to return more than one value via a single function. While this is a very powerful feature, it can lead to some confusion given how VB syntax uses parenthesis. In VB syntax, a subroutine does not use parenthesis to enclose any values which are passed to it. VB reserves their use for functions only.

Thus, in OpenSTAAD the subroutines which are used to return multiple values from the model input, analysis results, or design results are required to use the subroutine syntax.

**Note:** As this is a merely a result of VB syntax and not that these OpenSTAAD functions behave differently, the documentation simply refers them all as "functions."

**Tip:** Often, though, the data passed in such a function is in the form of an array, which do use parenthesis (without a space) to indicate their dimensions.

```vbnet
Example

objOpenSTAAD.GetNodeDisplacements nNodeNo, nLC, pdDisps(0)
'The line of code above may also be written as the line shown below:

objOpenSTAAD.GetNodeDisplacements _
nNodeNo, nLC, pdDisps(0)
```

---

**OS. Getting Started with VB.Net**

This section will provide you with the information needed to set up an OpenSTAAD project written in VB.Net.

**Note:** While this doesn't assume that you have extensive VB.Net programming knowledge, it also is not intended to teach the VB.Net programming language. There are many excellent resources available to learn VB.Net, which is beyond the scope of the OpenSTAAD documentation.

**OS. Set Up Your Coding Environment**

In order to program OpenSTAAD in VB.Net, you will need to set up a development environment.

A development environment is typically a program that supports writing the code as well as a suite of tools to make that job easier. While computer code could be written in any plain text editor, an integrated development environment (IDE) will make the job much easier and more efficient. For this guide, you will use Microsoft Visual Studio.

**Note:** Microsoft has an excellent reference on getting started programming in C# at https://docs.microsoft.com/en-us/dotnet/visual-basic/getting-started/.

1. Download and install the Visual Studio IDE by checking the steps from https://docs.microsoft.com/en-us/visualstudio/install/install-visual-studio
2. Launch the Visual Studio 2019 application

**OS. Start Your VB.Net Project**

This quick set of steps demonstrates how to set up your workspace for a VB.Net project.
1. In the Visual Studio start window, click **Create a new project**. The **Create a new project** window opens.

2. Filter the project templates using the following:
   a. Type console in the search field.
   b. Select **VB** from the Language drop-down list.
   c. Select **Windows** from the Platform drop-down list.

3. Select the **Console App (.NET Framework)** from the results and then click **Next**. The **Configure your new project** window opens.

4. Type **OpenSTAAD Demo** in the **Project Name** field.

5. Click **Create**. Visual Studio opens your new project, which includes default "Hello World" code.

6. Add the **staadpro.dll** dependencies to the project file. This adds OpenSTAAD as a COM file reference.
   a. Open the project’s `.vbproj` file. This file is located in the root directory of the project.
   b. Add the following element to the start of the `<ItemGroup>` element:
      
      ```xml
      <COMFileReference Include="C:\Program Files\Bentley\Engineering\STAAD.Pro CONNECT Edition\STAAD\StaadPro.dll">
      <EmbedInteropTypes>True</EmbedInteropTypes>
      </COMFileReference>
      ```
   c. Save and close the project file.

### OS. Write an OpenSTAAD Program in VB.Net

This example will introduce you to several concepts necessary to writing OpenSTAAD applications in VB.Net. The example VB.Net project for Visual Studio 2019 can be downloaded [here](#).

### OS. Initiate OpenSTAAD in VB.Net

Note: You must have a model open in STAAD.Pro for this example. Otherwise your code will return an error.

1. Add a button in **Form1** and then add a click event to it.
2. Declare `mStaadObj` as an Object by typing: `Dim mStaadObj As Object`.
3. Type `mStaadObj = GetObject(, "StaadPro.OpenSTAAD")` and then press `<Return>`. This initiates OpenSTAAD and connects to the current STAAD.Pro model to your program.

Your program at this point should look like:

```vbnet
Public Class Form1
    Private Sub Button1_Click(sender As Object, e As EventArgs) Handles Button1.Click
        Dim mStaadObj As Object
        mStaadObj = GetObject(, "StaadPro.OpenSTAAD")
    End Sub
End Class
```
OS. Use Geometry Methods

1. After the mStaadObj declaration, type Dim nodesCount As Integer and then press <Return>.
   This dimensions the variable nodesCount as an integer.

2. Type Dim beamCount As Integer and then press <Return>.
   This dimensions the variable beamCount as an integer.

3. After the mStaadObj initiation, type nodesCount = mStaadObj.geometry.GetNodeCount() and then press <Return>.
   This uses the OpenSTAAD method GetNodeCount() to return the number of nodes in the active STAAD.Pro model into the specified variable.

4. Type beamCount = mStaadObj.geometry.GetMemberCount() and then press <Return>.
   Similarly, this uses the OpenSTAAD method GetMemberCount() to return the number of members in the active STAAD.Pro model into the specified variable.

Tip: Reference the OpenSTAAD documentation for details on available methods and what values are accepted as input or returned from each.

Your program at this point should look like:

```vbnet
Public Class Form1
    Private Sub Button1_Click(sender As Object, e As EventArgs) Handles Button1.Click
        Dim mStaadObj As Object
        Dim nodesCount As Integer
        Dim beamCount As Integer
        mStaadObj = GetObject(, "StaadPro.OpenSTAAD")
        nodesCount = mStaadObj.geometry.GetNodeCount()
        beamCount = mStaadObj.geometry.GetMemberCount()
    End Sub
End Class
```

OS. Generate OpenSTAAD Output

1. Type MsgBox(nodesCount, vbInformation, "No. of Nodes in the Model ") and then press <Return>.
   The numerical nodeCount value is added to a text string in a message box when the button is clicked.

2. Type MsgBox(beamCount, vbInformation, "No. of Members in the Model ").
   Similarly, the beamCount value is added to a text string in a message box when the button is clicked.

Your final program should look like:

```vbnet
Public Class Form1
    Private Sub Button1_Click(sender As Object, e As EventArgs) Handles Button1.Click
        Dim mStaadObj As Object
        Dim nodesCount As Integer
        Dim beamCount As Integer
        mStaadObj = GetObject(, "StaadPro.OpenSTAAD")
        nodesCount = mStaadObj.geometry.GetNodeCount()
        beamCount = mStaadObj.geometry.GetMemberCount()
    End Sub
End Class
```
```vbnet
MsgBox(nodesCount, vbInformation, "No. of Nodes in the Model ")
MsgBox(beamCount, vbInformation, "No. of Members in the Model ")
End Sub
End Class
```

OS. Run Your Code

You should now have a working piece of VB.Net code which will provide you information about the currently active STAAD.Pro model. You’ll now run the code to test it.

1. Save your progress by either:
   - selecting File > Save
   - pressing <Ctrl+S>

2. Press <Ctrl+F5> to run your project.
   The terminal will open and display the results.

It is best practice to annotate your code with comments. This allows others to easily understand what your code is doing (or at least what your intention was). The full example here contains comments accordingly.

OS. Troubleshooting

The following is a list of error messages or warnings which may be displayed and methods used to address them.

OS. Method Object Failed

Error message:
Method 'OpenSTAADFunctionName' of object IOutput failed.

where OpenSTAADFunctionName is the name of an OpenSTAAD function. For example:
Method 'GetMemberBetaAngle' of object IOutput failed.
**Solution**
Check to be sure that you are passing all parameters required by the function. If a parameter is missing, or if the parameter being passed is not valid, the Method …of object IOutput failed message may appear. For example, the message may appear if a member number is passed to the function, but that member number does not exist in the currently open STAAD file.

**OS. Function is not retrieving correct values**
Check to be sure that you have saved the STAAD file after making changes to the input before you run any OpenSTAAD functions that retrieve input information. If you are running STAAD functions that retrieve analysis results, check to be sure that you have saved the STAAD file and re-run the analysis after making any changes to the input.

**OS. Type Mismatch**
Error message:
Type mismatch
Check to make sure that you have declared all variables using the DIM statement at the beginning of your program or macro, e.g.:
```
Dim pnIsReleased As Integer
Dim pdSpringStiffnesses(0 To 5) As Double
Dim pdPartialMomRelFactors(0 To 2) As Double
```
Confirm that when you pass array variables to the function, you have specified the starting position in the array for the function to use in filling up the array. For example:
```
objOpenSTAAD.GetFullMemberReleaseInfoAtStar 3, pnIsReleased, _
pdSpringStiffnesses(0), pdPartialMomRelFactors(0)
```

**OS. Property or Method Not Supported**
Error message:
Object doesn't support this property or method
Check to make sure you have typed the function name correctly.

**OS. ActiveX Component in Microsoft® Excel**
Error message:
ActiveX component can't create object
when attempting to run an OpenSTAAD macro in Microsoft Excel.

**Are macros enabled?**
When you open the Excel file, is it asking you to Enable Macros?
If so, make sure you click **Yes**. If not, you need to change the security settings in Excel. Select **Tools > Macro > Security**... from the Excel menu. Make sure the **Security Level** is set to **Medium**. Close Excel down (completely, not just the file) and reopen the file again. This time it should ask you if you want your Macros enabled or disabled. Choose **Enabled**.

**OpenSTAAD DLL not registered**

When you run your macro, if it still gives you the error ("ActiveX component can’t create object"), it might be because the OpenSTAAD library was not registered properly when the program was installed.

**Register the DLL**

1. In Windows Explorer, go to the following location:
   
   `C:\Program Files\Bentley\Engineering\STAAD.Pro CONNECT Edition\STAAD\Plugins\StrucLink\`

   **Note:** The path to the file `OpenStaad.Registration.exe` may be different on your computer if you did not use the default installation path provided by the STAAD.Pro installer when you installed your software – if so, go to folder corresponding to the actual location on your computer.

3. Right-click on the file `OpenStaad.Registration.exe` and select **Run as Administrator** from the pop-up menu.

4. Click **Register OpenSTAADUI to register the DLL.**
   
   A message dialog opens indicating that the OpenSTAADUI type library is registered. If the registration did not succeed, please contact our technical support staff for further instructions.

5. Click **OK**.

6. Try opening and running the Microsoft Excel beam example file provided with your STAAD.Pro software (`C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\OpenSTAAD \Rectangle-beam.xls`).

7. Close all the STAAD.Pro instances and open only the relevant STAAD.Pro model.

8. Run the macro.

**OS. User Type Not Defined**

The message may be appearing because the OpenSTAAD library references have not been included. The VBA compiler therefore does not know which functions are associated with the OpenSTAAD object.

There are two ways to eliminate this error message:

1. Declare the OpenSTAAD object *As Object*, instead of *As Output*, e.g.

   ```vba
   Dim objOpenSTAAD As Object
   ```

2. Include the OpenSTAAD library reference in your VBA editor. This second option has the added benefit that once you do it, the compiler will now recognize the OpenSTAAD object and will pop up a list of functions whenever you refer to the object in your VBA editor.

To include the OpenSTAAD library reference, select **Tools > References** in your VBA editor. A dialog titled **References – Normal** opens. You will see a scroll box inside the dialog box labeled **Available References**. Scroll down through the list of references until you find and entry labeled **OpenSTAAD 1.0 Type Library.** Toggle on the corresponding check box, then click **OK**.
Now re-run your macro to see if the problem with the User Defined type not defined error message has been solved.

OS. Files Not Compatible

Error message:
One or more results files are not compatible with the current model and cannot be loaded...

You need to have a successful analysis before you can run any OpenSTAAD macro, including such simple macros as one that only asks for the number of nodes in the model. The program is not smart enough to know which commands will work and which will not when no results are present. It first checks to see if valid results are available. If they are not, it displays the error message and terminates.

You can use the OpenSTAAD command AreResultsAvailable in your macro to check to see if results are available. In some cases, this function also will result in the error message One or more results files are not compatible with the current model and cannot be loaded.... That means that even though the STAAD results file with an ANL extension has been created, the file contains only error messages and no meaningful results.

You can also try inserting a FINISH command in your input file preceding the location in the input that is causing the analysis errors. Depending on whether the errors take place before any analysis is performed, you might get rid of the original error message, but in its place you may see the message, No Results Available. However, the best way to eliminate this problem is to modify your input file so that you obtain a successful analysis before you try to run your OpenSTAAD macro.

Under certain conditions, you might get this ...results files are not compatible... error message, even though the analysis runs successfully. OpenSTAAD currently will not work with the Moving Load Generator. The reason is that the results from the Moving Load Generator are not kept in the same database as the other STAAD results. Therefore, when OpenSTAAD tries to read the Output File, it is not able to find those missing load results, so it displays an error message and stops processing the macro. This same situation is in effect for any other loads that you are unable to see until you perform the analysis, like UBC loads, for example. If the loads are defined in the input file, OpenSTAAD will work fine, but not with loads that are only generated when the analysis is run, because these results are not kept in a location where OpenSTAAD can find them.

If you remove your moving load generation command from your input file, and run the analysis, you should then be able to run your OpenSTAAD macro.

OS. Getting More Help with OpenSTAAD

The following resources can be of assistance as you use OpenSTAAD in your projects.

The Bentley Communities website is a great place to ask OpenSTAAD questions and get answers from Bentley experts and fellow users.

Caution: Code or files uploaded to Bentley Communities are not subject to a screening process in advance. Any files or code which are found to result in malicious behavior will be removed. Bentley Systems accepts no
responsibility for any mistake, error or misrepresentation in or as a result of the usage of software code obtained from the Bentley Communities site.
