V. GB 50011-2001 Static Seismic - Case2

Calculate the base shear and its distribution along the height using the equivalent lateral force method in GB 50011-2001 using an equivalent gravity load factor for horizontal seismic action of 1.0.

Details

Structure to be modelled:

- height = 3 x 4 m = 12 m
- plan dimension X = 4 m
- plan dimension Z = 5 m
Input parameters:

- Frequency of seismic event: Frequent
- Classification of seismic design: Group 2
- Seismic design intensity: 8
- Site class: II
- Period in the X direction: \( T = 0.467 \)s
- Equivalent gravity load factor for horizontal seismic action: 1.0
- Damping ratio, \( \zeta = 0.05 \) (default in STAAD.Pro)

The section of all members is HW300X300, and the seismic weight for each floor is assumed as 280 kN applied as joint weight of 70 kN to nodes 2, 3, 5, 6, 8, 9, and 11 to 16.

**Validation**

The effective weight of the structure:

\[
G_{\text{Eq}} = 1.0 \times 280 \text{ kN} \times 3 \text{ floors} = 840 \text{ kN}
\]
The max value of the horizontal seismic influence for a “frequent” earthquake with intensity of 8, $a_{max} = 0.16$ (Table 5.1.4-1)

The characteristic period, $T_g = 0.4s$ (Table 5.1.4-2)

The power index of the curvilinear decrease section:

$$y = 0.9 + \frac{0.05 \cdot \zeta}{0.5 + 5\zeta} = 0.9$$

The damping adjustment factor:

$$\eta_2 = 1 + \frac{0.05 \cdot \zeta}{0.06 + 1.7\zeta} = 1.0$$

$T_g < T < 5T_g$

The horizontal seismic influence coefficient corresponding to the fundamental period of the structure:

$$a_1 = \left(\frac{T_g}{T}\right)^\gamma \eta_2 \times a_{max} = \left(\frac{0.4}{0.467}\right)^0.9 \times 1.0 \times 0.16 = 0.139$$

The characteristic value of the total horizontal seismic action of the structure:

$$F_{Ek} = a_1 \times G_{Eq} = 0.139 \times 840 = 116.76 \text{ kN}$$

$$T = 0.467 < 1.4T_g = 0.56$$

Additional seismic action factors at the top of the building $\delta_n = 0$

Additional horizontal seismic action applied at top of the building $\Delta F_n = \delta_n \times F_{Ek} = 0$

Characteristic value of horizontal seismic action applied at the $i^{th}$ mass:

$$F_i = \frac{G_i H_i}{\sum_{j=1}^n G_j H_j} F_{Ek} (1 - \delta_n)$$

### V. GB 50011-2010 Static Seismic - Case1

Calculate the base shear and its distribution along the height using the equivalent lateral force method in GB 50011-2010.

#### Details

Structure to be modelled:

- height = 3\(\times\) 4m = 12m
- plan dimension X = 4m
- plan dimension Z = 5m
Input parameters:

- Frequency of seismic event: Frequent
- Classification of seismic design: Group 2
- Seismic design intensity: 8
- Site class: II
- Equivalent gravity load factor for horizontal seismic action: 0.85 (default in STAAD.Pro)
- Damping ratio, $\zeta = 0.05$ (default in STAAD.Pro)

The section of all members is HW300X300, and the seismic weight for each floor is assumed as 280 kN applied as joint weight of 70 kN to nodes 2, 3, 5, 6, 8, 9, and 11 to 16.

**Validation**

The effective weight of the structure:

$$G_{eq} = 0.85 \times 280 \text{ kN} \times 3 \text{ floors} = 714 \text{ kN}$$

The structure period (as calculated by STAAD.Pro, $T_{calc} = 0.685s$)

$\text{STAAD.Pro}$ 3366 $\text{User Manual}$
The max value of the horizontal seismic influence for a “frequent” earthquake with intensity of 8, $a_{\text{max}} = 0.16$ (Table 5.1.4-1)

The characteristic period, $T_g = 0.4s$ (Table 5.1.4-2)

The power index of the curvilinear decrease section:

$$y = 0.9 + \frac{0.05 \cdot \zeta}{0.5 + 5\zeta} = 0.9$$

The damping adjustment factor:

$$\eta_2 = 1 + \frac{0.05 \cdot \zeta}{0.06 + 1.7\zeta} = 1.0$$

$T_g < T < 5T_g$

The horizontal seismic influence coefficient corresponding to the fundamental period of the structure:

$$a_1 = \left(\frac{T_g}{T}\right)^\gamma \eta_2 \times a_{\text{max}} = \left(\frac{0.4}{0.685}\right)^{0.9} 1.0 \times 0.16 = 0.099$$

The characteristic value of the total horizontal seismic action of the structure:

$$F_{E_k} = a_1 \times G_{\text{Eq}} = 0.099 \times 714 = 70.69 \text{ kN}$$

$T = 0.685 > 1.4T_g = 0.56$

$T = 0.35 < T_g < 0.55$

Additional seismic action factors at the top of the building $\delta_n = 0.08\times T + 0.01 = 0.065$

Additional horizontal seismic action applied at top of the building $\Delta F_n = \delta_n \times F_{E_k} = 0.065 \times 70.69 = 4.59 \text{ kN}$

Characteristic value of horizontal seismic action applied at the $i^{th}$ mass:

$$F_i = \frac{G_i H_i}{\sum_{j=1}^n G_j H_j} F_{E_k} (1 - \delta_n)$$

V. GB 50011-2010 Static Seismic - Case2

Calculate the base shear and its distribution along the height using the equivalent lateral force method in GB 50011-2010.

Details

Structure to be modelled:

- height = 3× 4m = 12m
- plan dimension X = 4m
- plan dimension Z = 5m
Input parameters:

- Frequency of seismic event: Rare
- Classification of seismic design: Group 3
- Seismic design intensity: 6
- Site class: I0
- Period in the X direction: $T = 0.40s$
- Equivalent gravity load factor for horizontal seismic action: 0.85 (default in STAAD.Pro)
- Damping ratio, $\zeta = 0.05$ (default in STAAD.Pro)

The section of all members is HW300X300, and the seismic weight for each floor is assumed as 280 kN applied as joint weight of 70 kN to nodes 2, 3, 5, 6, 8, 9, and 11 to 16.

**Validation**

The effective weight of the structure:

$$G_{\text{Eq}} = 0.85 \times 280 \text{ kN} \times 3 \text{ floors} = 714 \text{ kN}$$
The max value of the horizontal seismic influence for a “rare” earthquake with intensity of 6, $a_{\text{max}} = 0.28$ (Table 5.1.4-1).

The characteristic period, $T_g = 0.30 + 0.05 = 0.35s$ (Table 5.1.4-2).

The power index of the curvilinear decrease section:
$$y = 0.9 + \frac{0.05 \cdot \zeta}{0.5 + 5\zeta} = 0.9$$

The damping adjustment factor:
$$\eta_2 = 1 + \frac{0.05 \cdot \zeta}{0.06 + 1.7\zeta} = 1.0$$

$$T_g < T < 5T_g$$

The horizontal seismic influence coefficient corresponding to the fundamental period of the structure:
$$a_1 = \left(\frac{T_g}{T}\right)^y \eta_2 \times a_{\text{max}} = \left(\frac{0.35}{0.4}\right)^0.9 \times 1.0 \times 0.28 = 0.248$$

The characteristic value of the total horizontal seismic action of the structure:
$$F_{\text{Ek}} = a_1 \times G_{\text{Eq}} = 0.248 \times 714 = 177.28 \text{ kN}$$ (Eq. 2.5)

Additional seismic action factors at the top of the building $\delta_n = 0$

Additional horizontal seismic action applied at top of the building $\Delta F_n = \delta_n \times F_{\text{Ek}} = 0$

Characteristic value of horizontal seismic action applied at the $i^{th}$ mass:
$$F_i = \frac{G_i H_i}{\sum_{j=1}^{n} G_j H_j} F_{\text{Ek}} (1 - \delta_n)$$

#### V. IBC / ASCE 7

##### V. ASCE 7 Geometric Irregularity

Verify geometric irregularity (reentrant corners in plan) check in accordance to the ASCE 7-16 specifications.

**Details**

A two story structure is modelled with diaphragms at the story levels.
Figure 415: Isometric View
Seismic parameters:

- Zip code = 92887
- Importance factor, I = 1.0
- Response reduction factor in X, Rx = 3
- Response reduction factor in Z, Rz = 4
- Site class A
- Long period, TL = 8 sec

Verification

Both diaphragms have the same dimensions and are doubly-symmetric. The overall building width in either direction is 12 m and the potential reentrant corner sides are 4 m. Therefore, the ratio of the $A/L = 4 \text{ m} / 12 \text{ m} = 0.333 > 0.15$.

Thus, each of the four corners are reentrant corners per the ASCE 7-16 code.

**V. ASCE 7 Torsion Irregularity**

Verify the torsional irregularity check per the ASCE 7-16 specifications.

**Details**

A three story building is modelled with floor diaphragms defined at each floor level.

A 1 kip (4.4482 kN) load is applied to each diaphragm in both the global X and Z directions. In STAAD.Pro, this is modelled using an analytical node in each diaphragm. This is used to obtain the displacements in the nodes of the diaphragm.
Nodes 17, 18, and 19 are the control nodes in each diaphragm.

Validation
The displacements induced because of the applied loads on the control nodes for the nodes situated on the extremities of each diaphragm is taken from the STAAD.Pro output for each lateral direction.

V.IBC 2018 Static Seismic T 1.2

Verify the program-calculated base shear and its distribution along the height of a three-story frame by using the equivalent lateral force method per IBC 2018. Also, verify the torsional moments to which the floors are subjected to, considering inherent as well as accidental torsion.

Details

A three-story structure is subject to a seismic load from the +X direction.
Assumptions

i. Mapped MCER spectral response acceleration parameter at short period, $S_s = 2.02$

ii. Mapped MCER spectral response acceleration parameter at a period of 1 s, $S_1 = 0.795$

iii. Risk Category – I (Hence, From Table 1.5-2, Importance Factor $I = 1$)

iv. Site Class – D (SCLASS 4)

v. Response Modification Factor ($RX$ & $RZ$) = 3

vi. Long-period Transition Time ($TL$) = 12 s

vii. Seismic weight is composed of UDLs (magnitude -5 kN/m, direction GY) (defined in Reference Load Definition), incident on the beams

viii. Time Period of the Structure in both directions ($PX$ & $PZ$) = 1.2 s

ix. Time period coefficients, $CTX = CTZ = 0.28$

x. Exponents in time period equation: $XX = XZ = 1$

xi. The effect of shear deformation is neglected

Validation

Calculation of Base Shear

Based on $S_s$ and $S_1$, $F_a = 1$ (per table 11.4-1) and $F_v = 1.7$ (per table 11.4-2).

Hence:

$$S_{MS} = F_a \times S_s = 1 \times 2.02 = 2.02$$

$$S_{DS} = 2/3 \times S_{MS} = 1.347$$
\[ S_{M1} = F_v \times S_1 = 1.7 \times 0.795 = 1.382 \quad \text{Eq. 11.4-3} \]

\[ S_{D1} = 2/3 \times S_{M1} = 0.901 \quad \text{Eq. 11.4-4} \]

\[ (C_s)_{\text{initial}} = \frac{S_{DS}}{R/T} = 0.4489 \quad \text{Eq. 12.8-2} \]

The natural period of the structure, \( T_N = 1.2 \text{ s} \) (TX 1.2, provides as user input).

Height of the structure, \( h = 9 \text{ m} \).

So the approximate time period, \( T_a = C_t \times h = 0.28(9\text{m})^{1.0} = 2.52 \text{ s} \)

From Table 12.8-1, \( C_u = 1.4 \) (for \( S_{D1} > 0.4 \)).

\[ C_u \times T_a = 3.528 \text{ s} \]

The time period used, \( T_R \), is the lesser of \( T_N \) and \( C_u \times T_a \), which is \( 1.2 \text{ s} \) (< \( T_L = 12 \text{ s} \)).

\[ (C_s)_{\text{max}} = \frac{S_{D1}}{T \times (R/T)} = 0.25028 \quad \text{Eq. 12.8-3} \]

\[ (C_s)_{\text{min1}} = 0.044 \times S_{DS} \times I = 0.059 \quad \text{Eq. 12.8-5} \]

Since \( S_1 = 0.795 > 0.6g \), equation 12.8-6 also needs to be considered for calculating the lower limit of \( C_s \) :

\[ (C_s)_{\text{min2}} = \frac{0.5 \times S_1}{R/I} = 0.1325 \quad \text{Eq. 12.8-6} \]

Therefore, \( (C_s)_{\text{min}} = 0.1325 < C_s \).

\[ C_s = 1.5 \times 0.2503 = 0.3754 \]

The seismic weight, \( W \) is taken as the total seismic weight of the beams: \( 5 \times 3 \times 69 = 1,035 \text{ kN} \)

So the total base shear, \( V = C_s \times W = 0.3754 \times 1,035 = 388.56 \text{ kN} \)

**Vertical Distribution of Lateral Forces**

Since, time period of the structure \( T = 1.2 \text{ s} > 0.5 \text{ s} \) and \( T < 2.5 \text{ s} \), as per clause 12.8.3, value of \( k \) needs to be linearly interpolated.

\[ k = 1.35 \]

Hence, from equation 12.8-11 and equation 12.8-12, we can find the lateral forces in different story levels, as follows:

**Table 453: Vertical force distribution**

<table>
<thead>
<tr>
<th>Story Level</th>
<th>( W_x ) (kN)</th>
<th>( h_x ) (m)</th>
<th>( W_x \times h_x^k )</th>
<th>( \frac{\sum_{i=1}^{3} (W_i \times h_i^k)}{3} )</th>
<th>Lateral force at story level (kN)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roof</td>
<td>5 \times 3 \times 23 = 345</td>
<td>9</td>

<td>1</td>
<td>388.56</td>
</tr>
</tbody>
</table>
Consideration of Inherent Torsion (Clause 12.8.4.1)

Floor Level – Roof (9 m)
From output file, CRZ = 3.831 m and CMZ = 3.848 m
Hence, static eccentricity esi = CMZ - CRZ = 0.017 m

Floor Level – 2nd (6 m)
From output file, CRZ = 3.858 m and CMZ = 3.848 m
Hence, static eccentricity esi = CMZ - CRZ = -0.01 m

Floor Level – 1st (3 m)
From output file, CRZ = 3.902 m and CMZ = 3.848 m
Hence, static eccentricity esi = CMZ - CRZ = -0.054 m

Consideration of Accidental Torsion (Clause 12.8.4.2)

At all floor levels:

\[0.05 \times L_z = 0.05 \times 9m = 0.45 \text{ m}\]

where

\[L_z\] = the dimension of the structure along the global Z axis

Hence, total eccentricity to inherent and accidental torsion at roof level \(e_r = (0.45 + 0.017) = 0.467 \text{ m}\)
Total eccentricity to inherent and accidental torsion at 2nd floor level \(e_2 = (0.45 - 0.01) = 0.44 \text{ m}\)
Total eccentricity to inherent and accidental torsion at 1st floor level \(e_1 = (0.45 - 0.054) = 0.396 \text{ m}\)

Total torsional moment at roof level \(= F_{\text{roof}} \times e_r = 215.20 \times 0.467 = 100.51 \text{ kN} \cdot \text{m}\)
Total torsional moment at 2nd floor level \(= F_{\text{2nd}} \times e_2 = 124.50 \times 0.440 = 54.779 \text{ kN} \cdot \text{m}\)
Total torsional moment at 1st floor level \(= F_{\text{1st}} \times e_1 = 48.84 \times 0.396 = 12.893 \text{ kN} \cdot \text{m}\)

**V. IBC 2018 Static Seismic T Greater Than 2.5**

Verify the program-calculated base shear and its distribution along the height of a 22-story frame by using equivalent lateral force method as per IBC 2018. Also, verify the torsional moments to which the floors are subjected to, considering inherent as well as accidental torsion.

**Details**

A 22-story structure is subject to a seismic load from the +X direction (see following figure). Each story is 10' in height (total building height of 220'). The column bases are assumed fixed. The time period of the structure uses is its Rayleigh frequency.

![Plan View](image)

**Assumptions**

i. Mapped MCER spectral response acceleration parameter at short period, $S_s = 1.5$

ii. Mapped MCER spectral response acceleration parameter at a period of 1 s, $S_I = 0.5$

iii. Risk Category – I (Hence, From Table 1.5-2, Importance Factor I = 1)

iv. Site Class – D (SCLASS 4)

v. Response Modification Factor (RX & RZ) = 3

vi. Long-period Transition Time (TL) = 12 s

vii. Seismic weight is composed of UDLs (magnitude -22.481 kip/ft, direction GY) (defined in Reference Load Definition), incident on the beams

viii. The effect of shear deformation is neglected
Validation

Calculation of Base Shear

Based on $S_s$ and $S_1$, $F_a = 1$ (per table 11.4-1) and $F_v = 1.8$ (per table 11.4-2).
Hence:

$$S_{MS} = F_a \times S_s = 1 \times 1.5 = 1.5 \quad \text{Eq. 11.4-1}$$
$$S_{DS} = 2/3 \times S_{MS} = 1.0 \quad \text{Eq. 11.4-3}$$
$$S_{M1} = F_v \times S_1 = 1.8 \times 0.5 = 0.9 \quad \text{Eq. 11.4-3}$$
$$S_{D1} = 2/3 \times S_{M1} = 0.60 \quad \text{Eq. 11.4-4}$$

$$\left(C_s\right)_{\text{initial}} = \frac{S_{DS}}{R/T} = 0.333 \quad \text{Eq. 12.8-2}$$

The time period of the structure is taken as the Rayleigh frequency of the structure (taken from the output file), $T_R = 18.12$ s.

Height of the structure, $h = 220$ ft.

For steel moment-resisting frames, $C_t = 0.028$ and $x = 0.8$ (per Table 12.8-2).

So the approximate time period, $T_a = C_t \times h^x = 0.028(220 \text{ ft})^{0.8} = 2.0946$ s

From Table 12.8-1, $C_u = 1.4$ (for $S_{D1} > 0.4$).

$$C_u \times T_a = 2.9324 \text{ s}$$

The time period used, $T$, is the lesser of $T_R$ and $C_u \times T_a$, which is $2.9324$ s ($< T_L = 12$ s).

$$\left(C_s\right)_{\text{max}} = \frac{S_{D1}}{T \times (R/T)} = 0.0682 \quad \text{Eq. 12.8-3}$$

$$\left(C_s\right)_{\text{min1}} = 0.044 \times S_{DS} \times I = 0.044 \quad \text{Eq. 12.8-5}$$

Since $S_1 = 0.5 < 0.6g$, equation 12.8-6 does not need to be considered for calculating the lower limit of $C_s$.

Therefore, $C_s = 1.5 \times 0.0682 = 0.1023$ [Clause 11.4.8, ii].

The seismic weight, $W$ is taken as the total seismic weight of the beams: $= 396 \times 22.481 \times 10 = 89,025$ kip

So the total base shear, $V = C_s \times W = 0.1023 \times 89,025 = 9,108$ kip

Vertical Distribution of Lateral Forces

Since, time period of the structure $T > 2.5$ s, as per clause 12.8.3, $k = 2$.

Hence, from equation 12.8-11 and equation 12.8-12, we can find the lateral forces in different story levels, as follows:

**Table 455: Vertical force distribution**

Consideration of Inherent and Accidental Torsion (as per Clause 12.8.4.1 and 12.8.4.2)

From the output, we can find the Center of Mass and Center of Rigidity values for different story of the structure, numerical difference between the two gives us the static eccentricity. For dynamic eccentricity calculation, the...
static eccentricity values are to be multiplied with a factor \((\text{DEC} - 1)\) (DEC being the dynamic eccentricity factor, provided in the seismic load item in the model = 2), so \((\text{DEC}-1) = 1\). For accidental eccentricity, the multiplying factor \(\text{ACC}\) (ACC being the multiplication factor for Accidental Torsional Moment, provided in the seismic load item in the model = 0.05). These two eccentricities add up to give the total eccentricity due to inherent as well as accidental torsion. This eccentricity multiplied by the Lateral Force in a particular story level, gives the total torsional moment in that level. Calculations show the results to be:

<table>

- [TR.31.2.17 IBC 2018 Seismic Load Definition](on page 2391)

V.IBC 2018 Static Seismic T Less Than 0.5

Verify the program-calculated base shear and its distribution along the height of a three-story frame by using the equivalent lateral force method per IBC 2018. Also, verify the torsional moments to which the floors are subjected to, considering inherent as well as accidental torsion.

Details

A three-story structure is subject to a seismic load from the +X direction. The time period of the structure used is its calculated Rayleigh frequency (taken from STAAD.Pro output).
Assumptions

i. Mapped MCER spectral response acceleration parameter at short period, $S_s = 2.02$

ii. Mapped MCER spectral response acceleration parameter at a period of 1 s, $S_1 = 0.795$

iii. Risk Category – I (Hence, From Table 1.5-2, Importance Factor I = 1)

iv. Site Class – D (SCLASS 4)

v. Response Modification Factor ($R_X$ & $R_Z$) = 3

vi. Long-period Transition Time (TL) = 12 s

vii. Seismic weight is composed of UDLs (magnitude -5 kN/m, direction GY) (defined in Reference Load Definition), incident on the beams

viii. The effect of shear deformation is neglected

Validation

Calculation of Base Shear

Based on $S_s$ and $S_1$, $F_a = 1$ (per table 11.4-1) and $F_v = 1.7$ (per table 11.4-2).

Hence:

$$S_{MS} = F_a \times S_s = 1 \times 2.02 = 2.02$$  \hspace{2cm} \text{Eq. 11.4-1}

$$S_{DS} = 2/3 \times S_{MS} = 1.347$$  \hspace{2cm} \text{Eq. 11.4-3}

$$S_{M1} = F_v \times S_1 = 1.7 \times 0.795 = 1.382$$  \hspace{2cm} \text{Eq. 11.4-3}

$$S_{D1} = 2/3 \times S_{M1} = 0.901$$  \hspace{2cm} \text{Eq. 11.4-4}
The seismic weight, \( W \) is taken as the total seismic weight of the beams: \( W = 5 \times 3 \times 69 = 1,035 \text{ kN} \)

So the total base shear, \( V = C_s \times W = 0.4489 \times 1,035 = 464.6 \text{ kN} \)

Vertical Distribution of Lateral Forces

Since, time period of the structure \( T = 0.201 \text{ s} < 0.5 \text{ s} \), as per clause 12.8.3, \( k = 1 \).

Hence, from equation 12.8-11 and equation 12.8-12, we can find the lateral forces in different story levels, as follows:

**Table 457: Vertical force distribution**

<table>
<thead>
<tr>
<th>Story Level</th>
<th>( W_x ) (kN)</th>
<th>( h_x ) (m)</th>
<th>( W_x \times h_x^k )</th>
<th>( \frac{\sum \limits_{i=1}^{3} (W_i \times h_i^k)}{3} )</th>
<th>Lateral force at story level (kN)</th>
</tr>
</thead>

</tbody>
</table>

Consideration of Inherent Torsion (Clause 12.8.4.1)

Floor Level – Roof (9 m)
From output file, CRZ = 3.831 m and CMZ = 3.848 m
Hence, static eccentricity esi = CMZ - CRZ = 0.017 m
Floor Level – 2nd (6 m)
From output file, CRZ = 3.858 m and CMZ = 3.848 m
Hence, static eccentricity esi = CMZ - CRZ = -0.01 m
Floor Level – 1st (3 m)
From output file, CRZ = 3.902 m and CMZ = 3.848 m
Hence, static eccentricity esi = CMZ - CRZ = -0.054 m

Consideration of Accidental Torsion (Clause 12.8.4.2)
At all floor levels:

\[0.05 \times L_z = 0.05 \times 9m = 0.45 m\]

where \(L_z\) is the dimension of the structure along the global Z axis
Hence, total eccentricity to inherent and accidental torsion at roof level \(e_r = (0.45 + 0.017) = 0.467 m\)
Total eccentricity to inherent and accidental torsion at 2nd floor level \(e_2 = (0.45 - 0.01) = 0.44 m\)
Total eccentricity to inherent and accidental torsion at 1st floor level \(e_1 = (0.45 - 0.054) = 0.396 m\)
Total torsional moment at roof level = \(F_{roof} \times e_r = 232.3 \times 0.467 = 108.48 kN\cdot m\)
Total Torsional moment at 2nd floor level = \(F_{2nd} \times e_2 = 154.867 \times 0.44 = 68.141 kN\cdot m\)
Total torsional moment at 1st floor level = \(F_{1st} \times e_1 = 77.433 \times 0.396 = 30.664 kN\cdot m\)

### V. IBC 2018 Response Spectrum

Details

A three story building is modelled in STAAD.Pro considering the following:

- Location: Corona, CA (ZIP 92887)
- Short period acceleration, $S_s = 1.996$
- One second acceleration: $S_l = 0.7$
- Site class A
- Response modification factor, $R = 3$
- Importance factor, $I = 1.0$
- $F_a = 0.8$
- $F_v = 0.8$
- $TL = 8$

The generated model is subjected to a Response Spectrum Load along global X direction. The base shear reported by STAAD.Pro is verified against hand calculation.

### V. IBC 2015 Static Seismic

Calculation of base shear and its distribution along the height for equivalent lateral force method in IBC 2015.

#### Problem

Structure to be modelled:

- Height = 4×4m = 16m
- Plan dimension X = 4m
- Plan dimension Z = 5m
Input parameters:

Location: Corona, CA, USA (ZIP 92877)
Site class D (SCLASS 4)
Long-period transition time = 12s (TL 12)
Importance factor = 1.0 (I 1.0)
Response modification factor X = 3 (RX 3)
Response modification factor Z = 4 (RZ 4)

The seismic weight for each floor is assumed as 200 KN applied as joint weight of 50KN to nodes 2 3 5 6 8 9 11 To 20. Seismic Load as per IBC 2015 specifications are generated along horizontal direction global X. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.

Calculations

ZIP = 92887; Ss = 2.247 & S1 = 0.817
For Site Class D, Fa = 1 (Ss > 1.25) and Fv = 1.5 (S1 > 0.5)
Verification Examples
V.06 Loading

\[ SMS = S_s \times F_a = 2.247, \quad SM1 = S_1 \times F_v = 1.2255 \]
\[ SDS = \frac{2}{3} \times SMS = 1.498, \quad SD1 = \frac{2}{3} \times SM1 = 0.817 \]

For concrete moment resisting frames \( Ct = 0.0466 \) in metric system & \( x = 0.9 \)

\[ \text{Height} = ha = 16m, \quad Ta = Ct \times ha^x = 0.0466 \times 16^{0.9} = 0.565, \]

Since \( SD1 > 0.4, \quad Cu = 1.4 \)
\[ Cu \times Ta = 1.4 \times 0.565 = 0.791 \]

\( T \) (from output file) = 1.286, \( Cu \times Ta = 0.791 < 1.286, \quad T_{used} = 0.791 \)

\[ Cs_x = SDS/(Rx/I) = 1.498 / (3/1) = 0.49933 \]

\[ Cs_x \text{ lower limit} = 0.044 \times SDS \times I & 0.5 \times S1 / (Rx/I), \]

\[ Cs_x \text{ lower limit} = 0.044 \times 1.498 \times 1 & 0.5 \times 0.817 / (3/1) \]

\[ Cs_x \text{ lower limit} = 0.065912 & 0.136166 \]

\[ Cs_x \text{ upper limit} = SD1 / (T_{used} \times (Rx/I)) \text{ as } T_{used} < TL \]

\[ Cs_x \text{ upper limit} = 0.817 / (0.791 \times (3/1)) = 0.34429 \]

\( Cs_x \text{ used} = 0.34429 \)

Seismic Base Shear \( V = Cs \times W = 0.34429 \times (200 \times 4) = 275.432 \) KN

Lateral seismic force \( F_x = C_{vx} \times V \) where \( C_{vx} = W_x \times h_x^k / \sum W_i \times h_i^k \)

Since \( T_{used} = 0.791 \text{ sec} > 0.5 \text{ Sec} \) distribution of Base Shear along story levels would have the value of exponent \( k \) linearly interpolated between 1 (less than equal to 0.5 sec) and 2 (greater than equal to 2.5 sec) i.e. power = 1.1455.

V. IBC 2012 Response Spectrum

Details

A three story building is modelled in STAAD.Pro considering the following:

- Location: Corona, CA (ZIP 92887)
- Short period acceleration, $S_s = 2.24658$
- One second acceleration: $S_t = 0.817039$
- Site class E
- Response modification factor, $R = 3$
- Importance factor, $I = 1.0$
- $F_a = 0.9$
- $F_v = 2.4$
- $TL = 8$

The generated model is subjected to a Response Spectrum Load along global X direction. The base shear reported by STAAD.Pro is verified against hand calculation.

**V. IBC 2012 Static Seismic**

Calculation of base shear and its distribution along the height for equivalent lateral force method in IBC 2012.

**Problem**

Structure to be modelled:

- height = 4× 4m = 16m
- plan dimension X = 4m
- plan dimension Z = 5m
Input parameters:

Location: Corona, CA, USA (ZIP 92877)
Site class D (SCLASS 4)
Long-period transition time = 12s (TL 12)
Importance factor = 1.0 (I 1.0)
Response modification factor X = 3 (RX 3)
Response modification factor Z = 4 (RZ 4)

The seismic weight for each floor is assumed as 200 kN applied as joint weight of 50kN to nodes 2 3 5 6 8 9 11 To 20. Seismic Load as per IBC 2012 specifications are generated along horizontal direction global X. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.

Calculations

ZIP = 92887; $S_s = 2.247$ & $S_1 = 0.817$

For Site Class D, $F_d = 1$ ($S_s > 1.25$) and $F_v = 1.5$ ($S_1 > 0.5$)
SMS = S_s × F_a = 2.247, SM1 = S_1 × F_v = 1.2255
SDS = 2/3 × SMS = 1.498, SD1 = 2/3 × SM1 = 0.817
For concrete moment resisting frames Ct = 0.0466 in metric system & x = 0.9
Height = ha = 16m, Ta = Ct × ha^x = 0.0466 × 16^0.9 = 0.565,
Since SD1 = 0.817 > 0.4, Cu = 1.4
Cu × Ta = 1.4 × 0.565 = 0.791
T (from output file) = 1.286, Cu × Ta = 0.791 < 1.286, T_{used} = 0.791
Cs_x = SDS/(Rx/I) = 1.498 / (3/1) = 0.49933
Cs_x lower limit = 0.044 × SDS × l & 0.5 × S1 / (Rx/I),
Cs_x lower limit = 0.044 × 1.498 × 1 & 0.5 × 0.817 / (3/1)
Cs_x lower limit = 0.065912 & 0.136166
Cs_x upper limit = SD1 / (T_{used} × (Rx/I)) as T_{used} < TL
Cs_x upper limit = 0.817 / (0.791 × (3/1)) = 0.34429
Cs_x used = 0.34429
Seismic Base Shear V = Cs × W = 0.34429 × (200 × 4) = 275.432 kN
Lateral seismic force Fx = C_v × V where C_v = W × h x^k / ∑(Wi × hi)^k
Since T_{used} = 0.791 sec > 0.5 Sec distribution of Base Shear along story levels would have the value of exponent k linearly interpolated between 1 (less than equal to 0.5 sec) and 2 (greater than equal to 2.5 sec) i.e. power = 1.1455.

V. IBC 2006 Response Spectrum

Details

A three story building is modeled in STAAD.Pro considering the following:

- Location: Corona, CA (ZIP 92887)
- Short period acceleration, $S_s = 1.8157$
- One second acceleration: $S_I = 0.67269$
- Site class D
- Response modification factor, $R = 3$
- Importance factor, $I = 1.0$
- $F_a = 1.0$
- $F_v = 1.5$
- $TL = 12$

The generated model is subjected to a Response Spectrum Load along global X direction. The base shear reported by STAAD.Pro is verified against hand calculation.

V. IBC 2006 Static Seismic

Calculation of base shear and its distribution along the height for equivalent lateral force method in IBC 2006.

Problem

Structure to be modelled:

height = 4 × 4 m = 16 m
plan dimension X = 4 m
plan dimension Z = 5 m
Input parameters:

- Location: Corona, CA, USA (ZIP 92877)
- Site class D (SCLASS 4)
- Long-period transition time = 12s (TL 12)
- Importance factor = 1.0 (I 1.0)
- Response modification factor X = 3 (RX 3)
- Response modification factor Z = 4 (RZ 4)

The seismic weight for each floor is assumed as 200 kN applied as joint weight of 50kN to nodes 2 3 5 6 8 9 11 To 20. Seismic Load as per IBC 2006 specifications are generated along horizontal direction global X. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.

Calculations

ZIP = 92887; Ss = 2.247 & S1 = 0.817

For Site Class D, Fa = 1 (Ss > 1.25) and Fv = 1.5 (S1 > 0.5)
**SMS = Ss × Fa = 2.247, SM1 = S1 × Fv = 1.2255**

**SDS = 2/3 × SMS = 1.498, SD1 = 2/3 × SM1 = 0.817**

For concrete moment resisting frames Ct = 0.0466 in metric system & x = 0.9

Height = hn = 16m = 52.49 ft, Ta = C_T × hn^x = 0.016 × 52.49^{0.9} = 0.565,

Since S_D1 = 0.673 > 0.4, Cu = 1.4

Cu × Ta = 1.4 × 0.565 = 0.791

T (from output file) = 1.286, Cu × Ta = 0.791 < 1.286, T_used = 0.791

Cs_x = S_DS/(Rx/I) = 1.21067 / (3/1) = 0.404

\[ C_s_x, \text{ lower limit} = \max \left( \frac{0.5 \times S_1}{R_x/I} \right) = \frac{0.5 \times 0.673}{3/1} = 0.112 \]

Cs_x upper limit = S_D1 / (T_used × (Rx/I)) = 0.673 / (0.791 × (3/1)) = 0.2835

Cs_x used = 0.2835

Seismic Base Shear \( V = C_s × W = 0.2835 × (200 × 4) = 226.8 \text{ kN} \)

Lateral seismic force \( F_x = C_{ux} × V \)

where

\[ C_{ux} = \frac{W_x × h_x^k}{\sum W_i × h_i^k} \]

Since \( T_{used} = 0.791 \text{ sec} > 0.5 \text{ Sec} \) distribution of base shear along story levels would have the value of exponent k linearly interpolated between 1 (less than equal to 0.5 sec) and 2 (greater than equal to 2.5 sec) i.e. \( k = 1.1455 \).

V. IBC 2003 Static Seismic

Calculation of base shear and its distribution along the height for equivalent lateral force method in IBC 2003.

Problem

Structure to be modelled:
height = 4× 4m = 16m
plan dimension X = 4m
plan dimension Z = 5m

Input parameters:

- Short period acceleration, \( S_{DS} = 1.21067 \) (SDS 1.21067)
- 1-Second period acceleration, \( S_{D1} = 0.673 \) (SD1 0.673)
- Site class D (SCLASS 4)
- Importance factor = 1.0 (I 1.0)
- Response modification factor \( X = 3 \) (RX 3)

The seismic weight for each floor is assumed as 200 kN applied as joint weight of 50kN to nodes 2 3 5 6 8 9 11 To 20. Seismic Load as per IBC 2003 specifications are generated along horizontal direction global X. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.
Calculations

For concrete moment-resisting frames, $C_T = 0.016$ and $x = 0.9$.

Height = $hn = 16m = 52.49$ ft, $Ta = C_T \times hn^x = 0.016 \times 52.49^{0.9} = 0.565$,

Since $S_{D1} = 0.673 > 0.4$, $Cu = 1.4$

$Cu \times Ta = 1.4 \times 0.565 = 0.791$

$T$ (from output file) = 1.286, $Cu \times Ta = 0.791 < 1.286$, $T_{used} = 0.791$

$C_s = S_{DS} / (R_x / I) = 1.21067 / (3/1) = 0.404$

$C_s$ lower limit $= \frac{0.044 \times S_{DS} \times I}{0.5 \times S_1} = \frac{0.044 \times 1.21067 \times 1}{0.5 \times 0.673} = 0.112$

$C_s$ upper limit $= S_{D1} / (T_{used} \times (R_x / I)) = 0.673 / (0.791 \times (3/1)) = 0.2835$

$C_s$ used = 0.2835

Seismic Base Shear $V = C_s \times W = 0.2835 \times (200 \times 4) = 226.8$ kN

Lateral seismic force $F_x = C_{ex} \times V$

where

$$C_{ex} = \frac{W_x \times h_x^k}{\sum W_i \times h_i^k}$$

Since $T_{used} = 0.791$ sec $> 0.5$ Sec distribution of base shear along story levels would have the value of exponent $k$ linearly interpolated between 1 (less than equal to 0.5 sec) and 2 (greater than equal to 2.5 sec) i.e. $k = 1.1457$.

V. IBC 2000 Static Seismic

Calculation of base shear and its distribution along the height for equivalent lateral force method in IBC 2000.

Problem

Structure to be modelled:

height = 4 × 4m = 16m
plan dimension X = 4m
Verification Examples
V.06 Loading

plan dimension Z = 5m

Input parameters:

Short period acceleration, $S_{DS} = 0.06$ ($S_{DS} \ 0.06$)
1-Second period acceleration, $S_{D1} = 1.36$ ($S_{D1} \ 1.36$)
Site class D ($SCLASS\ 4$)
Building period coefficient = 0.073 ($CT\ 0.073$)
Importance factor = 1.0 ($I\ 1.0$)
Response modification factor X = 3 ($RX\ 3$)

The seismic weight for each floor is assumed as 200 kN applied as joint weight of 50kN to nodes 2 3 5 6 8 9 11 To 20. Seismic Load as per IBC 2000 specifications are generated along horizontal direction global X. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.
Calculations

Height = \( hn = 16m, Ta = C_T \times hn = 0.073 \times 16^{0.75} = 0.584, \)

Since \( S_{D1} = 1.36 > 0.4, Cu = 1.2 \)

\( Cu \times Ta = 1.2 \times 0.584 = 0.701 \)

\( T \) (from output file) = 1.286, \( Cu \times Ta = 0.701 < 1.286, T_{used} = 0.701 \)

\[ Cs_x = S_{DS}/(R_x/I) = 0.06 / (3/1) = 0.02 \]

\[ Cs_x \text{ lower limit} = \max \left\{ 0.044 \times S_{DS} \times I = 0.044 \times 0.06 \times 1 = 0.00264 \right\} \]

\[ 0.5 \times S_{1} \times (R_{x}/I) = \frac{0.5 \times 1.3}{3/1} = 0.2167 \]

\( Cs_x \) upper limit = \( S_{D1} / (T_{used} \times (R_x/I)) = 1.36 / (0.701 \times (3/1)) = 0.6469 \)

\( Cs_x \) used = 0.2167

Seismic Base Shear \( V = Cs \times W = 0.2167 \times (200 \times 4) = 173.3 \text{ kN} \)

Lateral seismic force \( F_x = C_{ux} \times V \)

where

\[ C_{ux} = W_x \times h_x^k / \sum W_i \times h_i^k \]

Since \( T_{used} = 0.701 \text{ sec} > 0.5 \text{ Sec} \) distribution of base shear along story levels would have the value of exponent \( k \) linearly interpolated between 1 (less than equal to 0.5 sec) and 2 (greater than equal to 2.5 sec) i.e. \( k = 1.1004 \).

V. IS 1893

V. IS 1893 2016 Response Spectrum

Calculation of base shear and its distribution along the height for response spectrum method in IS 1893 (Part 1) : 2016
Problem

A three story building is modelled in STAAD.Pro considering the following:

- Seismic zone factor, Z = 0.36
- Importance factor, I = 1.2
- Response reduction factor, R = 5
- Soil site conditions = Hard

The generated model is subjected to a response spectrum load along global X direction. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.

V. IS 1893 2016 Static Seismic

Calculation of base shear and its distribution along the height for equivalent static method in IS 1893 (Part 1) : 2016

Problem

A reinforced concrete frame structure is 4 bays at 4m ea. by 3 bays at 4m ea. in plan. The structure is 3 stories at 3m ea.

The structure is modelled in STAAD.Pro considering the following:

- Seismic zone factor, \( Z = 0.36 \) (ZONE 0.36)
- Importance factor, \( I = 1.2 \) (I 1.2)
- Response reduction factor, \( R = 5 \) (RF 5)
- Soil site condition = Hard (SS 1)
- Structure type is a reinforced concrete frame (ST 1)

The seismic weight for each floor is assumed as 100 kN applied as joint weight to nodes 39, 60 & 80. Seismic Loads as per IS 1893 (Part 1) : 2016 specifications are generated along two horizontal directions global X & global Z and also along vertical direction global Y. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.

Height = 3 × 3 = 9m

\[
T_a = 0.075h^{0.75} = 0.075 \times (9^{0.75}) = 0.39 \text{ sec}
\]

\[
[Sa/g]_x = [Sa/g]_z = 2.5 \text{ (As time period < 0.4 sec)}
\]

\[
[Sa/g]_y = 2.5 \text{ (constant)}
\]

\[
A_{h_x} = (Z/2) \times (I/R) \times [Sa/g]_x = 0.36/2 \times 1.2/5 \times 2.5 = 0.108
\]

\[
A_{h_z} = (Z/2) \times (I/R) \times [Sa/g]_z = 0.36/2 \times 1.2/5 \times 2.5 = 0.108
\]

\[
A_v = (2/3) \times (Z/2) \times (I/R) \times [Sa/g]_y = 2/3 \times 0.36/2 \times 1.2/5 \times 2.5 = 0.072
\]

\[
V_B = A_h \times W \text{ or } A_v \times W
\]

\[
V_{B_x} = A_{h_x} \times W = 0.108 \times (3 \times 100) = 32.4 \text{ kN}
\]
Verification Examples
V.06 Loading

\[ \text{VB}_{\text{min}} = 2.4\% \text{ of } W = 2.4 \times (3 \times 100) / 100 = 7.2 \text{ kN} \]
\[ \text{VB}_x > \text{VB}_{\text{min}} \]
\[ \text{VB}_z = \text{Ah}_z \times W = 0.108 \times (3 \times 100) = 32.4 \text{ kN} \]
\[ \text{VB}_{\text{min}} = 2.4\% \text{ of } W = 2.4 \times (3 \times 100) / 100 = 7.2 \text{ kN} \]
\[ \text{VB}_z > \text{VB}_{\text{min}} \]
\[ \text{VB}_y = \text{Av} \times W = 0.072 \times (3 \times 100) = 21.6 \text{ kN} \]

### V. IS 1893 2016 GL Calculation

### Details

The following structure is modelled.
Verification Examples
V.06 Loading

The STAAD.Pro load definition parameters are also specified:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>STAAD.Pro Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Seismic zone factor, Z</td>
<td>0.16</td>
<td>Z 0.16</td>

<td>RF 3</td>
</tr>
<tr>
<td>Soil site condition</td>
<td>Hard soil</td>
<td>SS 1</td>
</tr>
</tbody>
</table>
Parameter | Value | STAAD.Pro Value
---|---|---
Structure type | Steel moment-resisting frame building | ST 3

Total height of the building is 100 ft  
Dimension of each floor slab is 20 ft × 10 ft  
Floor to floor height for super structure is 10 ft  
Floor to floor height for sub structure is 5 ft  
GL is located at -2 ft (Y co-ordinate)  
Depth of Foundation (DT) is (20 - 2) = 18 ft = 5.4864 m  
All the analytical members are W shaped steel beam (W12X190)  
Supports are fixed  
The generated model is subjected to joint weight (100 kip). The base shear and its distribution along the height is calculated in Global X, Global Z, Global Y direction.

Verification

Design horizontal acceleration coefficient value calculation for above GL and below GL for Global X (Ah), Global Z (Ah), Global Y (Av) direction.

### V. IS 1893 2016 Irregular Modes of Oscillation

Verify irregular modes of oscillation check in accordance to IS 1893 2016 Part 1 specifications.

#### Details

A three story structure is modelled with floor diaphragms defined at the story levels.
Seismic parameters:

- Seismic Zone Factor, $Z = 0.36$
- Importance Factor, $I = 1.2$
- Response Reduction Factor, $R = 5$
- Site soil conditions: hard soil (SS 1)
- Structure type: other (ST 5)

**Verification**

Since the structure is in Zone V the check has two parts. These include:

1. First three lateral translational modes together contribute at least 65% mass participation factor in each principal plan direction.
2. The fundamental lateral natural periods of the building in the two principal plan directions are away from each other by at least 10% of the larger value.

Looking at the mass participation factor table in output file following observations are made:
### First three lateral translational modes for X direction are:

<table>
<thead>
<tr>
<th>Mode Number</th>
<th>Mass Participation (%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>25.58</td>
</tr>
<tr>
<td>5</td>
<td>59.03</td>
</tr>
<tr>
<td>8</td>
<td>14.69</td>
</tr>
<tr>
<td>Sum</td>
<td>99.3</td>
</tr>
<tr>
<td>Status (PASS if sum &gt; 65%)</td>
<td>PASS</td>
</tr>
</tbody>
</table>

### First three lateral translational modes for Z direction are:

<table>
<thead>
<tr>
<th>Mode Number</th>
<th>Mass Participation (%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>32.66</td>
</tr>
<tr>
<td>4</td>
<td>46.31</td>
</tr>
<tr>
<td>7</td>
<td>21.02</td>
</tr>
<tr>
<td>Sum</td>
<td>99.99</td>
</tr>
<tr>
<td>Status (PASS if sum &gt; 65%)</td>
<td>PASS</td>
</tr>
</tbody>
</table>

The sum of first three lateral translational modes for both X and Z directions are more than 65% and hence, the check for irregular modes of oscillation passes for both X and Z directions.
Also, it is observed that the maximum mass participation for X direction occurs in mode 5 and for Z direction occurs in mode 4. Hence for the second part of the check the period of these modes needs to be checked for being away from each other by at least 10% of the larger value.

V. IS 1893 2016 Mass Irregularity

Verify mass irregularity check in accordance to IS 1893 2016 Part 1 specifications.

Details

A three story structure is modelled with floor diaphragms defined at the story levels.

Seismic parameters:

Seismic Zone Factor, $Z = 0.36$
Importance Factor, $I = 1.2$
Response Reduction Factor, $R = 5$
Site soil conditions: hard soil (SS 1)
Structure type: other: (ST 5)

**Verification**

Diaphragm 1 = 1st Floor: Weight = 10 x 4 = 40 kN  
Diaphragm 2 = 2nd Floor: Weight = 16 x 4 = 64 kN  
Diaphragm 3 = 3rd Floor: Weight = 23 x 4 = 92 kN

#### Related Links
- **TR.28.2.2 Check Irregularities** (on page 2308)

#### V. IS 1893 2016 Reentrant Corners

Verify reentrant corner (plan irregularity) check in accordance to IS 1893 2016 Part 1 specifications.

#### Details

A two story structure is modelled with diaphragms at the story levels.
Verification Examples

V.06 Loading

Figure 426: Isometric View
Seismic parameters:

- Seismic Zone Factor, $Z = 0.36$
- Importance Factor, $I = 1.2$
- Response Reduction Factor, $R = 5$
- Site soil conditions: hard soil (SS 1)
- Structure type: other (ST 5)

**Verification**

Both diaphragms have the same dimensions and are doubly-symmetric. The overall building width in either direction is 12 m and the potential reentrant corner sides are 4 m. Therefore, the ratio of the $A/L = 4 \, m / 12 \, m = 0.333 > 0.15$.

Thus, each of the four corners are reentrant corners per the IS 1893 2016 code.

## V. IS 1893 2016 Response Spectrum Vertical

### Details

The structure is modelled in STAAD.Pro considering the following:

- Seismic zone factor, $Z = 0.36$
- Importance factor, $I = 1.2$
- Response reduction factor, $R = 5$
- Soil site conditions = Hard

### Related Links

- [TR.28.2.2 Check Irregularities](#) (on page 2308)

### Calculation

The structure is modelled in STAAD.Pro considering the following:

- Seismic zone factor, $Z = 0.36$
- Importance factor, $I = 1.2$
- Response reduction factor, $R = 5$
- Soil site conditions = Hard

- **STAAD SPACE**

---

**STAAD Space** -- Page No.
The dimension of the columns is 0.2m x 0.1 m and material is concrete.
The generated model is subjected to a response spectrum load along global Y direction.
Natural frequencies / time period and mode shapes are obtained from the STAAD.Pro output file.

V. IS 1893 2016 Torsion Irregularity

Verify part 1 of the torsional irregularity check per the IS 1893 2016 Part 1 specifications.

Details

A three story building is modelled with floor diaphragms defined at each floor level.

A 1 kip (4.4482 kN) load is applied to each diaphragm in both the global X and Z directions. In STAAD.Pro, this is modelled using an analytical node in each diaphragm. This is used to obtain the displacements in the nodes of the diaphragm.
Nodes 17, 18, and 19 are the control nodes in each diaphragm.

![Structure Diagram](image)

Figure 428: Structure diagram

Validation

As per Cl. 7.8.2, the design eccentricity, $e_{di}$, is computed as the a constant times the dynamic eccentricity plus or minus the accidental eccentricity:

$$
e_{di} = \begin{cases} 
1.5e_{si} + 0.05b_i & \text{(Case 1)} \\
1.0e_{si} - 0.05b_i & \text{(Case 2)} 
\end{cases}$$

where

- $e_{si} = \text{the static eccentricity at floor } i$, which is the distance between the center of rigidity and the center of mass at that level
- $b_i = \text{the floor plan dimension at floor } i$, perpendicular to the direction of force

Also, to perform a torsion irregularity check unit load should be applied at $e_{di}$ considering design eccentricity. Hence, in addition to unit load $F = 1 \text{ kip (4.45 kN)}$, a moment $M = F \times \text{lever arm}$ is also applied at the center of mass.

The displacements induced because of the applied loads on the control nodes for the nodes situated on the extremities of each diaphragm is taken from the STAAD.Pro output for each lateral direction.
**X direction**

By inspection, the center of rigidity (as reported by STAAD.Pro) and the center of mass are located at the same point at each floor. Therefore, \( e_{si} = 0 \).

### V. IS 1893 2015 Response Spectrum

Calculate the base shear and its distribution along the height for the response spectrum method in the IS 1893 (Part4): 2015 specification.
Details

![A three story frame](image)

**Figure 429: A three story frame**

Beam and column dimensions: 500 mm × 500 mm

Material: concrete

The structure is modelled in STAAD.Pro considering the following:

- Seismic zone factor, $Z = 0.16$ (ZONE 0.16)
- Importance factor, $I = 1.5$ (I 1.5)
- Response reduction factor, $R = 5$ (RF 5)
- Soil site condition = Soft (SOIL TYPE 3)
- Minimum factor of total weight for base shear (RMIN 2.75)

### V. IS 1893 2015 Static Seismic

Calculate the design lateral force at each node in each global direction by the equivalent static seismic method per the IS 1893 (Part 4) 2015 specification.

**Details**

The loads at each node are taken as the same in each global direction (i.e., $W_{x_i} = W_{z_i} = W_{y_i}$). Loads at nodes 2, 8, and 14 are 15 kN ea. Loads at nodes 3, 4, 7, 9, 12, and 13 are 10 kN ea.
Sections used for all members: ISMB 450
Materials used: steel
The structure is modelled in STAAD.Pro considering the following:

Seismic zone factor, \( Z = 0.36 \) (ZONE 0.36)
Importance factor, \( I = 1.0 \) (I 1.0)
Response reduction factor, \( R = 5 \) (RF 5)
Soil site condition = Hard (SS 1)
Structure type is a category 4 (ST 4)
2\% Damping (DM 0.02)

Validation

Seismic Load
Seismic Loads as per IS 1893 (Part 4): 2015 specifications are generated along two horizontal directions, global X & global Z and also along vertical direction, global Y.
Time period in X direction: \( T_x = 0.09734 \) sec.
Time period in Z direction: \( T_z = 0.51406 \) sec.
Time Period, \( T \), is calculated by the Rayleigh Method
As per Table 15 of IS 1893 (Part 4): 2015
Damping Factor (DF) = 2\% damping = 1.4
From figure 1 of IS 1893 (Part 4): 2015, for Hard Soil sites for (0 second < \( T < 0.1 \) second)
Spectral acceleration coefficient value \( \left( \frac{S_g}{g} \right) \) in X, Z, and Y directions for 2\% damping:
\[
\frac{S_g}{g}_x = DF \times \left( 1 + 15T \right) = 1.4 \times \left[ 1 + \left( 15 \times 0.09734 \right) \right] = 3.444
\]
From figure 1 of IS 1893 (Part 4): 2015, for Hard Soil sites for (0.4 second < \( T < 10 \) second)
\[
\frac{S_g}{g}_z = DF \times \frac{1}{T} = 1.4 \times \frac{1}{0.51406} = 2.723
\]
As per clause 10.2 of IS 1893 (Part 4): 2015
\[
\frac{S_g}{g}_y = \frac{2}{3} \times \text{Maximum of} \left( \frac{S_g}{g}_x, \frac{S_g}{g}_z \right) = \frac{2}{3} \times 3.444 = 2.296
\]
As per clause 7.3.2 of IS 1893 (Part 4): 2015
The seismic coefficient in X, Z and Y direction
\[
A_{h_x} = \frac{Z}{2} \times \frac{I}{R} \times \frac{S_g}{g}_x = \frac{0.36}{2} \times \frac{1}{5} \times 3.444 = 0.124
\]
\[
A_{h_z} = \frac{Z}{2} \times \frac{I}{R} \times \frac{S_g}{g}_z = \frac{0.36}{2} \times \frac{1}{5} \times 2.723 = 0.098
\]
\[
A_{h_y} = \frac{Z}{2} \times \frac{I}{R} \times \frac{S_g}{g}_y = \frac{0.36}{2} \times \frac{1}{5} \times 2.296 = 0.083
\]

V. IS 1893 2002 Response Spectrum

Problem

A three story building is modelled in STAAD.Pro considering the following:

- Seismic zone factor, $Z = 0.36$
- Importance factor, $I = 1$
- Response reduction factor, $R = 5$
- Soil site conditions = Hard

The generated model is subjected to a response spectrum load along global X direction. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.

V. IS 1893 2002 Static Seismic

Calculation of base shear and its distribution along the height for equivalent static method in IS 1893 (Part 1) : 2002

Problem

A reinforced concrete frame structure is 4 bays at 4m ea. by 3 bays at 4m ea. in plan. The structure is 3 stories at 3m ea.

The structure is modelled in STAAD.Pro considering the following:

- Seismic zone factor, $Z = 0.36$ (ZONE 0.36)
- Importance factor, $I = 1$ (I 1)
- Response reduction factor, $R = 5$ (RF 5)
- Soil site condition = Hard (SS 1)
- Structure type is a reinforced concrete frame (ST 1)

The seismic weight for each floor is assumed as 100 kN applied as joint weight to nodes 39, 60, & 80. Seismic Loads as per IS 1893 (Part 1) : 2002 specifications are generated along two horizontal directions global X & global Z. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.

Height $= 3 \times 3 = 9$ m

$$T_a = 0.075h^{0.75} = 0.075 \times (9^{0.75}) = 0.39 \text{ sec}$$

$$[S_a/g]_x = [S_a/g]_z = 2.5 \text{ (As time period < 0.4 sec)}$$

$$A_h = (Z/2) \times (I/R) \times [S_a/g]_x = 0.36/2 \times 1/5 \times 2.5 = 0.09$$

$$V_B = A_h \times W$$

$V_B_x = A_h_x \times W = 0.09 \times (3 \times 100) = 27 \text{ kN}$

$V_B_z = A_h_z \times W = 0.09 \times (3 \times 100) = 27 \text{ kN}$

V. Moving Load

V. Moving Load Generator

To validate the effect of wheel load assembly on bridge girders simulated by a series of equivalent concentrated loads for a particular wheel position, generated by Moving Load generation option.

Details

A bridge decking system of 10 m span is simulated by three longitudinal girder of size 0.3 m × 0.6 m (Concrete) at a spacing of 2 m and six transverse girders of size 0.3 m × 0.45 m (Concrete) at a spacing of 2 m. Longitudinal girders are pinned support at both the ends.

Vehicle definition – 10 kN and 16 kN per wheel in the Front and Rear Axle respectively. The vehicle width is 1.2 m and the axle distance is 1.5 m. Starting position is from the end of the deck, aligning the rear axle along the last transverse girder. The direction of movement along the longitudinal girder with an incremental distance of 0.5 m.

Validation

Among the generated wheel loads, for the 9th position of the wheel assembly, the structure is analyzed for that generated load. The structure is again analyzed with the static load system equivalent to the generated wheel load and observed the difference in results if any.

![Figure 430: The position of the generated load case 9](image)

Note: The postprocessing diagrams in STAAD.Pro show two overlapping 7 kN axle reactions on member 14.

The model uses the moving load generator facility and a static load equivalent to the generated Load Case 9 (i.e., 9th position of the wheel assembly). Both support reactions and joint displacements are compared.
Comparison

Verification Examples

V. NRC

V. NRC 2010 Response Spectrum

Details

Example 4.7(1) is modeled in STAAD.Pro.

The generated model is subjected to a Response Spectrum Load along global X direction. Time-Acceleration pairs for the spectrum data can be seen in supporting excel file NRC_Calculation.xlsx within worksheet named RS Values. The direction factor along global X direction is assumed as 0.5. The base shear reported by STAAD.Pro is verified against hand calculation.

V. NRC 2010 Static Seismic

Calculation of base shear and its distribution along the height for equivalent static force method in NBCC/NRC 2010.

Problem

Structure to be modelled:

- height = 3× 5m = 15m
- plan dimension X = 5m
- plan dimension Z = 5m

Input parameters:

- Seismic acceleration values Sa(0.2) = 0.28, Sa(0.5) = 0.17, Sa(1.0) = 0.11, and Sa(2) = 0.063 (SA1 0.28, SA2 0.17, SA3 0.11, SA4 0.063)
- Importance factor = 1.3 (I 1.3)
- Site class C (SCL 3)
- Higher mode factor X = 1 (MVX 1)
- Higher mode factor Z = 1 (MVZ 1)
- Ductility-related force modification factor X = 5 (RDX 5)
- Ductility-related force modification factor Z = 5 (RDZ 5)
- Overstrength-related force modification factor X = 5 (ROX 1.5)
- Overstrength-related force modification factor Z = 5 (ROZ 1.5)
- Moment resisting frames in both X and Z directions (STX 1, STZ 1)
- Provisions to be checked for member strength (MD 1)

The seismic weight for each floor is assumed as 200 kN applied as joint weight of 50kN to nodes 2 3 6 7 9 To 16. Seismic Load as per NBCC/NRC 2010 specifications are generated along horizontal direction global X and global Z. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.

\[ T_{ax} = 0.075 \times (h_n)^{0.75} \] (for concrete moment frames) = 0.075 × 15^{0.75} = 0.57 sec

\[ T_{az} = 0.075 \times (h_n)^{0.75} \] (for concrete moment frames) = 0.075 × 15^{0.75} = 0.57 sec

\[ T_{cx} \] (Rayleigh method from output file) = 0.467, \[ T_{cz} \] (Rayleigh method from output file) = 0.467

\[ 1.5 \times T_{ax} = 0.86 > T_{cx} \text{ so } T_{ax} = T_{cx} = 0.467 \]

\[ 1.5 \times T_{az} = 0.86 > T_{cz} \text{ so } T_{az} = T_{cz} = 0.467 \]

\[ F_a = 1 \text{ (For Site Class = C and } Sa(0.2) = 0.28) \]
Verification Examples

V.06 Loading

\[ F_v = 1 \] (For Site Class = C and \( Sa(1.0) = 0.11 \))

\[ S(0.2) = Fa \times Sa(0.2) = 1 \times 0.28 = 0.28 \]

\[ S(0.5) = \text{smaller of } F_v \times Sa(0.5) \text{ and } Fa \times Sa(0.2) = \text{smaller of } 1 \times 0.17 \text{ and } 1 \times 0.28 = 0.17 \]

\[ S(T_{\text{used}})_x = S(T_{\text{used}})_z = 0.17 + ((0.28-0.17)/(0.5-0.2) \times (0.5-0.467)) = 0.1821 \]

\[ V_x = S(T_{\text{used}})_x \times MVX \times I \times W / RDX \times ROX = 0.1821 \times 1 \times 1.3 \times (200x3) / 5 \times 1.5 = 18.9384 \text{ kN} \]

Min Base Shear = \( S(2.0) \times MVX \times I \times W / (RDX \times ROX) = 0.063 \times 1 \times 1.3 \times (200x3) / 5 \times 1.5 = 6.552 \text{ kN} \)

Max Base Shear = \( 2/3 \times S(0.2) \times I \times W / (RDZ \times ROZ) = 2/3 \times 0.28 \times 1.3 \times (200x3) / 5 \times 1.5 = 19.413 \text{ kN} \)

\[ V_x > \text{Min Base Shear} \& V_x < \text{Max Base Shear}, V_x = 18.9384 \text{ kN} \]

\[ V_z = S(T_{\text{used}})_z \times MVZ \times I \times W / RDZ \times ROZ = 0.1821 \times 1 \times 1.3 \times (200x3) / 5 \times 1.5 = 18.9384 \text{ kN} \]

Min Base Shear = \( S(2.0) \times MVZ \times I \times W / (RDZ \times ROZ) = 0.063 \times 1 \times 1.3 \times (200x3) / 5 \times 1.5 = 6.552 \text{ kN} \)

Max Base Shear = \( 2/3 \times S(0.2) \times I \times W / (RDZ \times ROZ) = 2/3 \times 0.28 \times 1.3 \times (200x3) / 5 \times 1.5 = 19.413 \text{ kN} \)

\[ V_z > \text{Min Base Shear} \& V_z < \text{Max Base Shear}, V_z = 18.9384 \text{ kN} \]

Since fundamental lateral period < 0.7 sec \( F_t = 0 \), calculated Base Shear is distributed along the height as under:

\[ F_x = (V - 0) \times (W_x \times h_x / \sum W_i \times h_i) = (V) \times (W_x \times h_x / \sum W_i \times h_i) \]

V. NRC 2005 Response Spectrum

Details

Example 4.7(1) is modeled in STAAD.Pro.

The generated model is subjected to a Response Spectrum Load along global X direction. Time-Acceleration pairs for the spectrum data can be seen in supporting excel file NRC_Calculation.xlsx within worksheet named RS Values. The direction factor along global X direction is assumed as 0.5. The base shear reported by STAAD.Pro is verified against hand calculation.

### STAAD.Pro 3589 User Manual
V. NRC 2005 Static Seismic

Calculation of base shear and its distribution along the height for equivalent static force method in NBCC/NRC 2005.

Problem

Structure to be modelled:

- height = 3 × 5 m = 15 m
- plan dimension X = 5 m
- plan dimension Z = 5 m

Input parameters:

- Seismic acceleration values Sa(0.2) = 0.28, Sa(0.5) = 0.17, Sa(1.0) = 0.11, and Sa(2) = 0.063 (SA1 0.28, SA2 0.17, SA3 0.11, SA4 0.063)
- Importance factor = 1.3 (IE 1.3)
- Site class C (SCL 3)
- Higher mode factor X = 1 (MVX 1)
- Higher mode factor Z = 1 (MVZ 1)
- Numerical reduction coefficient for base overturning X = 1 (JX 1)
- Numerical reduction coefficient for base overturning Z = 1 (JZ 1)
- Ductility-related force modification factor X = 5 (RDX 5)
- Ductility-related force modification factor Z = 5 (RDZ 5)
- Overstrength-related force modification factor X = 5 (ROX 1.5)
- Overstrength-related force modification factor Z = 5 (ROZ 1.5)

The seismic weight for each floor is assumed as 200 kN applied as joint weight of 50 kN to nodes 2 3 6 7 9 To 16. Seismic Load as per NBCC/NRC 2005 specifications are generated along horizontal direction global X and global Z. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.

\[ T_a = 0.075 \cdot (hn)^{0.75} \quad \text{(for concrete moment frames)} \]
\[ T_a = 0.075 \cdot (hn)^{0.75} \quad \text{(for concrete moment frames)} \]
\[ T_c (\text{Rayleigh method from output file}) = 0.467, \quad T_c (\text{Rayleigh method from output file}) = 0.467 \]

1.5 × Ta_x = 0.857474013 > T_c, so Ta_used = T_c = 0.467
1.5 × Ta_z = 0.857474013 > T_c, so Ta_used = T_c = 0.467

Fa = 1 (For Site Class = C and Sa(0.2) = 0.28)
Verification Examples
V.06 Loading

\[ F_v = 1 \text{ (For Site Class = C and Sa(1.0) = 0.11)} \]
\[ S(0.2) = Fa \times Sa(0.2) = 1 \times 0.28 = 0.28 \]
\[ S(0.5) = \text{smaller of } F_v \times Sa(0.5) \text{ and } Fa \times Sa(0.2) = \text{smaller of } 1 \times 0.17 \text{ and } 1 \times 0.28 = 0.17 \]
\[ S(T_{\text{used}})_x = S(T_{\text{used}})_z = 0.17 + ((0.28-0.17)/(0.5-0.2)) \times (0.5-0.467) = 0.1821 \]
\[ V_x = S(T_{\text{used}})_x \times MV_x \times I \times W / (RDX \times ROX) = 0.1821 \times 1 \times 1.3 \times (200\times3) / 5 \times 1.5 = 18.9384 \text{ kN} \]
Min Base Shear = \[ S(2.0) \times MV_x \times I / (RDX \times ROX) = 0.063 \times 1 \times 1.3 \times (200\times3) / 5 \times 1.5 = 6.552 \text{ kN} \]
Max Base Shear = \[ 2/3 \times S(0.2) \times I \times W / (RDX \times ROX) = 2/3 \times 0.28 \times 1.3 \times (200\times3) / 5 \times 1.5 = 19.413 \text{ kN} \]
\[ V_x > \text{Min Base Shear} \text{ & } V_x < \text{Max Base Shear}, V_x = 18.9384 \text{ kN} \]
\[ V_z = S(T_{\text{used}})_z \times MV_z \times I \times W / (RDZ \times ROZ) = 0.1821 \times 1 \times 1.3 \times (200\times3) / 5 \times 1.5 = 18.9384 \text{ kN} \]
Min Base Shear = \[ S(2.0) \times MV_z \times I / (RDZ \times ROZ) = 0.063 \times 1 \times 1.3 \times (200\times3) / 5 \times 1.5 = 6.552 \text{ kN} \]
Max Base Shear = \[ 2/3 \times S(0.2) \times I \times W / (RDZ \times ROZ) = 2/3 \times 0.28 \times 1.3 \times (200\times3) / 5 \times 1.5 = 19.413 \text{ kN} \]
\[ V_z > \text{Min Base Shear} \text{ & } V_z < \text{Max Base Shear}, V_z = 18.9384 \text{ kN} \]
Since fundamental lateral period < 0.7 sec \( F_t = 0 \), calculated Base Shear is distributed along the height as under:
\[ F_x = (V - 0) \times (W_x \times h_x / \sum W_i \times h_i) = (V) \times (W_x \times h_x / \sum W_i \times h_i) \]

V. UBC

V. UBC 1997 Static Seismic

Calculation of base shear and its distribution along the height for equivalent lateral force method in UBC 1997.

Problem

Structure to be modelled:

- height = 4× 4m = 16m
- plan dimension X = 4m
- plan dimension Z = 5m
Input parameters:

Zone = 0.4
Importance factor = 1.0
Response modification factor X = 3.5
Response modification factor Z = 3.5
Site type = 3
Building period coefficient, $C_T = 0.0731$
Near source factor, $N_a = 1.5$
Near source factor, $N_v = 2$

The seismic weight for each floor is assumed as 200 kN applied as joint weight of 50kN to nodes 2 3 5 6 8 9 11 To 20. Seismic Load as per UBC 1997 specifications are generated along horizontal direction global X. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.
Calculations

Structure period calculation:

A. Height = \( h_n = 16m \), \( T_a = C_T \times h_n = 0.0731 \times 16^{0.75} = 0.585 \)

B. \( T_b \) (from output file) = 1.286

Since \( Zone = 0.4 \& T_b > 1.3 \times T_a \); \( T = T_a = 0.585 \)

For \( STYP = 3 \& Zone = 0.4 \); \( C_a = 0.4 \times NA = 0.4 \times 1.5 = 0.6 \)

For \( STYP = 3 \& Zone = 0.4 \); \( C_v = 0.56 \times NV = 0.56 \times 2 = 1.12 \)

Design base shear calculation:

\[
V = C_v/R \times I/T \times W = 1.12/3.5 \times 1/0.585 \times (200 \times 4) = 0.547 \times 800 = 437.6 \text{ kN}
\]

\[
V_{\text{Upper Limit}} = (2.5 \times C_a \times I)/R \times W = (2.5 \times 0.6 \times 1)/3.5 \times (200 \times 4) = 0.4286 \times 800 = 342.88 \text{ kN}
\]

\[
V_{\text{lower limit}} = 0.8 \times Z \times N_v \times I/R \times W = 0.8 \times 0.4 \times 2 \times 1/3.5 \times (200 \times 4)
\]

\[
= 0.1829 \times 800 = 146.3 \text{ kN}
\]

Hence Design Base Shear \( V = 342.88 \text{ kN} \)

Lateral seismic force \( F_x = (W_x \times h_x / \sum W_i \times h_i) \times (V - F_t) \)

Since \( T = 0.585 < 0.7 \text{ sec} \); \( F_t = 0 \)

V. UBC 1994 Static Seismic

Calculation of base shear and its distribution along the height for equivalent lateral force method in UBC 1994.

Problem

Structure to be modelled:

- height = 4× 4m = 16m
- plan dimension X = 4m
- plan dimension Z = 5m
Input parameters:

- Zone = 0.4
- Site coefficient, $S = 1$
- Building period coefficient, $C_T = 0.0731$
- Importance factor = 1.0 ($I = 1.0$)
- Response modification factor $X = 3$ ($RX = 3$)
- Response modification factor $Z = 3$ ($RX = 3$)

The seismic weight for each floor is assumed as 200 kN applied as joint weight of 50kN to nodes 2 3 5 6 8 9 11 To 20. Seismic Load as per UBC 1994 specifications are generated along horizontal direction global X. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.

**Calculations**

Structure period calculation:
A. Height = $hn = 16m$, $Ta = C_T \times hn^2 = 0.0731 \times 16^{0.75} = 0.585$

B. Tb (from output file) = 1.286

$T_{used} = 0.585$

$$C = 1.25 \times \frac{S}{(T^{2/3})} = 1.25 \times 1 / (0.585^{2/3}) = 1.787$$

Design base shear calculation:

$$V = (Z \times I \times C / R_{wx}) \times W = (0.4 \times 1 \times 1.787 / 3) \times (200 \times 4) = 0.2383 \times 800 = 190.62 \text{ kN}$$

Lateral seismic force $F_x = (W_x \times h_x / \sum W_i \times h_i) \times (V - F_t)$

Since $T = 0.585 < 0.7 \text{ sec}$, $F_t = 0$

V. Wind Load

V. ASCE 7-16 Wind Load Generation on Building

Verify the windward loads due to wind on a portion of a building structure calculated per the ASCE 7-16 specification.

Details

The wind load is calculated for a building structure using the direction procedure for MWFRS of enclosed buildings (ASCE 7-16, Chapter 27). The following assumptions and parameters apply:

- Flat roof type
- Category II building (Table 1.5-1)
- Basic wind speed = 108 mph
- Ground height above sea level = 230 ft
- Structure type of “building”
- Exposure Category B
- Do not consider wind speed-up over hills or escarpments
- Building height = 40 ft
- Building length along the wind direction, L = 30 ft
- Building width normal to wind direction, B = 25 ft
- Natural frequency of structure = 2 Hz (i.e., a “rigid” building per Cl. 26.2)
- Damping ratio = 0.01
Enclosed building

The portion of the building below 20' in height is blocked by an adjacent structure or other obstruction. Calculate the resulting joint loads on the windward side due to wind along the X axis at the upper wall of one segment of the building.

Figure 431: Building structure with portion of wind load
Validation

Directionality factor, \( K_d = 0.85 \) (Table 26.6-1)

Topographic factor, \( K_{zt} = 1.0 \)

Ground elevation factor, \( K_e = e^{-0.0000362 \times 230} = 0.9917 \) (Table 26.9-1)

The velocity pressure exposure coefficients \((K^2)\) are calculated per the formulae given in Table 26.10-1:

\[
K_z = \begin{cases} 
2.01 \left( \frac{15}{z_g} \right)^{2/a} & \text{for } z < 15 \text{ ft} \\
2.01 \left( \frac{z}{z_g} \right)^{2/a} & \text{for } 15 \text{ ft} \leq z \leq z_g 
\end{cases}
\]  

(Table 26.10.1)

where

\[
\begin{align*}
a &= 7 \\
z_g &= 1,200 \text{ ft}
\end{align*}
\]

See the table below for the values of \( K^2 \) at discrete values of \( z \).

Velocity pressure, \( q_z \)

\[
q_z = 0.00256 \times K_d K_{zt} K_e V^2
\]  

(Cl. 26.10-1)

Mean roof height = height of the building = 40 ft. Refer to table below for calculation of \( q_z \) at the mean roof height.

Gust effect factor, \( G \)

\( G \) is calculated per Cl. 26.11.4 for rigid structures:

\[
G = 0.925 \left( \frac{1 + 1.7g_q I_z Q}{1 + 1.7g_v I_z} \right)
\]  

(Cl. 26.11.4)

where

\[
\begin{align*}
g_q = g_v &= 3.4 \\
\bar{z} &= \max \left| \frac{30}{0.6 \times h} = 30 \text{ ft} \right|
\end{align*}
\]
\[ \epsilon = \frac{1}{3} \]
\[ \ell = 320 \text{ ft} \]
\[ c = 0.3 \]
\[ L \bar{z} = \left( \frac{\ell}{33} \right)^{\epsilon} = 309.99 \text{ ft} \]
\[ Q = \sqrt{\frac{1}{1 + 0.63 \left( \frac{B + h}{L \bar{z}} \right)^{0.63}}} = \sqrt{\frac{1}{1 + 0.63 \left( \frac{25 + 40}{309.99} \right)^{0.63}}} = 0.8997 \]
\[ I \bar{z} = c \left( \frac{33}{\bar{z}} \right)^{1/6} = 0.3048 \]

Therefore, \( G = 0.925 \left( \frac{1 + 1.7 \times 3.4 \times 0.3048 \times 0.8997}{1 + 1.7 \times 3.4 \times 0.3048} \right) = 0.8658 \)

Wall pressure coefficient, \( C_p = 0.8 \) for windward per Fig. 27.3-1.

The external design pressure, \( p = q_h G C_p \)

The internal pressure coefficient, \( G C_{pi} = -0.18 \) for partially enclosed buildings per Table 26.13-1.

The internal design pressure, \( p_i = q_i(GC_{pi}) = 19.14 \times -0.18 = -3.45 \text{ lb/ft}^2 \)

where \( q_i = \text{the velocity pressure evaluated at the building height, } h = q_h \)

The design wind pressure, \( p \), is then calculated as:

\[ p = q_z G C_p - q_i(GC_{pi}) \]  
(Eq. 29.4-1)

**Note:** To compare different wind load calculations with STAAD.Pro, the tributary areas below are selected based on the applied wind area defined in the model. These do not include any surrounding wind areas outside of the indicated area, which would have wind applied in a typical situation.

Load on Nodes 21 and 22
Wind pressure at half-way between this node and level above (25') = 15.04 lb/ft$^2$.

\[ F = (9 \text{ ft} / 2) \times (10 \text{ ft} / 2) \times 15.04 \text{ lb/ft}^2 \times (10)^{-3} = 0.338 \text{ kips} \]

**Load on Nodes 31 and 32**

Wind pressure at half-way between this node and level below (25') = 15.04 lb/ft$^2$.

Wind pressure at half-way between this node and level above (35') = 16.21 lb/ft$^2$.

\[ F = (9 \text{ ft} / 2) \times (10 \text{ ft} / 2) \times (15.04 \text{ lb/ft}^2 + 16.21 \text{ lb/ft}^2) \times (10)^{-3} = 0.703 \text{ kips} \]

**Load on Nodes 41 and 42**
Figure 435: Tributary area for nodes 41 and 42

Wind pressure at roof level (40') = 16.71 lb/ft$^2$.

$$F = \left(\frac{9 \text{ ft}}{2}\right) \times \left(\frac{10 \text{ ft}}{2}\right) \times (16.71 \text{ lb/ft}^2) \times (10)^{-3} = 0.376 \text{ kips}$$

Load on Node 29

Figure 436: Tributary area for node 29

Wind pressure at half-way between this node and level above (25') = 15.04 lb/ft$^2$.

$$F = (9 \text{ ft}) \times \left(\frac{10 \text{ ft}}{2}\right) \times 15.04 \text{ lb/ft}^2 \times (10)^{-3} = 0.677 \text{ kips}$$

Load on Node 39
Wind pressure at half-way between this node and level below (25\') = 15.04 lb/ft$^2$.

Wind pressure at half-way between this node and level above (35\') = 16.21 lb/ft$^2$.

$$F = (9\text{ ft}) \times (10\text{ ft} / 2) \times (15.04 \text{ lb/ft}^2 + 16.21 \text{ lb/ft}^2) \times (10^{-3}) = 1.406 \text{ kips}$$

**Load on Node 49**

Wind pressure at roof level (40\') = 16.71 lb/ft$^2$.

$$F = (9\text{ ft}) \times (10\text{ ft} / 2) \times (16.71 \text{ lb/ft}^2) \times (10^{-3}) = 0.752 \text{ kips}$$

V. ASCE 7-16 Wind Load Generation on Tank

Verify the windward loads due to wind on a portion of a tank structure calculated per the ASCE 7-16 specification.

Details

The wind load is calculated for a tank structure using the direction procedure for MWFRS of enclosed buildings (ASCE 7-16, Chapter 27). The following assumptions and parameters apply:

Category II building (Table 1.5-1)
Basic wind speed = 108 mph
Ground height above sea level = 520 ft
Structure type of “chimney, tank, or similar structure”
Exposure Category B
Wind speed-up over hills or escarpments is considered: a two-dimension ridge of height, \( H = 300 \) ft. The distance upwind of crest, \( L_h = 650 \) ft and the distance from crest to the building, \( x = 750 \) ft
Height of tank = 40 ft
The least horizontal dimension (W or D), \( D = 25 \) ft
Round axisymmetric horizontal cross-section
Depth of protruding elements, \( D' = 0.5 \) ft
Natural frequency of structure = 2 Hz (i.e., a “rigid” building per Cl. 26.2)
Damping ratio = 0.01
Determine the wind loads acting on a vertical portion of the upper tank structure at a two-panel segment tangent to the YZ plane. For the purpose of this example, the contributions of the surrounding tank portions are ignored (i.e., only the portions of the wind area in this segment are calculated for brevity).

Figure 439: Wind load portion considered on tank structure
Validation

Directionality factor, \( K_d = 1.0 \) (Table 26.6-1)

Topographic factor, \( K_{zt} \)

For a 2D ridge, \( K_1/(H/L_h) = 1.30, \gamma = 3, \mu = 1.5 \) (Fig 26.8-1):

\[
K_1 = 1.30 \frac{H}{L_h} = 1.30 \times \frac{300}{650} = 0.6
\]

\[
K_2 = 1 \cdot \left| \frac{x}{\mu L_h} \right| = 1 \cdot \left| \frac{750}{1.5 \times 650} \right| = 0.231
\]

\[
K_3 = e^{-\gamma z / L_h} = e^{-3 \times 40 / 650}
\]

\[
K_{zt} = (1 + K_1 K_2 K_3)^2 = (1 + 0.6 \times 0.231 \times 0.995^2)^2
\]

As \( K_{zt} \) is a function of height, it must be calculated at each elevation. Refer to the table below.

Ground elevation factor, \( K_e = e^{-0.0000362 \times 520} = 0.9814 \) (Table 26.9-1)

The velocity pressure exposure coefficients (\( K^2 \)) are calculated per the formulae given in Table 26.10-1:
\[ K_z = \begin{cases} 2.01 \left( \frac{15}{z_g} \right)^{2/\alpha} & \text{for } z < 15 \text{ ft} \\ 2.01 \left( \frac{z}{z_g} \right)^{2/\alpha} & \text{for } 15 \text{ ft} \leq z \leq z_g \end{cases} \] (Table 26.10.1)

where
\[ \alpha = 7 \]
\[ z_g = 1,200 \text{ ft} \]

See the table below for the values of \( K_z \) at discrete values of \( z \).

Velocity pressure, \( q_z \)
\[ q_z = 0.00256 \times K_z K_t K_d K_e V^2 \] (Cl. 26.10-1)

Mean roof height = height of the building = 40 ft. Refer to table below for calculation of \( q_z \) at the mean roof height.

Gust effect factor, \( G \)
\[ G = 0.925 \left( 1 + 1.7 \frac{g_q I_z}{I_z} \right) \] (Cl. 26.11.4)

where
\[ g_q = g_v = 3.4 \]
\[ \bar{z} = \max \left[ 0.6 \times h = 30 \text{ ft} \right] \]
\[ \varepsilon = 1/3 \]
\[ \ell = 320 \text{ ft} \]
\[ c = 0.3 \]
\[ L \bar{z} = \ell \left( \frac{\bar{z}}{33} \right)^{1/6} = 309.99 \text{ ft} \]
\[ Q = \left( \frac{1}{1 + 0.63} \right) \left( \frac{D + h}{L \bar{z}} \right)^{0.63} = \left( \frac{1}{1 + 0.63} \right) \left( \frac{25 + 40}{309.99} \right)^{0.63} = 0.8997 \]
\[ I_z = c \left( \frac{33}{\bar{z}} \right)^{1/6} = 0.3048 \]

Therefore, \( G = 0.925 \left( \frac{1 + 1.7 \times 3.4 \times 0.3048 \times 0.8997}{1 + 1.7 \times 3.4 \times 0.3048} \right) = 0.8658 \)

Force Coefficient, \( C_f \)
\( C_f \) is calculated as per Table 29.4-1.

\[ h/D = 40/25 = 1.6 \text{, so must linearly interpolate between 1 and 7.} \]
\[ D'/D = 0.5/25 = 0.02 \text{, so the type of surface is "rough"} \]

The minimum value of \( D / \sqrt{q_v} \) corresponds to the maximum value of \( q_v \), which is taken from the tabulated values below (at height, \( z = 40 \text{ ft} \)).

The minimum value of \( D / \sqrt{q_v} = 25 \text{ ft} \times 27.72 \text{ lb/ft}^2 = 4.75 > 2.5 \), so the force coefficient used is for round cross-sections with a relatively wide diameter and rough surface.

Linearly interpolate between values: \( C_f = \frac{(1.6 - 1) \times (0.8 - 0.7)}{(7 - 1)} + 0.7 = 0.71 \)
The design wind pressure, $p$, is then calculated as:

$$p = q_z \times G \times C_f$$

(Eq. 29.4-1)

**Note:** To compare different wind load calculations with STAAD.Pro, the tributary areas below are selected based on the applied wind area defined in the model. These do not include any surrounding wind areas outside of the indicated area, which would have wind applied in a typical situation.

The projected distance along the $Z$ axis perpendicular to the wind direction (along the $X$ axis) is

$$\sqrt{(3.1287')^2 - (0.4894')^2} = 3.09 \text{ ft}$$

Load on Nodes 10 and 12
Wind pressure at half-way between this node and level above (29.5') = 15.78 lb/ft².

\[ F = \frac{3.09 \text{ ft}}{2} \times \frac{5 \text{ ft}}{2} \times 15.78 \text{ lb/ft}^2 (10)^{-3} = 0.060 \text{ kips} \]

**Load on Node 11**

Wind pressure at half-way between this node and level above (29.5') = 15.78 lb/ft².

\[ F = (3.09 \text{ ft}) \times \frac{5 \text{ ft}}{2} \times 15.78 \text{ lb/ft}^2 (10)^{-3} = 0.120 \text{ kips} \]

**Load on Nodes 102 and 104**
Wind pressure at half-way between this node and level below (29.5') = 16.11 lb/ft².
Wind pressure at half-way between this node and level above (34.5') = 16.42 lb/ft².

\[ F = \left(\frac{3.09 \text{ ft}}{2}\right) \times \left(\frac{5 \text{ ft}}{2}\right) \times (16.11 \text{ lb/ft}^2 + 16.42 \text{ lb/ft}^2) \times 10^{-3} = 0.126 \text{ kips} \]

Figure 443: Tributary area for nodes 102 and 104

Figure 444: Tributary area for node 103
Wind pressure at half-way between this node and level below (34.5') = 16.11 lb/ft$^2$.
Wind pressure at half-way between this node and level above (29.5') = 16.42 lb/ft$^2$.

$$F = (3.09 \text{ ft}) \times (5 \text{ ft} / 2) \times (16.11 \text{ lb/ft}^2 + 16.42 \text{ lb/ft}^2) (10)^{-3} = 0.251 \text{ kips}$$

**Load on Nodes 30 and 32**

![Figure 445: Tributary area for nodes 30 and 32](image)

Wind pressure at top of tributary area (37') = 16.71 lb/ft$^2$.

$$F = (3.09 \text{ ft} / 2) \times (5 \text{ ft} / 2) \times 16.71 \text{ lb/ft}^2 (10)^{-3} = 0.065 \text{ kips}$$

**Load on Node 31**

![Figure 446: Tributary area for node 31](image)

Wind pressure at top of tributary area (37') = 16.71 lb/ft$^2$.

$$F = (3.09 \text{ ft} / 2) \times (5 \text{ ft} / 2) \times 16.71 \text{ lb/ft}^2 (10)^{-3} = 0.129 \text{ kips}$$

V. ASCE 7-10 Wind Load Generation

To validate STAAD.Pro calculated equivalent joint loads for a closed structure subjected to Wind Loading. Wind Intensity is calculated as per ASCE 07 – 2010.

Details

When closed type structures are subjected to wind load, panels or closed surfaces are generated by the program based on the members in the ranges specified and their end joints. Wind load, in such way, is converted to equivalent joint loads and applied on the nodes of that closed surface. The area within each closed surface is determined and the share of this area (influence area) for each node in the list is calculated. Wind intensities...
have been calculated as per ASCE 07 – 2010. The detailed calculation of determination of equivalent joint loads is performed here in this document.

A two-story, single-bay frame is subjected to wind loading from +X direction. Assumptions made while calculating the wind intensities are tabulated in the Validation section of this document.

Verification

Calculation of Wind Intensity

Assumptions made in determination of wind intensities as per ASCE 07 – 2010

i. Analysis Procedure – Directional Procedure for MWFRS of enclosed buildings, Chapter 27

ii. Type of roof – flat

iii. Building Classification Category = Category II (Table 1.5-1)

iv. Basic Wind Speed = 110 mph

v. Exposure Category = Exposure B (Clause 26.7.3)

vi. Wind speed-up over Hills or Escarpment is not considered

vii. Building Height = 20 ft

viii. Building length along the direction of Wind (L) = 10 ft

ix. Building length normal the direction of Wind (B) = 20 ft

x. Natural Frequency of the building = 2 Hz (Hence, as per clause 26.2, this is a rigid building)

xi. Building Damping Ratio = 0.05

xii. Enclosure Classification = Enclosed Building (Clause 26.10)

xiii. Directionality Factor Kd = 0.85 (Table 26.6-1, for MWFRS)

xiv. Topographic Factor, Kzt = 1 (Clause 26.8.2)

xv. Building Wall to generate Wind Load on – Windward side

xvi. Gust Effect Factor, G = 0.85 (Clause 26.9.1)

xvii. External pressure Coefficient Cp = 0.85 (Windward wall pressure coefficient, as per Table 27.4-1)

xviii. Internal pressure coefficient GCpi = -0.18 (For Enclosed Buildings, Table 26.11-1)

Hence, the velocity pressure exposure coefficients (Kz) are calculated as per the formulae given in Table 27.3-1:

<table>
<thead>
<tr>
<th>Height (ft)</th>
<th>Velocity Pressure Exposure Coefficient (Kz)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 15</td>
<td>0.5747196698</td>
</tr>
<tr>
<td>16</td>
<td>0.5854155685</td>
</tr>
<tr>
<td>17</td>
<td>0.5956440691</td>
</tr>
<tr>
<td>18</td>
<td>0.6054513812</td>
</tr>
<tr>
<td>19</td>
<td>0.6148768735</td>
</tr>
<tr>
<td>20</td>
<td>0.6239543877</td>
</tr>
</tbody>
</table>

As per clause 27.3.2, velocity pressure $q_z = 0.00256 \times K_z \times K_{zt} \times K_d \times V^2$ (lb/ft$^2$)

Since Mean roof height $h = $ Height of building = 20 ft

$q_h = 0.00256 \times (K_z)_{h=20\text{ ft}} \times K_{zt} \times K_d \times V^2 = 16.42847$ lb/ft$^2$

Design wind pressure, $p$ is calculated as per clause 27.4.1 as -
\[ p = q \times G \times C_p - q_i \times (GC_{pi}) \]

Values of \( q_i \) and \( p \) for different heights are calculated using the above formulae and tabulated below.

<table>
<thead>
<tr>
<th>Height (ft)</th>
<th>Kz</th>
<th>( q_z ) (lb/ft(^2))</th>
<th>( p ) (lb/ft(^2))</th>

</table>

Procedure Used by STAAD.Pro for Calculating the Equivalent Joint Load from incident Wind Pressure

1. Form closed panels. A closed panel is a region whose boundary consists entirely of members or of members and the ground surface.
2. Find the center of gravity of each of the panels.
3. For each panel, draw straight lines from the center of gravity (CG) to the midpoint of the members that form the panel boundary. So, the panel region will now contain several quadrilaterals whose two sides are made of portions of the respective members (or the ground) and the other two sides are lines going from the CG to the midpoint of the corresponding members.
4. The area contained in any quadrilateral is allocated as the influence area for the node located at the meeting point of two members.
5. Multiply the influence area by the average wind pressure contained inside the influence area and by the exposure factor for the node. This will yield the concentrated wind force for the joint.

Calculation of Equivalent Joint Loads
Evidently, members AB, BG and GH along with the ground surface, forms the closed panel ABGH. P is the CG of the panel, located at 5 ft away from line AH and 5 ft away from line AB. So, influence area for joint A is AJPI. Area of AJPI = 5 × 5 = 25 ft².

Average intensity of wind pressure in this area \( AJPI = 13.25 \text{ lb/ft}^2 \)

Exposure factor = 1 (for all the nodes in the model)

So, equivalent joint load in joint A = Influence area × Avg. Intensity of wind pressure × Exposure

\[
= 25 \times 13.25 \times 1 = 331.2 \text{ lb} = 0.33 \text{ kip}
\]

Joint B will be under influence of influence area BKQU and BKPJ. Area of each of those influence areas = 5 × 5 = 25 ft². Intensity of wind pressure in each of those influence areas = 13.25 lb/ft². Hence, equivalent joint load for each of those areas = 0.33 kip

So, total joint load in joint B = 0.331 × 2 = 0.662 kip

Joint C will be under influence area CVQU. Average intensity of wind pressure in this influence area will be

\[
= (13.25 + 14.1284837) / 2 = 13.69 \text{ lb/ft}^2
\]

Exposure Factor = 1

Area of CVQU = 5 × 5 = 25 ft²

Hence, equivalent joint load at joint C = 342.2 lb ≈ 0.343 kip

Joint W will be under influence of area WXRZ and WVQZ. Area of both of these = 25 ft². Average intensity of wind pressure in both of the influence areas = Average intensity of wind in the influence area CVQU = 13.68 lb/ft². Hence, equivalent joint load on joint W = 2 × 0.343 kip = 0.686 kip
Joint G will be under the influence of area GZRM, GZQK, GMSL and GKPL. Area of each of these influence areas = 5 × 5 = 25 ft². Average intensity of wind pressure in each of these areas = average intensity of wind pressure in area BKQU = 13.25 lb/ft². Hence, equivalent joint load on joint G = 4 × 0.33 = 1.32 kip

Joint H will be under the influence of areas HLPI and HTSL. Area of each of those influence areas = 5 × 5 = 25 ft². Intensity of wind pressure in each of those influence areas = 13.25 lb/ft². Hence, equivalent joint load on joint H = 2 × 0.33 = 0.66 kip

Since the structure is symmetric about the line WH, the equivalent joint load at D = equivalent joint load at C = 0.34 kip, equivalent joint load at B = equivalent joint load at E = 0.66 kip and equivalent joint load at A = equivalent joint load at F = 0.33 kip.

FINISH
V. ASCE 7-02 Wind Load Generation on Building

Verify the windward loads due to wind on a portion of a building structure calculated per the ASCE 7-02 specification.

Details

The wind load is calculated for a rigid building structure using the procedure for MWFRS of enclosed buildings (ASCE 7-02, Section 6.5.12.2.1). The following assumptions and parameters apply:

- Flat roof type
- Category II building (Table 1-1)
- Basic wind speed = 108 mph
- Structure type of “building”
- Exposure Category B
- Do not consider wind speed-up over hills or escarpments
- Building height = 40 ft
- Building length along the wind direction, $L = 10$ ft
- Building width normal to wind direction, $B = 20$ ft
- Natural frequency of structure = 2 Hz (i.e., a “rigid” building per Section 6.2)
- Damping ratio = 0.05
- Enclosed building (per Section 6.2)

Calculate the resulting joint loads on the windward side due to wind along the X axis at the upper wall of one segment of the building.
Validation

Importance factor, $I = 1.0$ (Table 6-1)

The velocity pressure exposure coefficients ($K_z$) are calculated per the formulae given in Table 6-3:

$$K_z = \begin{cases} 
2.01\left(\frac{15}{z_g}\right)^{2/\alpha} & \text{for } z < 15 \text{ ft} \\
2.01\left(\frac{z}{z_g}\right)^{2/\alpha} & \text{for } 15 \text{ ft} \leq z \leq z_g 
\end{cases}$$

(Table 6-3)

where

$$\alpha = 7$$

(Table 6-2)
\[ z_g = 1,200 \text{ ft (Table 6-2)} \]

See the table below for the values of \( K^2 \) at discrete values of \( z \).

Directionality factor, \( K_d = 0.85 \) (Table 6-4)

Topographic factor, \( K_{zt} = 1.0 \) (i.e., not considered)

Velocity pressure, \( q_z \)

\[ q_z = 0.00256K_zK_{zt}K_dV^2I \quad \text{(Eq. 6-15)} \]

Mean roof height = height of the building = 30 ft. Refer to table below for calculation of \( q_z \) at the mean roof height.

Gust effect factor, \( G \)

\[ G = 0.925 \left( \frac{1 + 1.7g_qI}{1 + 1.7g_vI} \right) \quad \text{(Eq. 6-4)} \]

where

\[ g_q = g_v = 3.4 \]

\[ \bar{z} = \max \left( 0.6 \times h = 30 \text{ ft} \right) \]

\[ \epsilon = 1/3 \]

\[ L = 320 \text{ ft} \]

\[ c = 0.3 \]

\[ L_{\bar{z}} = \frac{L}{\bar{z}} = 309.99 \text{ ft} \]

\[ Q = \sqrt{\frac{1}{1 + 0.63 \left( \frac{B + h}{L \bar{z}} \right) 0.63}} = \sqrt{\frac{1}{1 + 0.63 \left( \frac{20 + 40}{309.99} \right) 0.63}} = 0.904 \]

\[ I_{\bar{z}} = c \left( \frac{33}{\bar{z}} \right)^{1/6} = 0.305 \]

Therefore, \( G = 0.925 \left( \frac{1 + 1.7 \times 3.4 \times 0.305 \times 0.904}{1 + 1.7 \times 3.4 \times 0.305} \right) = 0.8683 \)

External pressure coefficient, \( C_p = 0.8 \) for windward per Fig. 6-6.

The external design pressure, \( p = q_hGC_p \)

The internal pressure coefficient, \( GC_{pi} = -0.18 \) for partially enclosed buildings per Figure 6-5.

The internal design pressure, \( p_i = q_i(GC_{pi}) = 19.30 \times -0.18 = -3.47 \text{ lb/ft}^2 \)

where

\[ q_i = \text{the velocity pressure evaluated at the building height, } h, \]

\[ q_h = 0.00256K_zhK_{zt}K_dV^2I = 0.00256(0.761)(1.0)(0.85)(108)^2(1.0) = 19.30 \text{ lb/ft}^2 \]

The design wind pressure, \( p \), is then calculated as:

\[ p = q_zGC_p \cdot q_i(GC_{pi}) \quad \text{(Eq. 6-17)} \]

#### Load on Nodes 1 and 9

Assume that the ground ($Y = 0'$) acts as a bounded edge for the wind load acting on the exterior of the building. This edge transfers load to the columns.

![Tributary area for nodes 1 and 9](image)

Wind pressure at half-way between this node and level above ($5'$) = 13.61 lb/ft².

\[ F = (10 \text{ ft} / 2) \times (10 \text{ ft} / 2) \times 13.61 \text{ lb/ft}^2 \times (10)^2 = 0.34 \text{ kips} \]

#### Load on Node 5

![Tributary area for node 5](image)

Wind pressure at half-way between this node and level above ($5'$) = 13.61 lb/ft².
Load on Nodes 2 and 10

\[ F = \left( \frac{10 \text{ ft}}{2} \right) \times (10 \text{ ft}) \times 13.60 \text{ lb/ft}^2 (10)^{-3} = 0.68 \text{ kips} \]

Load on Node 6

\[ F = (10 \text{ ft} \times 10 \text{ ft}) \times 13.61 \text{ lb/ft}^2 (10)^{-3} = 1.36 \text{ kips} \]

Load on Nodes 13 and 17

Wind pressure at half-way between this node and level above (5') = 13.61 lb/ft^2. This pressure is constant below this height.

\[ F = \left( \frac{10 \text{ ft}}{2} \right) \times (10 \text{ ft}) \times 13.61 \text{ lb/ft}^2 (10)^{-3} = 0.68 \text{ kips} \]
Figure 452: Tributary area for nodes 13 and 17

Wind pressure at half-way between this node and level below (15') = 13.61 lb/ft².
Wind pressure at half-way between this node and level above (25') = 15.20 lb/ft².

\[ F = (10 \text{ ft} / 2) \times (10 \text{ ft} / 2) \times (13.61 \text{ lb/ft}^2 + 15.20 \text{ lb/ft}^2) (10)^{-3} = 0.72 \text{ kips} \]

Load on Node 15

Figure 453: Tributary area for node 15

Wind pressure at half-way between this node and level below (15') = 13.61 lb/ft².
Wind pressure at half-way between this node and level above (25') = 15.20 lb/ft².

\[ F = (10 \text{ ft} / 2) \times (10 \text{ ft}) \times (13.61 \text{ lb/ft}^2 + 15.20 \text{ lb/ft}^2) (10)^{-3} = 1.44 \text{ kips} \]

Load on Node 19
Verification Examples

V.06 Loading

Wind pressure at half-way between this node and level below (25') = 15.20 lb/ft².
Wind pressure at half-way between this node and level above (35') = 16.38 lb/ft².

\[ F = \left( \frac{10 \text{ ft}}{2} \right) \times \left( \frac{10 \text{ ft}}{2} \right) \times (15.20 \text{ lb/ft}^2 + 16.38 \text{ lb/ft}^2) \times (10)^{-3} = 0.79 \text{ kips} \]

**Load on Node 21**

Wind pressure at half-way between this node and level below (25') = 15.20 lb/ft².
Wind pressure at half-way between this node and level above (35') = 16.38 lb/ft².

\[ F = (10 \text{ ft}) \times \left( \frac{10 \text{ ft}}{2} \right) \times (15.20 \text{ lb/ft}^2 + 16.38 \text{ lb/ft}^2) \times (10)^{-3} = 1.58 \text{ kips} \]

**Load on Nodes 25 and 29**
Wind pressure at roof level (40') = 16.89 lb/ft².

\[ F = (10 \text{ ft} / 2) \times (10 \text{ ft} / 2) \times 16.89 \text{ lb/ft}^2 \times (10)^{-3} = 0.42 \text{ kips} \]

Load on Node 27

Wind pressure at roof level (40') = 16.89 lb/ft².

\[ F = (10 \text{ ft}) \times (10 \text{ ft} / 2) \times 15.04 \text{ lb/ft}^2 \times (10)^{-3} = 0.84 \text{ kips} \]

Verify the calculated wind pressure at the mid-height (4.5 m) on a structure per the Chinese GB 50009-2012 code.

Problem
This problem determines the pressures applied to a rectangular building at various significant heights, from a wind force that is flowing in the positive X direction (i.e. from X= -infinity to X= + infinity).

Note: STAAD.Pro generates loading on the windward face, sidewalls, and also leeward face of the buildings.
A 9 m tall, two story structure is subject to a wind load along the along the global X direction. The building width (along the Z direction, perpendicular to wind) is 6 m. The building length (along the X direction, parallel to wind) is 10 m. The structure is a closed structure. The building is located in Beijing City in the Beijing province.

The shape factor, \( \mu_s = 0.8 \). This is for the left face of the structure and the direction of wind is from left (+X). (+X) means that the wind is originating along the X axis pointing in the +X direction. The plan section type of the structure is rectangle. Refer to table 8.3.1 of the Chinese load code GB 50009-2012.

The reference wind pressure, \( w_0 = 0.45 \, \text{kN/m}^2 \). Refer to table E.5 in the Chinese load code GB 5009-2012. The roughness type is “C”.

Wind-induced vibration along-wind is not considered (\( \beta_z = 1 \)).

**Calculations**

Calculate the modified wind shape factor:

\[
\mu'_s = \mu_s \times \beta_z = 0.8 \times 1.0 = 0.8
\]

Calculate the modified wind height factor:

Per Table 8.2.1 of GB 50009-2012, at a height of \( z = 4.5 \) m for a roughness type of “A”, \( \mu_z = 1.09 \)

\[
\mu'_z = \mu_z \times \beta_z = 1.09 \times 1.0 = 1.09
\]

There is no modification for the reference wind pressure, so \( w_0 = 0.45 \, \text{kN/m}^2 \)

The origin value of reference wind pressure is taken from table E.5 in the Chinese load code GB 50009-2012, \( w_{0,\text{origin}} b = 0.45 \)

Calculate the wind pressure characteristic value, \( w_k \) (wind intensity at height, \( z = 4.5 \) m):

\[
w_k = \beta_z \mu'_z w_0 = 1 \times 1.09 \times 0.45 = 0.491 \, \text{kN/m}^2
\]

The height factor for \( z = 9 \) is determined by linear interpolation between \( z = 5 \) (\( \mu_z = 1.09 \)) and \( z = 10 \) (\( \mu_z = 1.28 \)):

\[
\mu_z = 1.24
\]

Calculate the wind pressure characteristic value, \( w_k \) (wind intensity at height, \( z = 9 \) m):

\[
w_k = \beta_z \mu'_z w_0 = 1 \times 1.24 \times 0.45 = 0.558 \, \text{kN/m}^2
\]

**Comparison**

V. IS 875 (Pt 3) 2015 WL Generation on Rectangular Clad Bldg 1

Determine the lateral wind loads on a three-story clad building per the IS 875 (Part 3): 2015 code.
Details

- Building length along wind when wind blow +X or -X direction, \( L_x = 9 \text{ m} \)
- Building length across wind when wind blow +X or -X direction, \( L_z = 12 \text{ m} \)
- Building length along wind when wind blow +Z or -Z direction, \( L_z = 12 \text{ m} \)
- Building length across wind when wind blow +Z or -Z direction, \( L_x = 9 \text{ m} \)
- Building Height, \( h = 9 \text{ m} \)
- Basic Wind Speed, \( V_b = 47 \text{ m/s} \) (Location Agra as per ANNEX A of IS 875 3:2015)
- Terrain Category: Terrain Category 1 (Cl 6.3.2.1 as per IS 875 3:2015)
- Risk Coefficient Factors, \( k_1 = 1.0 \) (All general buildings from Table 1 of IS 875 3:2015)
- Topography Factor, \( k_3 = 1.0 \) (Up wind slope (\( \theta \)) below 3 degree from Cl 6.3.3.1 of IS 875 3:2015)
- Importance Factor for Cyclonic Region, \( k_4 = 1.0 \) (All other Structures from Cl 6.3.4 of IS 875 3:2015)
- Wind Directionality Factor for Buildings, \( K_d = 0.9 \) (From Cl 7.2.1 of IS 875 3:2015)
- Area Averaging Factor, \( K_a = 0.9 \) (From Table 4 of IS 875 3:2015)
- Combination Factor, \( K_c = 0.9 \) (From Cl 7.3.3.13 of IS 875 3:2015)

Validation

Calculate the design wind speed and pressure:

There is no variation in either for the first 10 m in height, thus the values are constant for the height of the building.

- Terrain & height factor, \( k_2 \) (from Table 2 of IS 875 (Part 3): 2015) = 1.05
The design wind speed:

\[ V_z = V_b \times k_1 \times k_2 \times k_3 \times k_4 = 47 \times 1(1.0) \times 1(1.05) \times 1(1.0) = 49.35 \]  
(Cl 6.3)

Wind pressure at height, \( z = 10 \) m:

\[ P_z = 0.6 \times V_z^2 = 0.6 \times (49.35)^2 = 1.461 \text{ kN/m}^2 \]  
(Cl. 7.2)

Design wind pressure:

\[ P_d = K_d \times K_a \times K_c \times P_z = (0.9) \times (0.9) \times (0.9) \times 1.461 = 1.065 \text{ kN/m}^2 \]  
(Cl 7.2)

Check the minimum wind pressure: \( 0.7 \times P_z = 1.023 < P_d \), OK.

Internal pressure coefficient:

- \( C_{pi} = 0.2 \) (Positive internal Coefficient as the building opening not more than 5 % From Cl 7.3.2.1 of IS 875 3:2015)
- \( C_{pi} = -0.2 \) (Negative internal Coefficient as the building opening not more than 5 % From Cl 7. 3.2.1 of IS 875 3:2015)

External Pressure Coefficient when wind Positive (+X) Direction (From Table 5 of IS 875 3:2015):

- External Pressure Coefficient wind along +X on face A, \( C_{pe} = 0.7 \)
- External Pressure Coefficient wind along +X on face B, \( C_{pe} = -0.25 \)
- External Pressure Coefficient wind along +X on face C, \( C_{pe} = -0.6 \)
- External Pressure Coefficient wind along +X on face D, \( C_{pe} = -0.6 \)

Calculate the equivalent joint loads:

\[ \text{equiv joint load} = \text{influence area} \times \text{avg. intensity of wind pressure} \times \text{net pressure coefficient} \]

**Face A (From +X Direction)**

The positive wind load is acting towards face A as per clause 7.3.1 of IS 875 (Part 3) : 2015 and the equivalent joint loads are calculated as follows

- At joint 1 (joints 13, 33, 34, 45, 46, 66, 78 similar)
  - For Positive Cpi, Equivalent joint load = \( 2.25 \text{ m}^2 \times 1.065 \text{ kN/m}^2 \times [0.7 - (+0.2)] = 1.198 \text{ kN} \)
  - For Negative Cpi, Equivalent joint load= \( 2.25 \text{ m}^2 \times 1.065 \text{ kN/m}^2 \times [0.7 - (-0.2)] = 2.157 \text{ kN} \)
- At joint 5 (joints 9, 17, 29, 37, 38, 41, 42, 50, 62, 70, 74 similar)
  - For Positive Cpi, Equivalent joint load = \( 4.5 \text{ m}^2 \times 1.065 \text{ kN/m}^2 \times [0.7 - (+0.2)] = 2.397 \text{ kN} \)
  - For Negative Cpi, Equivalent joint load= \( 4.5 \text{ m}^2 \times 1.065 \text{ kN/m}^2 \times [0.7 - (-0.2)] = 4.314 \text{ kN} \)
- At joint 21 (joints 25, 54, 58 similar)
  - For Positive Cpi, Equivalent joint load = \( 9 \text{ m}^2 \times 1.065 \text{ kN/m}^2 \times [0.7 - (+0.2)] = 4.79 \text{ kN} \)
  - For Negative Cpi, Equivalent joint load= \( 9 \text{ m}^2 \times 1.065 \text{ kN/m}^2 \times [0.7 - (-0.2)] = 8.62 \text{ kN} \)

**Face B (From +X Direction)**

The negative wind load is acting away from face B as per clause 7.3.1 of IS 875 (Part 3) : 2015 and the equivalent joint loads are calculated as follows

- At joint 4 (joints 16, 68, 80 similar)
  - For Positive Cpi, Equivalent joint load = \( 2.25 \text{ m}^2 \times 1.065 \text{ kN/m}^2 \times [(-0.25) - (+0.2)] = -1.079 \text{ kN} \)
  - For Negative Cpi, Equivalent joint load= \( 2.25 \text{ m}^2 \times 1.065 \text{ kN/m}^2 \times [(-0.25) - (-0.2)] = -0.12 \text{ kN} \)
At joint 8 (joints 12, 20, 32, 36, 48, 52, 64, 72, 76 similar)

- For Positive Cpi, Equivalent joint load = 4.5 m² × 1.065 kN/m² × [(-0.25) – (+0.2)] = -2.157 kN
- For Negative Cpi, Equivalent joint load = 4.5 m² × 1.065 kN/m² × [(-0.25) – (-0.2)] = -0.24 kN

At joint 24 (joints 28, 40, 44, 56, 60 similar)

- For Positive Cpi, Equivalent joint load = 9 m² × 1.065 kN/m² × [(-0.25) – (+0.2)] = -4.314 kN
- For Negative Cpi, Equivalent joint load = 9 m² × 1.065 kN/m² × [(-0.25) – (-0.2)] = -0.479 kN

Face C (Wind From +X Direction)
The negative wind load is acting away from face C as per clause 7.3.1 of IS 875 (Part 3) : 2015 and the equivalent joint loads are calculated as follows

- At joint 1 (joints 4, 13, 16 similar)

  - For Positive Cpi, Equivalent joint load = 2.25 m² × 1.065 kN/m² × [(-0.6) – (+0.2)] = -1.917 kN
  - For Negative Cpi, Equivalent joint load = 2.25 m² × 1.065 kN/m² × [(-0.6) – (-0.2)] = -0.959 kN

- At joint 2 (joints 3, 5, 8, 9, 12, 14, 15 similar)

  - For Positive Cpi, Equivalent joint load = 4.5 m² × 1.065 kN/m² × [(-0.6) – (+0.2)] = -3.835 kN
  - For Negative Cpi, Equivalent joint load = 4.5 m² × 1.065 kN/m² × [(-0.6) – (-0.2)] = -1.917 kN

- At joint 6 (joints 7, 10, 11 similar)

  - For Positive Cpi, Equivalent joint load = 9 m² × 1.065 kN/m² × [(-0.6) – (+0.2)] = -7.668 kN
  - For Negative Cpi, Equivalent joint load = 9 m² × 1.065 kN/m² × [(-0.6) – (-0.2)] = -3.834 kN

Face D (From +X Direction)
The negative wind load is acting away from face D as per clause 7.3.1 of IS 875 (Part 3) : 2015 and the equivalent joint loads are calculated as follows

- At joint 33 (joints 34, 45, 46, 66, 68, 78, 80 similar)

  - For Positive Cpi, Equivalent joint load = 2.25 m² × 1.065 kN/m² × [(-0.6) – (+0.2)] = -1.917 kN
  - For Negative Cpi, Equivalent joint load = 2.25 m² × 1.065 kN/m² × [(-0.6) – (-0.2)] = -0.959 kN

- At joint 37 (joints 38, 41, 42, 67, 70, 72, 74, 76, 79 similar)

  - For Positive Cpi, Equivalent joint load = 4.5 m² × 1.065 kN/m² × [(-0.6) – (+0.2)] = -3.835 kN
  - For Negative Cpi, Equivalent joint load = 4.5 m² × 1.065 kN/m² × [(-0.6) – (-0.2)] = -1.917 kN

- At joint 71 (joint 75 similar)

  - For Positive Cpi, Equivalent joint load = 9 m² × 1.065 kN/m² × [(-0.6) – (+0.2)] = -7.668 kN
  - For Negative Cpi, Equivalent joint load = 9 m² × 1.065 kN/m² × [(-0.6) – (-0.2)] = -3.834 kN

#### V. IS 875 (Pt 3) 2015 WL Generation on Rectangular Clad Bldg 2

Verify the calculated wind pressure on an edge node on a clad building per the IS 875 (Part 3): 2015 code.

**Details**

The following structure:
• Building length along wind when wind blow +X or -X direction, $L_x = 11.5 \text{ m}$
• Building length across wind when wind blow +X or -X direction, $L_z = 21 \text{ m}$
• Building length along wind when wind blow +Z or -Z direction, $L_x = 21 \text{ m}$
• Building length across wind when wind blow +Z or -Z direction, $L_z = 11.5 \text{ m}$
• Building Height, $h = 30 \text{ m}$
• Basic Wind Speed, $V_b = 33 \text{ m/s}$ (Location: Bengaluru; as per Annex A of IS 875 3:2015)
• Terrain Category: Terrain Category 2 (Cl 6.3.2.1 as per IS 875 3:2015)
• Risk Coefficient Factors, $k_1 = 1.05$ (All general buildings from Table 1 of IS 875 3:2015)
- Topography Factor, \( k_3 = 1.15 \) (Up wind slope (\( \Theta \)) below 3 degree from Cl 6.3.3.1 of IS 875 3:2015)
- Importance Factor for Cyclonic Region, \( k_4 = 1.0 \) (All other Structures from Cl 6.3.4 of IS 875 3:2015)
- Wind Directionality Factor for Buildings, \( K_d = 1 \) (From Cl 7.2.1 of IS 875 3:2015)
- Area Averaging Factor, \( K_a = 0.95 \) (From Table 4 of IS 875 3:2015)
- Combination Factor, \( K_c = 0.9 \) (From Cl 7.3.3.13 of IS 875 3:2015)

**Validation**

</table>

Internal Pressure Coefficient per Cl 7.3.2.2 of IS 875 3:2015 for buildings with openings between 5 and 20%:
- \( C_{pi} = 0.5 \) (positive internal coefficient)
- \( C_{pi} = -0.5 \) (negative internal coefficient)

Node 243 is at an elevation of 18 m, thus the average intensity of wind pressure in this area, \( P_{d, z=18} = 0.919 \) kN/m².

Tributary Area of Node 243
For a given panel, draw straight lines from the center of gravity (CG) to the midpoint of the members. So, the panel region will now contain several quadrilaterals whose two sides are made of portions of the respective members (or the ground) and the other two sides are lines going from the CG to the midpoint of the corresponding members.

Points A and B are the midpoints of members 473 and 22, respectively. Points A and B for a closed panel with the CG. Further, point 243 is located along segment A-B, so in this case the quadrilateral reduced to a triangle. So, the influence area for joint 243 is A-243-B-CG, which has an area of:

\[ A_{243} = \frac{3 \times 3}{2} = 4.5 \text{ m}^2 \]

**Positive X Direction**

The positive wind load is acting towards face A as per clause 7.3.1 of IS 875 (Part 3) : 2015 and the equivalent joint loads are calculated as follows:

External pressure coefficient for wind in the +X direction (from Table 5 of IS 875 3:2015):

\[
\frac{3}{2} < \frac{h}{w} = \frac{30}{11.5} = 2.6 < 6 \\
\frac{3}{2} < \frac{l}{w} = \frac{21}{11.5} = 1.8 < 4
\]

- External Pressure Coefficient wind along +X on face A, \( C_{pe} = 0.7 \)
- External Pressure Coefficient wind along +X on face B, \( C_{pe} = -0.4 \)
- External Pressure Coefficient wind along +X on face C, \( C_{pe} = -0.7 \)
Verification Examples
V.06 Loading

- External Pressure Coefficient wind along +X on face D, \( C_{pe} = -0.7 \)

The equivalent joint loads are:
- For Positive Cpi, equivalent joint load = \( 4.5 \, m^2 \times 0.919 \, kN/m^2 \times [0.7 - (+0.5)] = 0.83 \, kN \)
- For Negative Cpi, equivalent joint load = \( 4.5 \, m^2 \times 0.919 \, kN/m^2 \times [0.7 - (-0.5)] = 4.96 \, kN \)

**Negative X Direction**
- For Positive Cpi, equivalent joint load = \( 4.5 \, m^2 \times 0.919 \, kN/m^2 \times [-0.4 - (+0.5)] = 3.72 \, kN \)
- For Negative Cpi, equivalent joint load = \( 4.5 \, m^2 \times 0.919 \, kN/m^2 \times [-0.4 - (-0.5)] = 0.41 \, kN \)

**Positive Z Direction**
- For Positive Cpi, equivalent joint load = \( 4.5 \, m^2 \times 0.919 \, kN/m^2 \times [-0.5 - (+0.5)] = 4.13 \, kN \)
- For Negative Cpi, equivalent joint load = \( 4.5 \, m^2 \times 0.919 \, kN/m^2 \times [-0.5 - (-0.5)] = 0 \, kN \)

**Negative Z Direction**
- For Positive Cpi, equivalent joint load = \( 4.5 \, m^2 \times 0.919 \, kN/m^2 \times [-0.5 - (+0.5)] = 4.13 \, kN \)
- For Negative Cpi, equivalent joint load = \( 4.5 \, m^2 \times 0.919 \, kN/m^2 \times [-0.5 - (-0.5)] = 0 \, kN \)

**STAAD.Pro**

**3681 User Manual**
Evaluate the equivalent joint loads for a closed structure subjected to wind loads.

Details

A structure lying in YZ plane is composed of three members and is subjected to wind load from (+X) direction (i.e., out-of-plane). Those three members, along with the ground surface, form a closed panel. The wind load incident on that panel is converted to equivalent joint loads incident on the nodes by the program.

The exposure factor, $e$, for the structure is 0.85.

Validation

Determine CG of the Wind Area

Naming the nodal points A, B, C, and D, divide the area into two sub-areas: a rectangle and a triangle. The division is taken at the mid-point of member 1, which is at the same Y ordinate as node 3 (point B).

Area of the triangle ABE = $\frac{1}{2} \times \text{base} \times \text{height} = \frac{1}{2} \times (10\text{m}) \times (10\text{m}) = 50 \text{ m}^2$

CG of triangle ABE: $\bar{X}_{ABE} = \frac{1}{3} \times 10 = 3.33 \text{ m}$, $\bar{Y}_{ABE} = 10 + \frac{1}{3} \times 10 = 13.33 \text{ m}$
Area of rectangle BCDE = $10\, m \times 10\, m = 100\, m^2$

CG of rectangle BCDE: $X_{BCDE} = \frac{1}{2}10 = 5\, m$, $Y_{BCDE} = \frac{1}{2}10 = 5\, m$

CG of total area ABCD: $X = \frac{50(3.33) + 100(5)}{50 + 100} = 4.44\, m$, $Y = \frac{50(13.33) + 100(5)}{50 + 100} = 7.77\, m$

The CG is labeled point P.

The influence area of each joint is then take as the midpoint of the connecting members to this CG. Label the midpoints of each member E, Q, and J. The point at support level between nodes 1 and 2 is labeled K.

Equivalent Joint Load on Node 2 (A)

The influence area for node 2 is the shape formed by points A, Q, P, and E. Notice that this area can be decomposed into a trapezoid and two triangles. Also notice that this area has two different wind pressures, above and below $y = 10\, m$ (which coincides with line EB). Label a point on line AE with the same $Y$ coordinate as Q as N.

Determine the $Z$ coordinate of where line EB intersects line PQ and label this point M.
slope of \( PQ = \frac{15 - 7.77}{5 - 4.44} = 13.0 \)

\( z = 4.44 + \frac{10 - 7.77}{13} = 4.615 \text{ m} \)

The sub-areas of AQPE:

\[ A_{EMP} = 0.5 \times (10 - 7.77) \times 4.615 = 5.13 \text{ m}^2 \]

\[ A_{NQME} = 0.5 \times (5 + 4.615) \times 5 = 24.04 \text{ m}^2 \]

\[ A_{ANQ} = 0.5 \times 5 \times 5 = 12.5 \text{ m}^2 \]

The equivalent joint load, \( F \), is calculated as \( \text{Influence area, } A, \times \text{avg. wind pressure, } p \times \text{exposure factor, } e \)

\[ F = 0.85 \times [2 \times (5.13) + 3 \times (24.04 + 12.5)] = 101.90 \text{ kN} \]

**Equivalent Joint Load on Node 3 (B)**

The influence area for node 3 is the shape formed by points B, J, P and Q. Label a point on line BJ with the same Y coordinate as P as point V.
The sub-areas of BJPQ:

\[ A_{BMQ} = 0.5 \times (10 - 4.615) \times 5 = 13.46 \text{ m}^2 \]
\[ A_{BVPM} = 0.5 \times ((10 - 4.615) + (10 - 4.44)) \times (10 - 7.77) = 12.2 \text{ m}^2 \]
\[ A_{VJP} = 0.5 \times (10 - 4.44) \times (7.77 - 5) = 7.72 \text{ m}^2 \]

The equivalent joint load,

\[ P = 0.85 \times [2 \times (12.2 + 7.72) + 3 \times (13.46)] = 67.85 \text{ kN} \]

**Equivalent Joint Load on Node 4 (C)**

The influence area for node 4 is the shape formed by points C, K, P, and J. The change in pressure magnitude is at the same Y coordinate as point J. Label the point on line ED with this same Y coordinate as point R. Determine the Z coordinate of where line RJ intersects line PK and label this point W.

\[ \text{slope of PK} = \frac{(7.77)}{(5 - 4.44)} = 14.0 \]
\[ z = 4.44 + \frac{(7.77 - 5)}{14} = 4.643 \text{ m} \]
The sub-areas of CKPJ:

\[ A_{\text{JWP}} = 0.5 \times (7.77 - 5) \times (10 - 4.643) = 7.44 \, \text{m}^2 \]

\[ A_{\text{BVPM}} = 0.5 \times [(10 - 4.643) + 5] \times 5 = 25.89 \, \text{m}^2 \]

The equivalent joint load,

\[ F = 0.85 \times [1.5 \times (25.89) + 2 \times (7.44)] = 45.66 \, \text{kN} \]

**Equivalent Joint Load on Node 1 (D)**

The influence area for node 1 is the shape formed by points D, E, P, and K. Label a point on line DE with the same Y coordinate as P as point L.

The sub-areas of DEPK:
\[
A_{\text{LEP}} = 0.5 \times (10 - 7.77) \times 4.44 = 4.94 \text{ m}^2
\]
\[
A_{\text{RLPW}} = 0.5 \times [4.44 + 4.643] \times (7.77 - 5) = 12.62 \text{ m}^2
\]
\[
A_{\text{DRWK}} = 0.5 \times [4.643 + 5] \times 5 = 24.11 \text{ m}^2
\]
The equivalent joint load,
\[
F = 0.85 \times [1.5 \times (24.11) + 2 \times (4.94 + 12.62)] = 60.59 \text{ kN}
\]

STAAD.Pro 3688 User Manual
Evaluate the equivalent joint loads for a closed structure subjected to wind loads.

Details

A structure lying in YZ plane is composed of three members and is subjected to wind load from (+X) direction (i.e., out-of-plane). Those three members, along with the ground surface, form a closed panel. The wind load incident on that panel is converted to equivalent joint loads incident on the nodes by the program.

The exposure factor, e, for the structure is 0.85.

**Note:** This structure is similar to that in V.Wind On Closed Structure 1 (on page 3682) with an added node at the mid-point of the left column (Point E).
### Validation

**Determine CG of the Wind Area**

Naming the nodal points A, B, C, D, and E, divide the area into two sub-areas: a rectangle and a triangle. The division is taken at nodes 5 and 3 (points E and B).

Area of the triangle $\text{ABE} = \frac{1}{2} \times \text{base} \times \text{height} = \frac{1}{2} \times (10\text{m}) \times (10\text{m}) = 50 \text{ m}^2$

CG of triangle $\text{ABE}$: $\overline{X}_{\text{ABE}} = \frac{1}{3} 10 = 3.33 \text{ m}$, $\overline{Y}_{\text{ABE}} = 10 + \frac{1}{3} 10 = 13.33 \text{ m}$

### Table 550: Wind intensity variation with height above ground

<table>
<thead>
<tr>
<th>Height (m)</th>
<th>Intensity of wind load (kg/m²)</th>
</tr>
</thead>
<tbody>
<tr>

<td>1.5</td>
</tr>
<tr>
<td>5m - 10 m</td>
<td>2</td>
</tr>
<tr>
<td>10 m - 20 m</td>
<td>3</td>
</tr>
</tbody>
</table>
Area of rectangle BCDE = 10 m × 10 m = 100 m²

CG of rectangle BCDE: \( \bar{X}_{BCDE} = \frac{1}{2} \times 10 = 5 \text{ m}, \ \bar{Y}_{BCDE} = \frac{1}{2} \times 10 = 5 \text{ m} \)

CG of total area ABCD: \( \bar{X} = \frac{50(3.33) + 100(5)}{50 + 100} = 4.44 \text{ m}, \ \bar{Y} = \frac{50(13.33) + 100(5)}{50 + 100} = 7.77 \text{ m} \)

The CG is labeled point P.

The influence area of each joint is then taken as the midpoint of the connecting members to this CG. Label the midpoints of each member R, N, Q, and J. The point at support level between nodes 1 and 2 is labeled K.

Equivalent Joint Load on Node 2 (A)

The influence area for node 2 is the shape formed by points A, Q, P, and N. Notice that this area can be decomposed into a trapezoid and two triangles. Also notice that this area has two different wind pressures, above and below \( y = 10 \text{ m} \) (which coincides with line EB).

Determine the Z coordinate of where line EB intersects line NP and label this point S.

\[
\text{slope of NP} = \frac{15 - 7.77}{4.44} = 1.625
\]
Determine the Z coordinate of where line EB intersects line PQ and label this point M.

\[
z = 4.44 - \frac{(10 - 7.77)}{1.625} = 4.615 \text{ m}
\]

\[
\text{slope of PQ} = \frac{(15 - 7.77)}{(5 - 4.44)} = 13.0
\]

\[
z = 4.44 + \frac{(10 - 7.77)}{13} = 3.077 \text{ m}
\]

The sub-areas of AQPN:

\[
A_{SMP} = 0.5 \times (10 - 7.77) \times (4.615 \text{ } - 3.077) = 1.71 \text{ m}^2
\]

\[
A_{NQMS} = 0.5 \times (5 + 4.615 \text{ } - 3.077) \times 5 = 16.35 \text{ m}^2
\]

\[
A_{ANQ} = 0.5 \times 5 \times 5 = 12.5 \text{ m}^2
\]

The equivalent joint load, \( F \), is calculated as \( \text{Influence area, } A, \times \text{ avg. wind pressure, } p \times \text{ exposure factor, } e \)

\[
F = 0.85 \times [2 \times (1.71) + 3 \times (16.35 + 12.5)] = 76.47 \text{ kN}
\]

The influence area for node 3 is the shape formed by points B, J, P and Q. Label a point on line BJ with the same Y coordinate as P as point V.
The sub-areas of BQP:

$$A_{BMQ} = 0.5 \times (10 - 4.615) \times 5 = 13.46 \text{ m}^2$$

$$A_{BVPQ} = 0.5 \times [(10 - 4.615) + (10 - 4.44)] \times (10 - 7.77) = 12.2 \text{ m}^2$$

$$A_{VJP} = 0.5 \times (10 - 4.44) \times (7.77 - 5) = 7.72 \text{ m}^2$$

The equivalent joint load,

$$P = 0.85 \times [2 \times (12.2 + 7.72) + 3 \times (13.46)] = 67.85 \text{ kN}$$

**Equivalent Joint Load on Node 4 (C)**

The influence area for node 4 is the shape formed by points C, K, P, and J. The change in pressure magnitude is at the same Y coordinate as point J. Label the point on line ED with this same Y coordinate as point R. Determine the Z coordinate of where line RJ intersects line PK and label this point W.

- slope of PK = $$(7.77)/(5 - 4.44) = 14.0$$
- $$z = 4.44 + (7.77 - 5)/14 = 4.643 \text{ m}$$
The sub-areas of CKPJ:

\[ A_{JWP} = 0.5 \times (7.77 - 5) \times (10 - 4.643) = 7.44 \text{ m}^2 \]

\[ A_{BVPM} = 0.5 \times [(10 - 4.643) + 5] \times 5 = 25.89 \text{ m}^2 \]

The equivalent joint load,

\[ F = 0.85 \times [1.5 \times (25.89) + 2 \times (7.44)] = 45.66 \text{ kN} \]

**Equivalent Joint Load on Node 1 (D)**

The influence area for node 1 is the shape formed by points D, R, P, and K.

The sub-areas of DRPK:

\[ A_{RPW} = 0.5 \times (7.77 - 5) \times 4.643 = 6.45 \text{ m}^2 \]
\[ A_{\text{DRWK}} = 0.5 \times [4.643 + 5] \times 5 = 24.11 \text{ m}^2 \]

The equivalent joint load,
\[ F = 0.85 \times [1.5 \times (24.11) + 2 \times (6.17)] = 41.71 \text{ kN} \]

**Equivalent Joint Load on Node 5 (E)**

The influence area for node 5 is the shape formed by points N, P, and R. Label a point on line RE with the same Y coordinate as P as point L.

The sub-areas of NPR:
\[ A_{\text{NSE}} = 0.5 \times (5) \times 3.077 = 7.69 \text{ m}^2 \]
\[ A_{\text{ESPL}} = 0.5 \times [3.077 + 4.44] \times (10 - 7.77) = 8.36 \text{ m}^2 \]
\[ A_{\text{LPR}} = 0.5 \times (4.44) \times (7.77 - 5) = 6.17 \text{ m}^2 \]

The equivalent joint load,
\[ F = 0.85 \times [2 \times (8.36 + 6.17) + 3 \times (7.69)] = 44.31 \text{ kN} \]

### V. Wind On Open Structure

Validate the calculated member loads for an open structure subject to wind loading.

**Details**

A structure is subjected to wind loading from +X direction. The members are rectangular members with 500 mm × 500 mm in dimension. The diagonal member is also of same dimension but rotated at a beta angle value of 45°. Thus, the wind facing area of that member will be different than that of the other members.
Table 552: Variation of wind intensity over structure height

<td>3</td>
</tr>
</tbody>
</table>

Validation

When open structures are subjected to wind load, wind load incident on the structure is applied as uniformly distributed loads on the members along the projected axis (i.e., in PX/PY/PZ direction). Wind intensity multiplied by the effective area of the member facing the wind load gives the uniformly distributed member load on the member.

**Wind Load on Members 1,3, 6 & 8**

Wind intensity varies between the length of the member, so different parts of the member will be subjected to uniformly distributed loads of different magnitudes.

Let the midpoint of member 1 be K. So, AK = CK = 5 m
Up to Height 5 m (part AK)

Intensity of wind load = 1.5 kN/m²
Area of the member facing the wind = 0.5 m

\[ w_{AK} = 1.5 \times 0.5 = 0.75 \text{ kN/m} \]

Up to Height 10 m (part KB)

Intensity of wind load = 2 kN/m²
Area of the member facing the wind = 0.5 m

\[ w_{KB} = 2 \times 0.5 = 1 \text{ kN/m} \]

Due to same orientation, member load on member 3, 6, and 8 will also be same as that of member 1.

Wind Load on Member 9, 10, 11 & 12

Intensity of wind load = 3 kN/m²
Area of the member facing the wind = 0.5 m

\[ w = 3 \times 0.5 = 1.5 \text{ kN/m} \]

Due to same orientation, member load on member 10, 11, and 12 will also be same as that of member 9.

Wind Load on Member 4 & 5

Intensity of wind load = 2 kN/m²
Area of the member facing the wind = 0.5 m

\[ w = 2 \times 0.5 = 1.0 \text{ kN/m} \]

Due to same orientation, member load on member 5 will also be same as that of member 4.

Wind Load on Member 14 & 15

Intensity of wind load = 3 kN/m²
Area of the member facing the wind = 0.5 m

\[ w = 3 \times 0.5 = 1.5 \text{ kN/m} \]

Due to same orientation, member load on member 15 will also be same as that of member 14.

Wind Load on Member 2, 7, 13, & 16

These members are aligned along the +X axis. Since the structure is subjected to wind load from +X direction only, the area of those members facing the wind is zero. So, there will be no load due to wind on these members.

Wind Load on Member 17

Since the member is rotated at a beta angle of 45°, the area of the member facing the wind = \( 0.5 \text{ m} \times \cos 45° = 0.707 \text{ m} \)

Wind intensity varies between the length of the member, so different parts of the member will be subjected to uniformly distributed loads of different magnitudes.

Up to height 5m

Wind intensity = 1.5 kN/m²

\[ w = 1.5 \times 0.707 = 1.061 \text{ kN/m} \]

Up to height 10m
Wind intensity \( = 2 \, kN/m^2 \)
\( w = 2 \times 0.707 = 1.414 \, kN/m \)

Results

V. Column Buckling Factor

Determine the buckling factor for a pinned-pinned column subject to an axial load.

Details
A 30 ft tall column with pinned ends is subject to a 160 kip axial load. The section is a W10x45 with a modulus of elasticity of 29,730 ksi.

Validation
Critical elastic buckling capacity:

\[ P_{cr} = \frac{\pi^2EI}{\ell^2} \]

\[ P_{cr} = \frac{\pi^2(29,730)(248)/(30\times12)^2}{=} 561.5 \text{ k} \]

Buckling factor: \( P_{cr}/P = 561.5 / 160 = 3.509 \)

**CONVERGED**

V. Column Pushover Displacement

Compare theoretical solution to a pushover analysis to the STAAD.Pro solution.

**Reference**

Hand calculation.
Problem

Figure 468: Cantilever member model

A transverse load P is applied to a cantilever member and increased until the member fails.
Member length = 24 inch
Section = Wide flange W16X77
Material = Steel
Expected yield strength = 36 ksi

Results from STAAD.Pro

Note: Pushover analysis requires the STAAD.Pro Advanced Analysis license.
The analysis results are saved at an interval of 0.1 inch deflection of the cantilever tip. The following results are displayed in the Postprocessing workflow by selecting the Layouts > Pushover-Graphs tool in the Dynamics group on the Results ribbon tab.

Table 556: Tabular form of the different points in Capacity curve as reported by STAAD.Pro
Results from hand calculation

At Load Step 3

Equation of elastic deflection at cantilever tip:

\[ \delta_z = \frac{PL^3}{3EI} + \frac{PL}{EA'} \]

where

\[
\begin{align*}
P &= 57.837 \text{ kip} \\
L &= 24 \text{ in.} \\
E &= 29,000 \text{ ksi} \\
I &= 138.0 \text{ in.}^4 \\
G &= 11,154 \text{ ksi} \\
A' &= 10.4323 \text{ in.}^2
\end{align*}
\]

Thus elastic deformation:

\[ \delta_z = \frac{57.837 \times 24^3}{3 \times 29,000 \times 138} + \frac{57.837 \times 24}{11,154 \times 10.4323} = 0.066 + 0.012 = 0.078 \text{ in.} \]

At Load Step 13

Equation of elastic deflection at cantilever tip

\[ \delta_z = \frac{PL^3}{3EI} + \frac{PL}{EA'} \]

where

\[
\begin{align*}
P &= 79.479 \text{ kip} \\
L &= 24 \text{ in.} \\
E &= 29,000 \text{ ksi} \\
I &= 138.0 \text{ in.}^4 \\
G &= 11,154 \text{ ksi} \\
A' &= 10.4323 \text{ in.}^2
\end{align*}
\]

(The other values are as listed for Load Step 3)

Thus elastic deformation at cantilever tip:

\[ \delta_z = \frac{79.479 \times 24^3}{3 \times 29,000 \times 138} + \frac{79.479 \times 24}{11,154 \times 10.4323} = 0.092 + 0.016 = 0.108 \text{ in.} \]

Plastic rotation = 0.04 radian.

Since STAAD.Pro assumes small displacements (\(\sin \theta = \theta\)), plastic deformation at cantilever tip

\[ \delta_z \text{ plastic} = L \times \theta = 24 \times 0.04 = 0.96 \text{ inch} \]

Total deflection = \( \delta_z \text{ elastic} + \delta_z \text{ plastic} = 0.108 + 0.96 = 1.068 \text{ inch} \)
Comparison

V. Direct Analysis of a Beam

Verify the maximum bending moment and deflection of a beam using the direct analysis method.

Reference

Details

A 40' long, simply-supported beam is subject to a uniformly distributed load of 100 lbs/ft and axial compression of 100 kips. The section is a W10x60 ($I_z = 341 \text{ in}^4$).

Validation

The maximum moment and deflection both occur at mid-span.

**Maximum moment**

\[ M_{\text{MAX}} = M_0 \left[ \frac{2(\sec, u, \cdot, 1)}{u^2} \right] \]

where

\[ M_0 = \frac{wL^2}{8} = \frac{0.1(40)^2}{8} = 20 \text{ ft-k} \]

\[ u = \sqrt{\frac{PL^2}{4EI}} = \sqrt{\frac{100 \times (40)^2 \times (12)^2}{4 \times 29,000 \times 341}} = 0.763 \]

\[ \frac{2(\sec, u, \cdot, 1)}{u^2} = \frac{2\sec, (0.763,), \cdot, 1}{0.763^2} = 1.318 \]

Therefore, the maximum moment is: \( 20 \times 1.318 = 26.36 \text{ ft-k} \)

**Maximum deflection**

\[ \delta_{\text{MAX}} = \delta_0 \left[ \frac{12(2\sec \cdot u^2 \cdot 2)}{5u^4} \right] \]

where

\[ \delta_0 = \frac{5wL^4}{384EI} = \frac{5(0.1)(40)^4(12)^3}{384(29,000)(341)} = 0.582 \text{ in} \]

\[ \frac{12(2\sec \cdot u^2 \cdot 2)}{5u^4} = \frac{12(2\sec(0.763) \cdot (0.763)^2 \cdot 2)}{5(0.763)^4} = 1.310 \]

Therefore, the maximum deflection is: \( 0.582 \times 1.310 = 0.763 \text{ in} \)

V. Direct Analysis of a Column

Verify the maximum bending moment and deflection of a column using the direct analysis method.

Reference

Details

A 25' tall cantilevered column (i.e., a flagpole) is subject to an axial load of 30 kips. The section is a W8x18 ($I_z = 61.9 \text{ in}^4$).
Validation

A notional load factor of 0.003 is used. Therefore, the horizontal notional load at the top (free end) of the column is \( H = 0.03 \times 30 = 0.9 \text{ kips} \).

Maximum moment

The maximum moment occurs at the fixed base.

\[
M_{\text{MAX}} = M_0 \left( \frac{\tan \alpha}{a} \right)
\]

where

\[
M_0 = H L = 0.09 \times 25 = 2.25 \text{ ft} \cdot \text{k}
\]

\[
a = \sqrt{\frac{PL^2}{EI}} = \sqrt{\frac{30 \times (25)^2 \times (12)^2}{29,000 \times 61.9}} = 1.226
\]

\[
\frac{\tan \alpha}{a} = \frac{\tan(1.226)}{1.226} = 2.273
\]

Therefore, the maximum moment is: \( 2.25 \times 2.273 = 5.115 \text{ ft} \cdot \text{k} = 61.37 \text{ in} \cdot \text{k} \)

Maximum deflection

The maximum deflection occurs at the free end.

\[
\delta_{\text{MAX}} = \delta_0 \left( \frac{3(\tan \alpha, \cdot, a)}{a^3} \right)
\]

where

\[
\delta_0 = \frac{HL^3}{3EI} = \frac{(0.09)(25)^2(12)^3}{3(29,000)(61.9)} = 0.451 \text{ in}
\]

\[
\frac{3(\tan \alpha, \cdot, a)}{a^3} = \frac{3(\tan(1.226), 1.226)}{1.226^3} = 2.537
\]

Therefore, the maximum deflection is: \( 0.451 \times 2.537 = 1.145 \text{ in} \)

V. Single Column P-Delta Analysis

Determine the support forces at the base of the column.

Details

A 12 ft tall column with a fixed base and free end is subject to a 3 kip axial load and a 5 kip lateral load. The section is a W8x10 using steel with a modulus of elasticity of 29,000 ksi.

Validation

Moment at the base including P-Delta

\[ M = H \times L + P \times \Delta \]

where

- \( H \) = the lateral load
- \( L \) = the length of the column
- \( P \) = the axial compression load
- \( \Delta \) = the displacement due to the lateral load at the free end of the column

\[ \frac{H L^3}{3EI} = \frac{5 \times (144)^3}{3 \times 29,000 \times 30.80} = 5.57 \text{ in} \]

Therefore, the moment is:

\[ M = 5 \times (144) + 3 \times (5.57) = 736.72 \text{ in} \cdot \text{kip} \]

V.08 Dynamic Analysis

V. Beam Subject to response spectrum

Find the maximum moment due to the time history loading and compare theoretical answers to the STAAD solution.

Reference

Problem

The supports of a simply supported beam are subjected to an acceleration time history. The maximum bending moment in the beam is computed for the first mode of the structure. This problem demonstrates the capabilities of STAAD to calculate the correct modal response of a structure utilizing response spectrum data.

Figure 471: Simple span beam

L = 240 in.

The STAAD model consists of 11 nodes and 10 elastic beam elements. Node 1 is completely restrained with the exception of having rotational freedom in the Z direction, the remaining nodes are restrained except for X and Y displacements and Z rotations. Node 11 is additionally restrained against displacements in the Y direction to provide for the simple support condition. Only the contribution of the first mode of the structure is considered.

Figure 472: Finite element model

Theoretical Solution

Material Properties

\[ E = 30 \times 10^6 \text{ lb/in}^2 \]
\[ EI = 1.0 \times 10^{10} \text{ lb-in}^2 \]
\[ m = 0.2 \text{ lb-sec}^2 / \text{ in}^2 \]
h = 14.0 in.

From Reference 2, Table 8-1, page 108, the fundamental frequency of the beam is:

\[ f_i = \frac{\lambda_i^2}{2\pi^2} \sqrt{\frac{EI}{m}} = \frac{9.869 \times 10^9}{2\pi^2} \frac{1.0(10)^{10}}{0.2} = 6.098 \text{Hz} \]

The modal participation factor for the fundamental mode is:

\[ \Gamma = \frac{\int_0^1 m \phi(x) \, dx}{\int_0^1 m \phi^2(x) \, dx} \]

Where the first mode shape, \( \phi(x) = \sin(\pi x / l) \)

\[ \Gamma = \frac{m \int_0^1 \sin \frac{\pi x}{l} \, dx}{m \int_0^1 \sin^2 \frac{\pi x}{l} \, dx} = 4 \pi \]

The maximum relative modal displacement is given by:

\[ A_{\max} = \Gamma u_{\max}^{0} \]

where

\[ u_{\max}^{0} = \frac{y''}{\omega^2(DLF)_{\max}} \]
\[ \omega = 2\pi \times 6.098 \text{Hz} \]
\[ y''_{so} = 1.0g \]
\[ (DLF)_{\max} = 1.648 \text{ at } 6.098 \text{ Hz} \]

therefore:

\[ A_{\max} = 4(1.648)(386.4)/(\pi(2\pi)^2(6.098)^2) = 0.5523 \text{ in.} \]

The bending moment

\[ M = -EI \delta^2(\delta x^2) \]

Where \( u \) for the first mode = \( A \sin(\pi x / l) \)

\[ \delta^2(\delta x^2) \]

\[ M = AEI (\pi^2 l^2) \sin(\pi x / l) \]

\[ M_{\max} = A_{\max} EI (\pi^2 l^2) \]

at \( x = l/2 \)

\[ M_{\max} = 1(10)^{10} (0.5523) \pi^2 / (240^2) = 946.351(10)^3 \text{ lb in} \]

at \( x = l/2 \)

**V. First Modal Frequency of a Cantilever Beam**

To calculate the Natural frequency of vibration for a rectangular cantilever beam with a mass at the free end.

**Reference**

Hand calculation using known formulas.

**Problem**

Find the natural frequency of vibration, $\omega$, of the cantilever beam.
Hand Calculations

Stiffness at free end:

\[ k = \frac{3EI}{L^3} = 45 \text{ k/in} \]

Mass

\[ m = \frac{w}{g} = \frac{10.0 \text{ k}}{386.4 \text{ k-sec}^2/\text{in}} = 0.02588 \text{ k-sec}^2/\text{in} \]

Circular frequency:

\[ \omega = \sqrt{\frac{k}{m}} = \sqrt{\frac{45}{0.02588}} = 41.7 \text{ rad/sec} \]
\[ = 6.637 \text{ cycles/sec} \]

V. Modal Response of a 3D Frame

Find the natural frequencies of a space frame. Compare the results from subspace iteration method used by STAAD.Pro with the results from EASE2® and ANSYS®.

Reference

1. Problem 1, from the ASME 1972 Program Verification and Qualification Library

**Problem**

A three dimensional frame is analyzed for its natural frequencies and the associated mode shapes using the subspace iteration method offered by STAAD.Pro.

![Frame model](image)

**Figure 476: Frame model**

L1 = 8.625 ft  
L2 = 10 ft

All dimensions are in inches.

The only entity present in the model is the general purpose three dimensional beam.

**Cross-section Properties**

All the beam elements have the same cross section:
Outside radius, $R_o = 1.1875$ in.
Inside radius, $R_i = 1.0335$ in.

Area, $A = \pi(R_o^2 - R_i^2) = 1.074532$ in$^2$

Moment of Inertia, $I = \frac{\pi}{4}(R_o^4 - R_i^4)$
$\quad I = 0.665747$ in$^4$

Torsion constant = twice the inertia, for closed circular sections = 1.331494 in$^4$

The expression for the shear flexibility factor is derived from the ratio of maximum shear stress to the average shear stress:

$$\alpha = \frac{AQ}{Ib}$$

Where the four items – A, Q, I, and b are properties of the half cross-section about the centerline. For the circular section they are:

$$A = \frac{\pi}{2}(R_o^2 - R_i^2)$$
$$Q = \frac{2}{3}(R_o^3 - R_i^3)$$
$$I = \frac{\pi}{8}(R_o^4 - R_i^4)$$
$$I = 2(R_o - R_i)$$

The final expression for the shear flexibility factor, for a circular tube section is:

$$\alpha = \frac{AQ}{Ib} = 4 \frac{R_o^3 - R_i^3}{\left(R_o^2 - R_i^2\right)\left(R_o - R_i\right)}$$

$$\alpha = 1.993620$$

Hence the shear area is entered as

$$AY = \text{Cross Section Area} / \alpha = 1.074532 / 1.99362 = 0.538985$$ in$^2$

**Comparison**

The following table compares Twenty-Four Natural Frequencies

<table>

</table>
In both references by DeSalvo and Swanson\textsuperscript{2} and Peterson\textsuperscript{3}, the number of dynamic degrees of freedom has been reduced from 42 to 24, by means of the Guyan method. No such reduction is performed in the STAAD.Pro model.

V. Modal Response of a Beam

Find the natural frequencies for a beam and compare theoretical answers to the STAAD.Pro solution.

Reference

Problem

The first five natural frequencies and the associated mode shapes are computed for the flexural motion of a simply supported beam.

\[ L = 20 \text{ in} \]

\[ \begin{align*}
\text{Area} &= 2 \text{ in}^2 \\
J &= \frac{b^3 a}{16} \left( \frac{16}{3} + 3.36 \left( \frac{b}{a} \right)^4 \right) \\
\text{where} & \\
a &= 2 \\
b &= 1 \\
J &= 0.4578 \text{ inch}^4
\end{align*} \]

Figure 477: Simple beam diagram

Figure 478: Finite element model

The simply supported beam is divided into twenty spanwise beam elements. At nodes 1 and 21, all degrees of freedom except the rotation about the Z axis are restrained. For the remaining nodes, only the translation along Y and the rotation about Z are permitted. Both shear deformation and rotary inertia have been excluded from the model. The mass matrix is a diagonal matrix.

Cross-section Properties

Rectangular Section: 1 inch Width x 2 inch Depth

\[ \begin{align*}
\text{Area} &= 2 \text{ in}^2 \\
J &= \frac{b^3 a}{16} \left( \frac{16}{3} + 3.36 \left( \frac{b}{a} \right)^4 \right) \\
\text{where} & \\
a &= 2 \\
b &= 1 \\
J &= 0.4578 \text{ inch}^4
\end{align*} \]
\[ I_2 = 1 \times 2^3 / 12 \text{ inch}^4 \]
\[ I_3 = 2 \times 1^3 / 12 \text{ inch}^4 \]

**Theoretical Results**

The natural bending frequencies, for a uniform beam with hinged ends, are given by:

\[ f_n = \frac{n \pi^2}{2l^2} \sqrt{\frac{EI}{AgA}} \]

where

- \( f_n \) = natural frequency for mode n, in cycles per second
- \( l \) = span of the beam
- \( E \) = elastic modulus
- \( I \) = cross-section moment of inertia
- \( g \) = gravitational constant
- \( A \) = cross-section area
- \( \gamma \) = weight density

The parameters used in the frequency equation are:

- \( l = 20 \text{ in} \)
- \( E = 10 \times 10^6 \text{ psi} \)
- \( I = 0.6667 \text{ in}^4 \)
- \( g = 386.4 \text{ in/s}^2 \)
- \( A = 2.0 \text{ in}^2 \)
- \( \gamma = 0.1 \text{ lbs/in}^3 \)

from which:

\[ f_n = n^2 \times 445.686 \]

**Comparison**

The table below shows the natural frequencies computed from the theoretical equation and the subspace iteration method available within STAAD.Pro. Frequencies are in cycles per second.

V. Modal Response of a Circular Plate

Find the natural frequencies of a circular plate and compare theoretical answers to the STAAD solution.

Reference

Problem

A flat circular plate is simply supported around the entire perimeter. The first six modes and their associated natural frequencies are to be computed using the subspace iteration method offered by STAAD. This problem demonstrates that the natural frequencies of an axi-symmetric structure can be accurately computed utilizing a 180 degree model with the appropriate boundary conditions.

The 180 degree sector was modeled using radial lines at intervals of 15 degrees. Tangential lines were then located utilizing a relationship such that the aspect ratio of the quad-plate elements was approximately 1.0. All rotations normal to the plane of the plate were restrained. In-plane translations for all nodes were restrained.
because the theoretical solution does not consider in-plane effects. Rotations about the global Y axis for the
nodes at X=0.0 were restrained because this is a symmetry boundary. Z translation of all nodes on the outside
radius were restrained to provide for the simply-supported condition.

It should be noted that the outside edge of the plate is a series of secant lines instead of a true arc. This will
result in a loss of about 1% of the plate's true mass or about .5% of the mass that is effective for this problem.
Therefore, it is not unlikely that a few natural frequencies will be lower than the theoretical values instead of
higher which is typical for a finite element analysis using plate elements. In addition, a true simple-support
condition for this problem would require restraining the component of rotation that is radial to the outside edge.

Theoretical Calculations
From the reference case 2 in Table 11-1, the first six natural frequencies of the plate are described by the
following equation:

\[ f_{ij} = \frac{\lambda_{ij}^2}{2na^2} \sqrt{\frac{Eh^3}{12y(1-\nu^2)}} \]

= dimensionless parameter associated with the mode indices i,j

where

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>i</td>

<td>plate thickness</td>
</tr>
<tr>
<td>\gamma</td>
<td>mass of plate per unit area</td>
</tr>
<tr>
<td>\alpha</td>
<td>radius of plate</td>
</tr>
</tbody>
</table>

The numerical values used for this example are:

\[ \nu = 0.30 \]

\[ \E = 10.0 \times 10^6 \text{ psi} \]
h = 0.10 inches

\[
\gamma = \frac{(0.10 \text{ lb/in}^3)(0.10 \text{ in})}{(386.4 \text{ lb/m \cdot in/lb \cdot s}^2)} = 2.588 \times 10^{-5} \text{ in/lb \cdot s}^2\text{ /in}^3
\]

a = 10.0 inches

with the numerical values used above

\[
\frac{1}{2n^2 a} \sqrt{\frac{E h}{12 \gamma (1 - \nu^2)}} = \frac{1}{2n^2 (10.0)^2} \sqrt{\frac{(10.0 \cdot 10^6)(0.10)^2}{12(2.588 \cdot 10^{-5})(1 - 0.3^2)}} = 9.467 \text{ cycles/sec.}
\]

\(\lambda^2_{ij}\) is tabulated from the reference as follows:

</table>
The reference did not tabulate a value of for the fifth mode of the structure, hence a comparison with the theoretical value of this mode cannot be made.

All anti-symmetric mode shapes for the 360 degree circular plate were captured by the 180 degree model with a phase angle included in the calculation. Some of the difference between the theoretical and STAAD.Pro frequencies is attributed to the loss of mass due to the piecewise secant representation of the outer radius and, since this mass is about 1 percent lower than for a true circular plate, it is not surprising that the first few modes are lower than the theoretical solution.

Figure 481: Simply supported, rectangular plate

L = 45 in., W = 30 in., t = 0.2 in.

A plate with an aspect ratio of 1.5 was used so that comparison could be made with theoretical results tabulated for plates in the reference. An equally spaced mesh was utilized in both the x and the y dimensions of the plate. The number of elements in each dimension was determined on the basis of the highest mode of interest. Since
the number of half-waves in the sixth mode is 3 in the length dimension and 2 in the width dimension, a node spacing of 3.75 inches results in each half-wave being represented by four elements which means that no element will be expected to deform in double curvature. The simply supported edge condition requires that translation normal to the plane of the plate be restrained for these edge nodes. Rotations normal to the plate were restrained for all nodes.

Theoretical Calculations

From the reference case 16 in Table 11-4, the first six natural frequencies of the plate are described by the following equations:

\[
f_{ij} = \frac{\lambda_{ij}^2}{2na^2} \sqrt{\frac{Eh^3}{12\gamma(1-\nu^2)}}
\]

where

\[
i = \text{number of half-waves in this mode shape along the horizontal axis}
\]

\[
j = \text{number of half-waves in this mode shape along the vertical axis}
\]

\[
\nu = \text{Poisson's ratio}
\]

\[
E = \text{elastic modulus}
\]

\[
h = \text{plate thickness}
\]

\[
\gamma = \text{mass of material per unit area}
\]

\[
a = \text{length of plate}
\]

\[
b = \text{width of plate}
\]

The numerical values used for this example are:

\[
\nu = 0.30
\]

\[
E = 30.0 \times 10^6 \text{ psi}
\]

\[
h = 0.2 \text{ inches}
\]

\[
\gamma = \frac{(0.282 \text{ lb}/\text{in}^3)(0.20 \text{ in})}{(386.4 \text{ lb}/\text{in}/\text{lb}_f \cdot \text{s}^2)} = 0.146 \times 10^{-4} \text{ in}/\text{lb}_f \cdot \text{s}^2/\text{in}^3
\]

\[
a = 45.0 \text{ in}
\]

\[
b = 30.0 \text{ in}
\]
with the numerical values used above

\[ \frac{1}{2 \pi a^2} \sqrt{\frac{E h^3}{12 \gamma (1 - \nu^2)}} = \frac{1}{2 \pi (10.0)^2} \sqrt{\frac{(30.0 \cdot 10^6)(0.20)^3}{12[1.460 \cdot 10^{-4}][1 - (0.3)^2]}} = 0.9644 \text{ cycles/sec.} \]

\( \lambda^2_{ij} \) is tabulated from the reference as follows:

**Table 570: Values of \( \lambda^2_{ij} \)**

<table>
<thead>
<tr>

V. Natural Frequency of a 2D Truss

To calculate the Natural frequency of vibration for a two story truss.

Reference
Hand calculation using known formula.

Problem
Find the natural frequency of vibration, $f$, of the truss.

Figure 483: Space truss

$E = 30,000$ ksi
$L = 10$ ft
$P = 10$ kips

All members are L4x4x5/16
**Hand Calculation**

Calculate average deflection at top:

\[ \delta_{\text{avg}} = \frac{(0.45255 \text{ in} + 0.43535 \text{ in})}{2} = 0.444 \text{ in} \]

Stiffness of truss:

\[ k = \frac{P}{\delta_{\text{avg}}} = 20.0 \text{ kip} / 0.444 \text{ in} = 45.5 \text{ k/in} \]

Mass:

\[ M = \frac{w}{g} = \frac{20.0}{386.4} = 0.05175 \text{ k-sec}^2/\text{in} \]

Frequency:

\[ f = \frac{\sqrt{k/m}}{2\pi} = \frac{\sqrt{45.057/0.05175}}{2\pi} = 4.696 \text{ Hz} \]

V. Natural Frequency of Beam on Springs

Find the period of free vibration for a beam supported on two springs with a point mass.

Reference

Problem

A simple beam is supported by two spring as shown in the figure. Neglecting the distributed mass of the beam, calculate the period of free vibration of the beam subjected to a load of $W$.

\[
\begin{align*}
EI &= 30,000.0 \text{ ksi} \\
A &= 7.0 \text{ ft} \\
B &= 3.0 \text{ ft.} \\
W &= 1,000 \text{ lbf} \\
K &= 300.0 \text{ lb/in.}
\end{align*}

V. Steady State Loading on a Beam

Calculate the deflections at two points along the beam at steady-state condition.

Reference

Problem

Determine the steady-state displacements of the quarter and mid-span points of a fixed-fixed beam subjected to a parabolically varying distributed load operating at a 7.5 Hz frequency.

![Figure 487: Beam with harmonic distributed load](image)

**Figure 487: Beam with harmonic distributed load**
Theoretical Solution

The theoretical solution for this example is taken from:

The natural frequencies of the system are calculated using the equations from reference 1 page 108 and reference 2 page 85.

\[
f_i = \frac{\lambda_i^2}{2\pi l^2} \sqrt{\frac{EI}{m}}
\]

where

\[
m = \rho A / g
\]

\[
f_i = \frac{\lambda_i^2}{2\pi (200)^2} \sqrt{\left[ \frac{1.0(10)^{10}}{2(386.4)} \right] \left[ \frac{1.0(10)^{10}}{2(386.4)} \right]}
\]
\[ \lambda_i \text{satisfies the characteristic equation:} \]
\[ \cos \lambda_i \cosh \lambda_i - 1 = 0 \]

**Table 576: Calculated natural frequency for each mode**

<tr>
<td>8</td>
<td>26.70354</td>
<td>2023.185</td>
<td>321.9998</td>
</tr>
</tbody>
</table>

The mode shapes are:

\[ \phi_i = \cosh \frac{\lambda_i x}{l} - \cos \frac{\lambda_i x}{l} - \sigma_i \left( \sinh \frac{\lambda_i x}{l} - \sin \frac{\lambda_i x}{l} \right) \]

Where:

\[ \sigma_i = \frac{\cosh \lambda_i - \cos \lambda_i}{\sinh \lambda_i - \sin \lambda_i} \]

The response of mode \( i \) to a harmonic force:

\[ \eta_i = \frac{\int \phi_i(x) P(x) \, d x}{\omega_i^2 |\phi_i(x)|^2 m \, d x} \left( \frac{\sin(\omega t - \psi_i)}{1 - \frac{\omega^2}{\omega_i^2}} \right) \left( \frac{c}{\pi} \right)^2 \]

Where \( \psi_i \) is the response phase lag relative to the applied force and \( c \) is the damping.

Since \( c = 0.0 \), \( \psi_i = 0.0 \)

Upon substitution and rearranging terms:

\[ \eta_i = \frac{4P_0}{l^2} \left( x - x^2 \right) \left( \int |\phi_i(x)|^2 \, d x \right) \sin \omega t \]

From reference 1, page 466, case c and page 467, case 29:
\[
\frac{4P_0}{l^2} \int \phi_i(x) \, d \, x - \frac{4P_0}{l^2} \int x^2 \phi_i(x) \, d \, x = \frac{8P_0}{\beta_i^2 l} \left[ 1 + (-i)^i - (-i)^i \sigma_i \beta_i \right] - \frac{8(-i)^i P_0}{\beta_i^2 l} \left[ 2 - \sigma_i \beta_i \right]
\]

Since the load is symmetric, this expression is zero for \( i = 2, 4, 6 \ldots \);

Therefore, \( i = 1,3,5 \ldots \), and: \((-1)^i = -1\)

And from the reference, \( \beta_i = \lambda_i / l \)

So:
\[
\int \phi_i(x) P(x) \, d \, x = \frac{16P_0 l}{\lambda_i^2}
\]

From Reference 1, page 457 case 5:
\[
\int \phi_i(x)^2 \, d \, x = 1
\]

Therefore:
\[
\omega = 7.5(2\pi) = 47.1239 \text{ radians/sec}
\]

\[
\eta_i = \frac{16P_0}{m \lambda_i^2 (\omega_i^2 - \omega^2)} \sin \omega t = \frac{16(-1.0)\sin \omega t}{0.1062(10^2)(\omega_i^2 - 2)} = \frac{30,912 \cdot \sin \omega t}{\lambda_i^2 (\omega_i^2 - 2, 220.661)}
\]

*************** END OF LATEST ANALYSIS RESULT ***************
```
V. Steady State - With Damping

Determine amplitude of motion of a beam due to harmonic force.

Reference

Problem

A 10' long, simply-supported beam simulating a damped oscillator.

- Material modulus of elasticity, \( E = 30,000 \text{ ksi} \)
- Section moment of inertia, \( I_z = 120 \text{ in}^4 \)
- Weight applied at mid-span, \( F_y = 3.86 \text{ kips} \)

A steady state analysis is performed for the harmonic forcing function \( 7000 \sin 60t \) with the forcing frequency \( \omega = 60 \text{ rad/sec} = 9.5493 \text{ cyc/sec} \) & the magnitude = 7000 lb = 7 kip applied at the midpoint of the beam. Damping is considered for this problem and the value of 0.1 is specified.

V. Time History - Blast Loading

Determine the dynamic response of a tower subjected to blast loading.

Reference

Problem

Material modulus of elasticity (assumed steel), $E = 29,000 \text{ ksi}$ and Poisson's ratio, $\nu = 0.3$

Length (assumed) = 10 ft

Section moment of inertia, $I_z = 1,986.4 \text{ in}^4$  (given $K = 100 \text{ kip/in}$, rearrange $K = 3EI/L^3$ to solve for $I = KEL^3/3$)
Horizontal weight applied at top of 10' tower, $F_x = 38.6$ kips

V. Time History - Ground Acceleration

Determine the response of a two-story portal frame subjected to suddenly applied constant acceleration of 0.28 g at its base.
Reference

Problem

- Material modulus of elasticity, $E = 30,000$ ksi and Poisson’s ratio, $\nu = 0.3$
- Section moment of inertia, $I_{z1} = 248.6$ in$^4$, $I_{z2} = 106.3$ in$^4$
- Mass at first story above ground, $F_x = 52.5$ kips, at roof story $F_x = 25.5$ kips
- Constant ground acceleration = $0.28g = 9.03917$ ft/sec$^2$

The ground acceleration is applied as a time vs. acceleration function with the data pairs supplied up to $t = 2$ sec.

V. Time History - Rectangular Pulse Force

Determine the maximum displacement at the top and maximum bending stress in the columns of a one-story portal frame subject to a rectangular pulse force.

Reference

Problem
From the reference:

A one-story building, idealized as a 12-ft high frame with two columns hinged at the base and a rigid beam, has a natural period of 0.5 sec. Each column is an America standard wide-flange steel section W8x18. Its properties for bending about its major axis are \( I_x = 61.9 \text{ in}^4 \), \( S = I_x/c = 15.2 \text{ in}^3 \); \( E = 30,000 \text{ ksi} \). Neglecting damping, determine the maximum response of this frame due to a rectangular pulse force of amplitude 4 kips and duration \( t_d = 0.2 \text{ sec} \). The response quantities of interest are displacement at the top of the frame and maximum bending stress in the columns.

The following time vs. force function is applied for the rectangular pulse force:

![Figure 491: Rectangular pulse force](image)

Calculations
The natural frequency of the structure is:

\[
\omega_n = \frac{2\pi}{T_n} = \frac{2\pi}{0.5} = 12.57 \text{ rad/sec}.
\]

Also, the lateral stiffness of the frame:

\[
k = 2 \frac{3EI}{L^3} = 2 \frac{3 \times 30,000 \times 61.9}{12 \times 12^3} = 3.73 \text{ kips/in}
\]
Solving $\omega_n = \sqrt{\frac{k}{m}}$ for $m$, $m = \frac{k}{\omega_n^2} = \frac{3.73 \times 10^3}{12.57^2} = 23.62 \text{ lbs}$.

Thus, the force applied at the top of the frame as the mass load is $W = m \times g = 23.62 \text{ lbs} \times 32.2 \text{ ft/s}^2 \times 12 \text{ in/ft} = 9,122 \text{ lbs-force} = 9.122 \text{ kips}$.

**Modeling notes:**

- A new material with the modulus of elasticity specified is used in place of the built-in steel material.
- For the generation of the STAAD.Pro model, the cross-section of the beam is take as $6'' \times 6''$ and the cross-section properties are assigned using a user-provided table for prismatic shapes. A massive $(10^6 \text{ ft}^4)$ moment of inertia about local z and y axes is specified to approximate an infinitely rigid beam.
- Pinned supports are supplied at the base of each column. A fixed-but allowing only translation along the global X axis is assigned to the tops of the columns / beam ends.
- As STAAD.Pro defaults to a damping ratio of 0.05 if no arrival time is specified (i.e., an arrival time of $t = 0$ seconds), a negligible damping of $1.1 \times (10)^{-6}$ is assigned.

V. AS4100 1998 - Bending Capacity for Non-compact Section

Verify the bending capacity for a non-compact section per AS4100-1998.

Given

The member is 8 m long simply-supported beam. The section is a 900WB218. The member is subject to major axis bending due to uniform dead load of 4.17 kN/m and live load of 8 kN/m as well as concentrated dead load of 104 kN and live load of 140 kN at mid-span.

Section Properties

- Overall depth of section, $D = 910$ mm
- Width of section, $B = 350$ mm
- Thickness of web, $t_w = 12$ mm
- Thickness of flange, $t_f = 25$ mm
- Area, $A_g = 27,800$ mm$^2$
- Moment of inertia about major axis, $I_{zz} = 4,060 \times 10^6$ mm$^4$
- Moment of inertia about minor axis, $I_{yy} = 179 \times 10^6$ mm$^4$
- Elastic section modulus about major axis, $Z_{xx} = 8.92 \times 10^6$ mm$^3$
- Elastic section modulus about minor axis, $Z_{yy} = 1.02 \times 10^6$ mm$^3$
- Plastic section modulus about major axis, $S_{xx} = 9.96 \times 10^6$ mm$^3$
- Plastic section modulus about minor axis, $S_{yy} = 1.56 \times 10^6$ mm$^3$
- Torsion constant, $J = 4.02 \times 10^6$ mm$^4$
- Warping moment, $I_w = 35.05 \times 10^{12}$ mm$^4$
- Radius of gyration, $r_x = \sqrt{\frac{I_{zz}}{A}} = 382.2$ mm
- Radius of gyration, $r_y = \sqrt{\frac{I_{yy}}{A}} = 80.2$ mm

Material Properties

- $E = 200,000$ MPa
- $G = 80,000$ MPa
- $f_y = 360$ MPa (flange); $f_y = 400$ MPa (web)

Validation

Section Slenderness Check

$$\frac{b}{2} = \frac{(350 - 12)}{2} = 169$$ mm

Flange section slenderness parameter, $\lambda_{ef} = \frac{b \sqrt{I_y / 250}}{t_f / 250} = \frac{169 \sqrt{360 / 250}}{250} = 8.112 > \lambda_{ep} = 8$, therefore the flange is non-compact.

$$d = D - 2xt_f = 910 - 25 \times 2 = 860$$ mm

Web section slenderness parameter, $\lambda_{ew} = \frac{d \sqrt{I_y / 250}}{t_w / 250} = \frac{860 \sqrt{400 / 250}}{250} = 90.65 > \lambda_{ep} = 82$, therefore the web is non-compact.
Section Bending Capacity Major Axis
The plastic section capacity, $Z_{cr}$, is the minimum of $S_{xx}$ or $1.5 \times Z_{xx} = 1.5(8.92 \times 10^6) = 13.38 \times 10^6 \text{ mm}^3$; so $Z_{xx} = 9.96 \times 10^6 \text{ mm}^3$.

From Table 5.2 of AS 4100, $\lambda_{ey} = 115$ and $\lambda_{ep} = 82$.

For sections where $\lambda_{ep} < \lambda < \lambda_{ey}$, the effective section modulus is calculated as:

$$Z_{ex} = Z_{xx} + \frac{\lambda_{ey} \cdot \lambda_{ew}}{\lambda_{ey} \cdot \lambda_{ep}} (Z_{ex} - Z_{xx}) = \left[ 8.92 + \frac{115 \cdot 90.65}{115 \cdot 82} (9.96 \cdot 8.92) \right] \times 10^6 = 9.69 \times 10^6 \text{ mm}^3$$

$$M_{sx} = Z_{ex} \times f_y = 9.69 \times 360 = 3,488 \text{ kN m}$$

$$\phi M_{sx} = 0.9 \times 3,488 = 3,139 \text{ kN m}$$

Section Bending Capacity Minor Axis
The plastic section capacity, $Z_{cy}$, is the minimum of $S_{yy}$ or $1.5 \times Z_{yy} = 1.5(1.02 \times 10^6) = 1.53 \times 10^6 \text{ mm}^3$; so $Z_{yy} = 1.53 \times 10^6 \text{ mm}^3$.

For sections where $\lambda_{ep} < \lambda < \lambda_{ey}$, the effective section modulus is calculated as:

$$Z_{ey} = Z_{yy} + \frac{\lambda_{ey} \cdot \lambda_{ew}}{\lambda_{ey} \cdot \lambda_{ep}} (Z_{ey} - Z_{yy}) = \left[ 1.02 + \frac{115 \cdot 90.65}{115 \cdot 82} (1.53 \cdot 1.02) \right] \times 10^6 = 1.53 \times 10^6 \text{ mm}^3$$

$$M_{sy} = Z_{ey} \times f_y = 1.53 \times 360 = 552.4 \text{ kN m}$$

$$\phi M_{sy} = 0.9 \times 552.4 = 497.1 \text{ kN m}$$

Member Bending Capacity
Twist restraint factor,

$$k_t = 1 + \left( \frac{2 \times d}{l} \right) \left( \frac{0.5 \times t f}{t_w} \right)^3 = 1 + \left( \frac{2 \times 860}{8000} \right) \left( \frac{0.5 \times 25}{12} \right)^3 = 1.24$$

From Table 5.6.3(2) of AS 4100, Load Height Factors, $k_l = 1.4$.

From Table 5.6.3(3) of AS 4100, Lateral Rotation Restraint Factors, $k_r = 1.0$.

Effective length of the member:

$$l_e = k_t k_l k_r l = 1.24 \times 1.4 \times 1.0 \times 8,000 = 13,900 \text{ mm}$$

$$M_o = \sqrt{A(B+C)}$$

(Eqn 5.6.1.1(3))

where

$$A = \frac{n^2 EI_y}{l_e^2} = \frac{n^2 \times 200 \times 10^3 \times 179 \times 10^6}{(13,900)^2} = 1.829 \times 10^6 \text{ N}$$

$$B = \frac{n^2 EI_w}{l_e^3} = \frac{n^2 \times 200 \times 10^3 \times 35 \times 10^{12}}{(13,900)^3} = 357.6 \times 10^9 \text{ N mm}^2$$

$$C = G \times J = 80 \times (10)^3 \times 4.02 \times (10)^6 = 321.6 \times (10)^9 \text{ N mm}^2$$

$$M_o = \sqrt{1.829 \times (10)^6 \left[ 357.6 \times 10^9 + 321.6 \times (10)^3 \right]} = 1.116 \times (10)^6 \text{ N mm = 1.116 kN m}$$

The slenderness reduction factor is then:

$$a_s = 0.6 \left( \frac{M_{s}^2}{M_o^2} + 3 \cdot \frac{M_{s}^2}{M_o^2} \right) = 0.6 \left( \frac{(3,488)^2}{(1,116)^2} + 3 \cdot \frac{3,488}{1,116} \right) = 0.268$$

(Eqn. 5.6.1.1(2))
The moment shape factor is then:

\[ M_1 = M_3 = 436.8 \text{ kN m} \]
\[ M_2 = M_{\text{max}} = 805.6 \text{ kN m} \]

\[ a_m = \frac{1.7M_{\text{max}}}{\sqrt{M_2^2 + M_3^2 + M_4^2}} = \frac{1.7 \times 805.6}{\sqrt{(436.8)^2 + (805.6)^2 + (436.8)^2}} = 1.35 \]

The member moment capacity:

\[ \phi M_b = \phi a_m a_s M_s = 0.9 \times 1.35 \times 0.268 \times 3,488 = 1,135 \text{ kN m} \]  
(Eqn 5.6.1.1(1))

V. AS4100 1998 - Cantilever subject to tension and bending

Verify the tension and out-of-plane bending capacities of an I section cantilever beam per the AS 4100 1998 code.

Details
The cantilevered member is 2 m in length. The section is a 250UC89.5 of grade 300 steel. The member is subject to 434 kN in tension.

Section Properties
- Cross-sectional area, \( A_g = 11,400 \, mm^2 \)
- Plastic section modulus, \( S_{xx} = 1.23 \times 10^6 \, mm^3 \)

Material Properties
- \( E = 199,947 \, MPa \)
- \( G = 80,000 \, MPa \)
- \( F_{y,\text{web}} = 300 \, MPa \)
- \( F_{y,\text{flange}} = 280 \, MPa \)
- \( F_u = 440 \, MPa \)

Validation

Axial Tension Capacity
Gross yielding:

\[
N_{ty} = A_g f_y = 11,400 \times 280(10)^{-3} = 3,190 \, kN
\]

Fracture:
Assume net area, \( A_n \), is equal to the gross area.

\[
K_t = \text{correction factor for distribution of forces} = 1.0
\]

\[
N_{tf} = 0.85 K_t A_n f_u = 0.85 \times 1.0 \times 11,400 \times 440(10)^{-3} = 4,264 \, kN
\]

\( N_t \) is the lesser of \( N_{ty} \) and \( N_{tf} \), \( N_t = 3,190 \, kN \)

\[
\phi N_t = 0.9 \times 3,190 = 2,870 \, kN
\]

Section Bending Capacity

\[
M_{sx} = S_{xx} f_y = 1.23(10)^6 280 = 344 \, kN \cdot m
\]

\[
\phi M_{sx} = 0.9 \times 344 = 310 \, kN \cdot m
\]

Axial tensile load, \( N \), mitigating flexural-torsional buckling:

\[
M_{ox} = M_{bx} \left(1 + \frac{N}{\phi N_t}\right) = 336 \left(1 + \frac{434}{2,870}\right) = 387 \, kN \cdot m
\]

\[
\phi M_{ox} = 0.9 \times 387 = 348 \, kN \cdot m
\]

******************************************************************************

MEMBER DESIGN OUTPUT FOR PMEMBER 1

**DESIGN Notes**

1. (*) next to a Load Case number signifies that a P-Delta analysis has not been performed for that particular Load Case; i.e. analysis does not include second-order effects.
2. $\phi = 0.9$ for all the calculations [AS4100 Table 3.4]
3. (#) next to Young's modulus $E$ indicates that its value is not 200000 MPa as per AS4100 1.4.

V. AS4100 1998 - Combined Section and Member In-Plane Capacity

Verify the bending capacity in major and minor axis bending, biaxial bending, and in-plane bending for a UC member subject an axial load per AS4100-1998.

Given
The member is 7 m long and part of a steel frame structure. The section is a 200UC52.2. The member is subject to an axial load of 143.9 kN.

Section Properties
- Depth of section, \( D = 206 \text{ mm} \)
- Width of section, \( B = 204 \text{ mm} \)
- Thickness of web, \( t_w = 8 \text{ mm} \)
- Thickness of flange, \( t_f = 12.5 \text{ mm} \)
- Area, \( A_g = 6,660 \text{ mm}^2 \)
- Moment of inertia about major axis, \( I_{zz} = 52.8 \times 10^6 \text{ mm}^4 \)
- Moment of inertia about minor axis, \( I_{yy} = 17.7 \times 10^6 \text{ mm}^4 \)
- Elastic section modulus about major axis, \( Z_{xx} = 513 \times 10^3 \text{ mm}^3 \)
- Elastic section modulus about minor axis, \( Z_{yy} = 174 \times 10^3 \text{ mm}^3 \)
- Plastic section modulus about major axis, \( S_{xx} = 570 \times 10^3 \text{ mm}^3 \)
- Plastic section modulus about minor axis, \( S_{yy} = 264 \times 10^3 \text{ mm}^3 \)
- Radius of gyration, \( r_x = \sqrt{\frac{I_{zz}}{A}} = 89.0 \text{ mm} \)
- Radius of gyration, \( r_y = \sqrt{\frac{I_{yy}}{A}} = 51.6 \text{ mm} \)

Material Properties
- \( f_y = 300 \text{ MPa} \) (flange); \( f_y = 320 \text{ MPa} \) (web)
Validation

Combined Major Axis Section Moment Capacity

Nominal axial capacity: \( \phi N_s = 0.9 \times 6.66 \times 300 = 1,798 \text{ kN} \)

Nominal section capacity: \( \phi M_{sx} = 0.9 \times 570 \times 300 = 153.9 \text{ kN} \cdot \text{m} \)

The section is compact, so the alternate method is applicable.

\[
\phi M_{rx} = \phi 1.18 M_{sx} \left( 1 - \frac{N}{\phi N_s} \right) \leq \phi M_{sx}
\]

\[
\phi M_{rx} = 1.18 \times 153.9 \left( 1 - \frac{143.9}{1,798} \right) = 167.1 \text{ kN} \cdot \text{m} > \phi M_{sx}
\]

\[
\phi M_{rx} = \phi M_{sx} = 153.9 \text{ kN} \cdot \text{m}
\]

Combined Minor Axis Section Moment Capacity

Nominal section capacity: \( \phi M_{sy} = \phi S_{yy} F_y \leq 1.5 Z_{yy} F_y \)

\[
\phi M_{sy} = 0.9 \times 264 \times 300 = 71.3 \text{ kN} \cdot \text{m} > 0.9 \times 1.5 \times 174 \times 300 = 70.5 \text{ kN} \cdot \text{m}
\]

The section is compact, so the alternate method is applicable.

\[
\phi M_{ry} = \phi 1.19 M_{sy} \left( 1 - \frac{N}{\phi N_s} \right)^2 \leq \phi M_{sy}
\]

\[
\phi M_{ry} = 1.19 \times 70.5 \left( 1 - \frac{143.9}{1,798} \right)^2 = 71.0 \text{ kN} \cdot \text{m} > \phi M_{sy}
\]

\[
\phi M_{ry} = \phi M_{sy} = 70.5 \text{ kN} \cdot \text{m}
\]

Member In-plane Capacity Check

The section is compact, so the alternate method is applicable. The larger end moment = 111.1 \text{ kN} \cdot \text{m} and the smaller end moment = 108.1 \text{ kN} \cdot \text{m}.

\[
\beta_{mx} = \frac{108.1}{111.1} = 0.973
\]

\[
\phi M_{ix} = \phi M_s \left[ 1 - \left( 1 + \frac{\beta_m}{2} \right)^3 \left( 1 - \frac{N}{\phi N_c} \right) \right] + 1.18 \left( 1 + \frac{1 + \beta_m}{2} \right)^3 \sqrt{\left( 1 - \frac{N}{\phi N_c} \right)} \leq \phi M_{rx}
\]

\[
\phi M_{ix} = 153.9 \left[ 1 - \left( 1 + \frac{0.973}{2} \right)^3 \left( 1 - \frac{143.9}{1,798} \right) \right] + 1.18 \left( 1 + \frac{1 + 0.973}{2} \right)^3 \sqrt{\left( 1 - \frac{143.9}{1,798} \right)} \right) = 168.4 \text{ kN} \cdot \text{m} > \phi M_{rx}
\]

\[
\phi M_{ix} = \phi M_{rx} = 153.9 \text{ kN} \cdot \text{m}
\]

### PERFORM ANALYSIS

---

### STAAD Output

#### DESIGN Notes
1. (*) next to a Load Case number signifies that a P-Delta analysis has not been performed for that particular Load Case; i.e. analysis does not include second-order effects.
2. $\varphi = 0.9$ for all the calculations [AS4100 Table 3.4]
3. (#) next to Young's modulus $E$ indicates that its value is not 200000 MPa as per AS4100 1.4.

**Member Combined Capacity**

**Verification Examples**

- STAAD Pro 3795 User Manual
V. AS4100 1998 - Compression Capacity

Verify the capacity of a tubular compression member subjected to axial load only per AS4100-1998.

Given

The member 3.8 m long with pinned ends (no end moments). The section is a 219.1x6.4CHS. The member is subject to an axial load of 1,030 kN.

Section Properties

- Depth of section, \( d = 219.1 \text{ mm} \)
- Thickness, \( t = 6.4 \text{ mm} \)
- Area, \( A_g = 4,280 \text{ mm}^2 \)
- Moment of inertia about major axis, \( I_{zz} = 22.2 \times 10^6 \text{ mm}^4 \)
- Radius of gyration, \( r_x = \sqrt{\frac{I_{zz}}{A}} = 75.2 \text{ mm} \)

Material Properties
\[ F_y = 350 \text{ MPa} \]

Validation

Nominal Section Capacity Check

\[ \lambda_e = \left( \frac{d_o}{t} \right) \frac{F_y}{250} = \frac{219.1}{6.5} \times \frac{350}{250} = 47.9 \]

\[ \lambda_{ey} = 82 \]

\[ d_{e1} = d_0 \sqrt[3]{\frac{\lambda_{ey}}{\lambda_e}} = 219.1 \sqrt[3]{\frac{82}{47.9}} = 287 \leq d_o = 219.1 \text{ mm} \]

\[ d_{e1} = d_0 \left( \frac{3 \times \lambda_{ey}}{\lambda_e} \right)^2 = 219.1 \left( \frac{3 \times 82}{47.9} \right)^2 = 5,780 \text{ mm} \]

The effective depth is the minimum of \( d_{e1} \) and \( d_{e2} \) or 219.1 mm.

\[ d_i = d_e - 2 \times t = 219.1 - 2(6.4) = 206.3 \text{ mm} \]

The effective area,

\[ A_e = \pi d_e^2 - \pi d_i^2 = \pi \left( \frac{219.1}{4} \right)^2 - \pi \left( \frac{206.3}{4} \right)^2 = 4,280 \text{ mm}^2 \]

\[ K_f = \frac{A_e}{A_g} = \frac{4,280}{4,280} = 1 \]

Net area = 4,280 mm\(^2\)

Nominal section capacity:

\[ N_s = K_f \times A_n \times F_y = 1 \times 4,280 \times 350(10)^{-3} = 1,500 \text{ kN} \]

\[ \phi N_g = 0.9 \times 1,500 = 1,350 \text{ kN} \]

Axial Member Capacity

The effective length for the member pinned at both ends:

\[ l_e = K_e \times L = 1 \times 3,800 = 3,800 \text{ mm} \]

\[ \frac{l_e}{r_x} = \frac{3,800}{75.2} = 50.5 \]

Modified slenderness ratio:

\[ \lambda_n = \frac{l_e}{r_x} \sqrt{\frac{K_f F_y}{250}} = 50.5 \sqrt{\frac{1 \times 350}{250}} = 59.8 \]

The member section has a constant \( a_b \). The residual stress for cold-formed (non-stress relieved) CHS category. \( K_f = 1 \). Therefore, from AS 4100 table 6.3.3(1), \( a_b = -0.5 \).

From interpolating Table 6.6 or AS 4100 Table 6.3.3(3), the slenderness reduction factor, \( a_c = 0.863 \).

\[ N_c = a_c \times N_s = 0.863 \times 1,500 = 1,290 \text{ kN} \]

\[ N_c < N_s, \text{ OK} \]
\[ \phi N_c = 0.9 \times 1,290 = 1,160 \text{ kN} \]

---
V. AS4100 1998 - SHS section subject to compression

Verify the axial compression capacities of an SHS section beam per the AS 4100 1998 code.

Details

The member is 3.8 m in length, with pinned supports at both ends. The section is a 200 x 200 x 5.0 SHS of grade 250 steel. The member is subject to 1,030 kN in compression.

Section Properties

- Depth of section, \( b = d = 200 \text{ mm} \)
- Thickness, \( t = 5 \text{ mm} \)
- Cross-sectional area, \( A_g = 3,810 \text{ mm}^2 \)
- Radius of gyration, \( r_x = 79.2 \text{ mm} \)

Material Properties

- \( E = 199,947 \text{ MPa} \)
- \( G = 80,000 \text{ MPa} \)
- \( F_y = 250 \text{ MPa} \)
- \( F_u = 320 \text{ MPa} \)

Validation

Nominal Section Capacity

Clear width: \( b_{cw} = b - 2t = 200 - 2 \times 5 = 190 \text{ mm} \)

\[
\lambda_e = \frac{b_{cw}}{t} \sqrt{\frac{F_y}{250}} = \frac{190}{5} \sqrt{\frac{250}{250}} = 38
\]

\( \lambda_{ey} = 40 \)

Effective width, \( b_e \), for each compression element:

\[
b_e = b_{cw} \frac{\lambda_{ey}}{\lambda_e} \leq b_{cw} = 190 \sqrt[38]{40} = 195 > 190
\]

Use \( b_e = 190 \text{ mm} \)

Effective area, \( A_e = 4 \times b_e \times t = 4 \times 190 \times 5 = 3,800 \text{ mm}^2 \)
\[ K_f = \frac{A_n}{A_g} = \frac{3,800}{3,810} = 1.0 \]

Assume the net area, \( A_n \), is equal to the gross area (i.e., no holes).

The nominal section capacity:
\[ N_s = K_f A_n f_y = 1.0 \times 3,800 \times 250(10)^{-3} = 950 \text{ kN} \]
\[ \phi N_s = 0.9 \times 950 = 855 \text{ kN} \]

Axial Member Capacity

The effective length, \( l_e = K_e \times L = 1 \times 3,800 \text{ mm} = 3,800 \text{ mm} \)

The modified slenderness ratio:
\[ \lambda_n = \frac{l_e}{r} \sqrt{\frac{K_f f_y}{250}} = \frac{3,800}{79.2} \sqrt{\frac{1 \times 250}{250}} = 47.97 \]

Member section constant, \( a_b \), for shape of section, residual stress cold-formed (non-stress relieved) CHS category, and \( K_f = 1.0 \) from AS 4100 Table 6.3.3.(2): \( a_b = -0.5. \)

From linear interpolation of Table 6.3.3(3), the slenderness reduction factor, \( a_c = 0.913 \)
\[ N_c = a_c N_s = 0.913 \times 950 = 867.4 \text{ kN} \]
\[ \phi N_c = 0.9 \times 867.4 = 780.6 \text{ kN} \]

V. AS4100 1998 - Welded section subject to bending

Verify the bending capacity of a welded girder per the AS 4100 1998 code.

Details

The member is 21 m in length, with pinned supports at both ends. The section has top & bottom flanges of 450 mm × 60 mm and a web of 1,390 mm × 32 mm. The plates are all grade 280 steel. The member is subject to
major axis bending. The section is partially restrained at the supports and at the third points along the span. The point loads are applied at the top flange.

Material Properties

\[ E = 199,947 \text{ MPa} \]
\[ G = 80,000 \text{ MPa} \]
\[ F_y = 280 \text{ MPa} \]
\[ F_u = 440 \text{ MPa} \]

Validation

**Section Properties**

Depth of section, \( D = 1,390 + 2 \times 60 = 1,510 \text{ mm} \)

Cross-sectional area, \( A_g = 1,390 \times 32 + 2 \times 450 \times 60 = 98,480 \text{ mm}^2 \)

Moment of inertia about major axis:

\[
I_{zz} = \frac{b_f t_f}{12} + b_f t_f \left(\frac{d_w + t_f}{2}\right)^2 + \frac{t_w d_w^3}{12} = 2 \left[ \frac{450(60)^3}{12} + 450 \times 60 \left(\frac{1,390 + 60}{2}\right)^2 \right] + \frac{32(1,390)^3}{12} = 35.6(10)^9 \text{ mm}^4
\]

Moment of inertia about minor axis:

\[
I_{yy} = \frac{d_w t_w^3}{12} + \frac{t_f b_f^3}{12} = \frac{1,390 \times (32)^3}{12} + 2 \times \frac{60(450)^3}{12} = 915(10)^6 \text{ mm}^4
\]

Elastic section modulus, \( Z_{xx} = \frac{I_{xx}}{D^2} = \frac{35.6(10)^9}{1,510 / 2} = 47.1(10)^6 \text{ mm}^3 \)

Plastic section modulus,

\[
S_{xx} = 2 \left[ \frac{d_w^2 t_w}{8} + b_f t_f \left(\frac{d_w \cdot t_f}{2}\right) \right] = 2 \left[ \frac{(1,390)^2(32)}{8} + 450 \times 60 \left(\frac{1,390 - 60}{2}\right) \right] = 54.6(10)^6 \text{ mm}^3
\]

Warping constant:

\[
I_w = \frac{I_y (d_w + t_f)^2}{4} = \frac{915(10)^6(1,390 + 60)^2}{4} = 481(10)^{12} \text{ mm}^6
\]

Torsional constant:

\[
J = \frac{2b_f t_f^3 + d_w t_w^3}{3} = \frac{2(450)(60)^3 + 1,390(32)^3}{3} = 80.0(10)^6 \text{ mm}^4
\]

**Section Slenderness Ratio**

Flange section slenderness parameter:

\[
\frac{b}{t} = \frac{b_f \cdot t_f}{2} = \frac{450 \cdot 32}{2} = 209 \text{ mm}
\]

\[
\lambda_{ef} = \frac{b_f}{t_f} \sqrt{\frac{I_y}{250}} = \frac{209}{60} \sqrt{\frac{280}{250}} = 3.69 < \lambda_{ep} = 8
\]

Hence, the flange is compact.

Web section slenderness parameter:

\[
\lambda_{ew} = \frac{d_w}{t_w} \sqrt{\frac{I_y}{250}} = \frac{1,390}{32} \sqrt{\frac{280}{250}} = 46.0 < \lambda_{ep} = 82
\]
Hence, the web is compact.

Section Bending Capacity

\[ Z_{xx} \text{ is the lesser of } S_{xx} \text{ and } 1.5 \times Z_{xx} = 1.5(47.1 \times 10^6) = 70.7(10^6). \]

\[ M_{sx} = Z_{cx} f_y = 54.6(10^6)280(10)^6 = 15,290 \text{ kN·m} \]

\[ \phi M_{sx} = 0.9 \times 15,290 = 13,760 \text{ kN·m} \]

Member Bending Capacity

The length between braced points, \( l = 7,000 \text{ mm} \)

\[ k_t = 1 + \frac{2d}{l} \left( \frac{0.5f_y}{t_w} \right)^3 = 1 + \left( \frac{2 \times 1.390}{7,000} \right) \left( \frac{0.5 \times 60}{32} \right)^3 = 1.33 \]

Top flange load height position: \( k_l = 1.4 \). No lateral rotational restraint: \( k_r = 1.0 \).

The effective length, \( l_e = k_t k_l k_r l = 1.33 \times 1.4 \times 1.0 \times 7,000 = 13,000 \text{ mm} \).

The reference buckling moment:

\[ M_o = \pi \frac{2E I_y}{l_e^2} \left[ G J + \frac{\pi^2 E I_w}{l_e^2} \right] = \frac{3,800}{79.2} \frac{1 \times 250}{250} = \pi \frac{199,947 \times 915}{(13,000)^2} \left[ 80,000 \times 80(10)^6 + \frac{\pi^2 \times 199,947 \times 481(10)^{12}}{(13,000)^2} \right] (10)^6 = 11,330 \text{ kN·m} \]

The moment modification factor:

\[ a_m = \frac{1.7M_m}{\sqrt{(M_2)^2 + (M_3)^2 + (M_4)^2}} \]

where

\[ M_M = \text{the maximum design moment in the segment, } M_3 = 6,142.5 \text{ kN·m (from STAAD.Pro analysis)} \]

\[ M_3 = M_4 = \text{the design moment at the quarter points in the segment, } 5,862.5 \text{ kN·m (from STAAD.Pro analysis)} \]

\[ a_m = \frac{1.7 \times 6,142.5}{\sqrt{2 \times (5,862.5)^2 + (6,142.5)^2}} = 1.012 \]

The slenderness reduction factor per AS 4100 Eq. 5.6.1.1(2):

\[ a_s = 0.6 \left[ \frac{M_2^{2/3}}{M_0^{2/3}} + 3 \cdot \frac{M_3}{M_0} \right] = 0.6 \left[ \frac{15,290^{2/3}}{11,330^{2/3}} + 3 \cdot \frac{15,290}{11,330} \right] = 0.508 \]

\[ \phi M_b = \phi a_m a_s M_s = 0.9 \times 1.012 \times 0.508 \times 15,290 = 7,074 \text{ kN·m} \]

V. Canadian

V. CSA S16-01 - Axial Tension

Design of a double-angle member subject to tension load.

Reference

Related Links

- D4.B. Canadian Codes - Steel Design per CSA Standard CAN/CSA-S16-01 (on page 1412)

Problem

Design a tension diagonal in an all-welded truss. Attached to WT 265x61.5 chords (t_w = 13.1 mm).

\[ L = 4 \text{ m} \]
\[ T_f = 630 \text{ kN} \]

The material used is G40.21 300W steel (\( F_y = 300 \text{ MPa}, F_u = 450 \text{ MPa} \)) (FYLD and FU)

Calculations

Gross area is used for welded connections.
\[
T_r = \max \left\{ \phi A F_y = 0.9 \times 300 \times A = 270A \right. \\
\phi_u A F_u = 0.75 \times 450 \times A = 338A \]

\[
T_r \geq T_f, \text{ so solve for } A:
A = \frac{630 \times (10)^3}{270} = 2,333 \text{ mm}^2
\]

Select a pair of angles with at least this gross area: try a 2-76x64x9.5, with long legs back-to-back:

\[
A = 2,480 \text{ mm}^2
r_{\text{min}} = 13.3 \text{ mm}
\]

Calculate the effective net area due to shear lag. The average weld length is taken as \((120 \text{ mm} + 250 \text{ mm})/2 = 185 \text{ mm}\).

The long leg does not have a reduction in area shear lag, thus:

\[
A_{n2} = 1.00 \times (76 - 9.5) \times 9.5 = 632 \text{ mm}^2
\]

The outstanding (short) leg has an eccentricity of half the leg length, or \(64/2 = 32 \text{ mm}\).

\[
A_{n3} = \left(1 - \frac{32}{250}\right) \times 64 \times 9.5 = 530 \text{ mm}^2
\]

The total net area for the pair of angles for the rupture limit state is:

\[
A_{n} = 632 + 530 = 1,162 \text{ mm}^2
\]

For the pair of angles, \(A_{n} = 2 \times 1,162 = 2,324 \text{ mm}^2\); the ratio of net section area to gross area = 2,324 / 2,480 = 0.937 (NSF).

Checking the yielding limit state:

\[
T_r = 0.90 \times 2,480 \times 300 = 670 \text{ kN}
\]

Checking the rupture limit state:

\[
T_r = 0.75 \times 2,324 \times 450 = 784 \text{ kN}
\]

Yielding governs, and the critical ratio is: \(630/670 = 0.94\).

**Comparison**

**Table 585: Comparison of results**

</tbody>
</table>

**Note:** If the member SELECT facility is used in place of a code CHECK, STAAD.Pro will actually select a 2-L 102x89x6.4 member, which has a critical ratio of 0.997 (per Cl. 13.2) and an area of 2,340 mm\(^2\), thus more economical (the NSF used for this size is 0.923).

V. CSA S16-01 - Beam Shear Capacity

Reference

Related Links
• D4.B. Canadian Codes - Steel Design per CSA Standard CAN/CSA-S16-01 (on page 1412)

Problem
The W530x82 beam has a maximum shear force, \( v = 540 \text{ kN} \) due to factored loads.

\[ L = 11.0 \text{ m} \]

The material used is G40.21 350W steel \( (F_y = 350 \text{ MPa}) \) (FYLD)
Calculations

Evaluate the slenderness effects of the beam web:

\[ \frac{h}{w} = \frac{528 - 2(13.3)}{9.5} = 52.8 < 439 \sqrt{\frac{F_v}{F_y}} = 439 \sqrt{\frac{5.34}{350}} = 54.2 \]

Therefore the shear capacity is calculated as:

\[ V_r = \phi \times A_w \times F_y = 0.9 \times 528 \times 9.5 \times 350 = 1,043 \text{ kN} \]

Calculate Equivalent Concentrated Load

The given end moments and assumed distributed loads (which was determined to give an equivalent mid-span moment of the given example) do not result in a shear force of 540 kN. Therefore, an additional concentrated load is added near the first support.

\[ R_1 = \frac{w_f L}{2} + \frac{M_1 - M_2}{L} = \frac{40.17 \times 11.0}{2} + \frac{540 - 185}{11.0} = 253.2 \text{ kN} \]

\[ P = 540 \text{ kN} - 253.2 \text{ kN} = 287 \text{ kN} \]

The STAAD.Pro will have this load applied at 1 mm away from the left support.

V. CSA S16-01 - Cantilever with Biaxial Loading

A slender, cantilever beam subjected to a uniform load. Static analysis, 3D beam element.

Reference

Related Links
• D4.B. Canadian Codes - Steel Design per CSA Standard CAN/CSA-S16-01 (on page 1412)

Problem
A cantilever beam of length 4 meter is subjected to uniformly distributed load of 3 kN/Meter in both major and minor axis. Axial compression of 8 kN is also applied to the member. A user-defined steel section “Sect_Class-4” is assigned to the member.

Given
Design forces

- 8.0 kN (Compression)
- 6.0 kN-m (Bending-Y)
- 6.0 kN-m (Bending-Z)
- 6.0 kN (Shear-Y)
- 6.0 kN (Shear-Z)

Section Properties(Sect_Class-4):

- Area = 2,766 mm$^2$
- Depth of section, D = 150 mm
- Thickness of web $T_w$ = 7 mm
- Width of flange $B_f$ = 150 mm
- Thickness of flange $T_f$ = 6 mm
- Moment of inertia about Z axis, $I_z$ = 10.87×10$^6$ mm$^4$
- Moment of inertia about Y axis, $I_y$ = 3.38×10$^6$ mm$^4$
- Moment of inertia about X axis, $I_x$ = 37.38×10$^3$ mm$^4$
- Warping constant, $C_w$ = 17.52×10$^9$ mm$^6$
Torsion constant, \( J = \frac{2B_f T_f^3 + (D - T_f) w^3}{3} = \frac{2 \times 150 \times 6^3 + (150 - 6) 7^3}{3} = 38.06 \times 10^3 \text{mm}^4 \)

Member Length \( L = 2 \text{ m} \), Unbraced length = 100mm.

Material

\( F_y (FYLD) = 300 \text{ MPa} \)
\( E = 205,000 \text{ MPa} \)
\( G = 78,850 \text{ MPa} \)

Calculations

**Slenderness Ratio**

Effective Length factor along Local Y-Axis = \( KY = 1 \)

Effective Length factor along Local Z-Axis = \( KZ = 1 \)

Slenderness ratio about Z axis, \( L/R_z = 31.9 \)

Slenderness ratio about Y axis, \( L/R_y = 57.22 \)

Maximum Slenderness Ratio, \( L/R_{max} = 57.22 \)

**Section Classification**

\( B_f / T_f = 150 \times 0.5 / 6 = 12.5 > \frac{200}{\sqrt{F_y}} = 11.54 \)

Flange is Class 4.

\( d/T_w = (150 - 2.0 \times 6)/7 = 19.7 \)

\[ \frac{1.100}{\sqrt{F_y}} \left( 1 - 0.39 \frac{C_f}{\phi C_y} \right) = \frac{1.100}{\sqrt{300}} \left( 1 - 0.39 \frac{8,000}{0.9 \times 2,766 \times 300} \right) = 63.5 \]

Web is Class 1.

Overall section is Class 4 section.

**Check against axial compression (Clause 13.3.3)**

Effective width, \( B_{eff} = 200 \times \frac{T_f}{\sqrt{F_y}} = 69.24 \)

Effective area, \( A_{eff} = 69.24 \times 6 \times 4 + (150 - 2 \times 6) \times 7 = 2,628 \text{mm}^4 \).

Effective yield stress, \( F_{y,eff} = \frac{40,000}{(0.5 \times B_f / T_f)^4} = 256 \text{MPa} \).

As per Clause 13.3.3(a),

Elastic critical buckling, \( F_e = \frac{\pi^4 \times E}{L_{Rmax}^4} = 617.956 \text{MPa} \).

Non-dimensional slenderness ratio, \( \lambda = \sqrt{\frac{F_y}{F_e}} = 0.697 \)
Axial compressive resistance, \( C_r = \phi A_{\text{eff}} \times F_y \times \left[ 1 + 0.697^{(2 \times 1.34)} \right]^{(-1/1.34)} \) = 557.9 kN.

As per Clause 13.3.3(b),

Elastic critical buckling, \( F_{e} = \pi^4 \times E / L_{Rmax}^4 \) = 617.956 MPa.

Effective non-dimensional slenderness ratio, \( \lambda = \frac{F_y}{F_e} = 0.697 \)

Axial compressive resistance, \( C_r = \phi \times A \times F_{y,\text{eff}} \times \left[ 1 + 0.644^{(2 \times 1.34)} \right]^{(-1/1.34)} \) = 521.8 kN.

Axial compressive resistance = \( \min(557.9, 521.8) \) = 521.8 kN.

Check against bending (Clause 13.5(c))

As the web of the section meets the requirement of Class 3 and flange exceeds Class 3 limit, flexural resistance should be calculated as per clause 13.5(c).iii.

Effective moment of inertia about Z axis,
\[
I_{z,\text{eff}} = 2 \times \frac{2 \times 69.24 \times 6^3}{12} + 2 \times \frac{2 \times 69.24 \times 6 \times (150 - 6)^3}{4} + \frac{7 \times (150 \times 2 \times 6)^3}{12} = 10.15 \times (10)^6 \text{ mm}^4
\]

Effective section modulus about Z axis,
\[
S_{z,\text{eff}} = 10.15 \times (10)^6 \times \frac{2}{150} = 135.4 \times (10)^3 \text{ mm}^3
\]

Effective moment of inertia about Y axis,
\[
I_{y,\text{eff}} = 2 \times 6 \times (2 \times 69.24)^3 + 0.5 \left(150 \times 6\right)^3 = 2.658 \times (10)^6 \text{ mm}^4
\]

Effective section modulus about Y axis,
\[
S_{y,\text{eff}} = 2.658 \times (10)^6 / 69.24 = 38.38 \times (10)^3 \text{ mm}^3
\]

Major axis bending resistance if member is laterally supported,
\[
M_{rz1} = \phi S_{z,\text{eff}} F_y = 0.9 \times 135.4 \times (10)^3 \times 300 = 36.55 \text{ kN} \cdot \text{m}
\]

Minor axis bending resistance,
\[
M_{ry} = \phi S_{y,\text{eff}} F_y = 0.9 \times 38.38 \times (10)^3 \times 300 = 10.36 \text{ kN} \cdot \text{m}
\]

If the member is laterally unsupported major axis bending resistance is determined by clause 13.6(b).

As the value of one of the end moments is 0.0, \( \omega_2 = 1.75 \).

Where, as per clause 13.6(a),
\[
EI_y GJ = 205,000 \times 38.8 (10)^6 \times 78,850 \times 38.06 (10)^3 = 23.87 \times 10^{21} \text{ MPa}^2 \text{ mm}^8
\]
\[
\left( \frac{nE}{L} \right)^2 I_y C_w = \left( \frac{n \times 205,000}{2,000} \right)^2 3.38 \times 10^6 \times 17.52 \times 10^9 = 6.14 \times 10^{21} \text{ MPa}^2 \cdot \text{ mm}^8
\]
\[
M_u = \frac{\omega_2 n}{L} \sqrt{EI_y GJ + \left( \frac{nE}{L} \right)^2 I_y C_w}
\]
\[
= \frac{1.75 \times n}{2,000} \sqrt{23.87 \times 10^{21} + 6.14 \times 10^{21}} = 476.2 \times 10^6 \text{ N mm} = 476.2 \text{ kN m}
\]
\[ M_y = SyF_y = \frac{10.87(10^6 \times 2)}{150} \times 300 = 43.48 \text{ kN m} \]

Since \( M_y > 0.65 \times M_y = 28.26 \), Moment of resistance

\[ M_{r2} = 1.15 \times 0.9 \times 43.48 \times \left(1 - \frac{0.28}{248} \right) = 42.79 \text{ kN m} \]

\( M_{r2} \) should not be more than \( M_{r1} \). Since, \( M_{r2} > M_{r1} \) in this example, \( M_{r2} = M_{r1} \).

\[ M_{r2} = 36.55 \text{ kN-m} \]

V. CSA S16-01 - Shear Capacity Combined Stresses

Reference

Related Links
- D4.B. Canadian Codes - Steel Design per CSA Standard CAN/CSA-S16-01 (on page 1412)

Problem
The W250x73 column has the following concentrated loads

\[ C_f = 900 \text{ kN} \]

And a uniform moment of:

\[ M_{fx} = 180 \text{ kN m} \]
The material used is G40.21 350W steel (\(F_y = 350 \text{ MPa}\)) (FYLD). The beam is braced against lateral-torsional buckling only at the ends (LAT 0, default)

Calculations

Axial Capacity

Determine the buckling load of the column:

\[
\left(\frac{KL}{r}\right)_x = \frac{1.063, 600}{110} = 32.7
\]

\[
\left(\frac{KL}{r}\right)_y = \frac{1.063, 600}{64.6} = 55.7
\]

The largest slenderness ratio controls:

\[
F_{ex} = \frac{n^2 E}{KLr_x^2} = \frac{n^2 (200, 000)}{(55.7)^2} = 635.6 \text{ kN}
\]

\[
\lambda = \sqrt{\frac{F_{ey}}{F_{ex}}} = \sqrt{\frac{350}{635.6}} = 0.742
\]

\[
C_r = \phi A F_y \left(1 + \lambda^{2n}\right)^{-1/n} = 0.90 \times 9, 280 \times 350 \left[1 + 0.742^{(2 \times 1.34)}\right]^{-1/1.34} = 2, 216 \times (10)^6 \text{ N} = 2, 216 \text{ kN}
\]

Moment Modifier

Uniform moment:

\[
\omega_1 = 1.0
\]

Calculate the elastic buckling load for the bending axis:

\[
C_e = \frac{n^2 \times 200, 000 \times 113 \times 10^6}{(1.0 \times 3, 600)^2} = 17, 211 \text{ kN}
\]

\[
U_{1x} = \frac{1.0}{1 - \frac{900}{17, 211}} = 1.06
\]

Bending Capacity

\[
\omega_2 = 1.0
\]

\[
EI_y GJ = 200,000 \times 38.8 \times 76.92 \times 575 = 343.2 \times 10^{21} \text{ MPa}^2 \cdot \text{mm}^8
\]

\[
\left(\frac{nE}{L}\right)^2 I_y C_w = \left(\frac{n \times 200, 000}{3, 600}\right)^2 38.8 \times 553 = 653.6 \times 10^{21} \text{ MPa}^2 \cdot \text{mm}^8
\]

\[
M_u = \frac{\omega_2 n}{L} \sqrt{EI_y GJ + \left(\frac{nE}{L}\right)^2 I_y C_w}
\]

\[
= \frac{1.0 \times n}{3, 600} \sqrt{343.2 \times 10^{21} + 653.6 \times 10^{21}} = 871 \times 10^6 \text{ N mm} = 871 \text{ kN m}
\]

Plastic moment capacity:

\[
M_p = Z_x F_y = 985 \times 10^3 \times 350 = 345 \times 10^6 \text{ N mm} = 345 \text{ kN m}
\]
\[ M_u = 871 \text{ kN·m} > 0.67 \times M_p = 0.67 \times 345 = 231 \text{ kN·m} \]

Therefore, the moment capacity is calculated as:

\[ M_r = 1.15 \phi M_p \left( 1 - \frac{0.28 M_p}{M_u} \right) = 1.15 \times 0.9 \times 345 \left( 1 - \frac{0.28 \times 345}{871} \right) = 317 \text{ kN·m} \]

Check the capacity based on the strength cross-section:

\[ M_{rx} = 0.9 \times 985 \times 10^3 \times 350 = 310 \text{ kN·m} \]

This governs capacity.

**Combined Stress Ratio**

\[ \frac{900}{2,216} + \frac{0.85 \times 1.06 \times 180}{310} = 0.406 + 0.523 = 0.929 < 1.0 \]

V. CSA S16-01 - Short Column Compression

Determine the factored compressive resistance of a short column.

Reference

Related Links
- *D4.B. Canadian Codes - Steel Design per CSA Standard CAN/CSA-S16-01* (on page 1412)

Problem
A W250x73 section is used for a pedestal with a height of 1.1 m.
The material used is G40.21 350W steel \((F_y = 350 \text{ MPa})\) (FYLD)

Calculations
The nominal yield strength is used for the actual yield strength for a Group 2 section, per Table 3 and Table 4 of Appendix A of the reference.

Local Element Buckling
Evaluate the slenderness effects of the column web:
\[
\frac{h}{w} = \frac{225}{8.6} = 26.2 < \frac{670}{\sqrt{350}} = 35.8
\]

Evaluate the slenderness effects of the column flanges:
\[
\frac{b}{2t} = \frac{254}{2 \times 14.2} = 8.9 < \frac{200}{\sqrt{350}} = 10.7
\]
Both the column web and flanges are less than the local buckling limit, so the capacity of the column is evaluated using Eq. 4.21.

**Column Capacity**
Assume $K = 1.0,$

$$\frac{L}{r_x} = \frac{1.100}{110} = 10$$

$$\frac{L}{r_y} = \frac{1.100}{64.6} = 17.03$$

The largest slenderness ration controls, thus the slenderness factor for buckling about the minor axis:

$$F_e = \frac{\pi^2 E}{L k L / r_y} = \frac{\pi^2 205 \times 10^3}{1 \times 17.03} = 6, 978 \text{ kN}$$

$$\lambda = \sqrt{\frac{F_y}{F_e}} = \sqrt{\frac{350}{6,978}} = 0.224$$

When $n = 1.34$ (Group 2 W shape),

$$C_r = \phi AF_y \left(1 + \lambda^{2n}\right)^{-1/n} = 0.90 \times 9, 280 \times 350 \left[1 + 0.224^{(2 \times 1.34)}\right]^{-1/1.34} = 2.884 \times (10)^6 \text{ N} = 2, 884 \text{ kN}$$

V. CSA S16-01 - Slender Column Compression

Determine the factored compressive resistance of a slender column.

Reference
Example 4.2

Related Links
• D4.B. Canadian Codes - Steel Design per CSA Standard CAN/CSA-S16-01 (on page 1412)

Problem
A W250x73 section is used for a pedestal with a height of 11.0 m.
The material used is G40.21 350W steel ($F_y = 350$ MPa) (FYLD)

Calculations
The nominal yield strength is used for the actual yield strength for a Group 2 section, per Table 3 and Table 4 of Appendix A of the reference.

Local Element Buckling
Evaluate the slenderness effects of the column web:

$$\frac{h}{w} = \frac{225}{8.8} = 26.2 < \frac{670}{\sqrt{350}} = 35.8$$

Evaluate the slenderness effects of the column flanges:

$$\frac{b}{2t} = \frac{254}{2 \times 14.2} = 8.9 < \frac{200}{\sqrt{350}} = 10.7$$

Both the column web and flanges are less than the local buckling limit, so the capacity of the column is evaluated using Eq. 4.21.
Column Capacity
Assume $K = 1.0$,
\[
\frac{L_{rx}}{110} = 11,000 = 100
\]
\[
\frac{L_{ry}}{64.8} = 11,000 = 170.3
\]
The largest slenderness ration controls, thus the slenderness factor for buckling about the minor axis:
\[
F_e = \frac{\pi^2 \times 205,000}{(1.0 \times 170.3)^2} = 69.78 \text{ kN}
\]
\[
\lambda = \sqrt{\frac{F_y}{F_e}} = \sqrt{\frac{350}{69.78}} = 2.24
\]
When $n = 1.34$ (Group 2 W shape),
\[
C_r = \phi A F_y (1 + \lambda^{2n})^{-1/n} = 0.90 \times 9, 280 \times 350 \left[1 + 2.24^{(2\times1.34)}\right]^{-1/1.34} = 0.529 \times (10)^6 \text{ N} = 537.3 \text{ kN}
\]

### Miscellaneous Information

- Net section factor for tension: 1.000
- KL/Ry = 47.714, KL/Rz = 27.326, Allowable KL/R = 200.000
- Unsupported length of the compression flange (M) = 3.700
- Omega-1 (Y-axis) = 1.00, Omega-1 (Z-axis) = 0.40, Omega-2 = 1.00
- Shear force (KNS): Y axis = 1.351E+02, Z axis = 0.000E+00
- Slenderness ratio of web (H/W) = 2.32E+01

### V. CSA S16-01 - Wide Flange Beam Interaction Ratio 3

#### Reference

#### Related Links
- [D4.B. Canadian Codes - Steel Design per CSA Standard CAN/CSA-S16-01](on page 1412)

#### Problem

Find the interaction ratio, beam, and column resistance.

#### Given

- \( E = 200,000 \text{ MPa (STEEL)} \)
- \( F_y = 345 \text{ MPa (ASTM A992)} \)

Simply supported beam/column has a 3.7 m span, \( K_y = 1.0, K_z = 1.0, L_u = 3.7 \text{ m} \)

The factored axial load is 2,000 kN and end moments of 200 kN·m and 300 kN·m in the strong axis and 50 kN·m at each end in the weak axis.

Steel section is W310X129.

V.CSA S16-09 - Axial Tension

Design of a double-angle member subject to tension load.

Reference

Related Links

- *D4.E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19* (on page 1440)

Problem

Design a tension diagonal in an all-welded truss (SNU 0 for welded). Attached to WT 265x61.5 chords (t_w = 13.1 mm).

L = 4 m

T_f = 630 kN

The material used is G40.21 300W steel (F_y = 300 MPa, F_u = 450 MPa) (FYLD and FU)
Calculations

Gross area is used for welded connections.

\[
T_r = \max \begin{cases} \phi A F_y = 0.9 \times 300 \times A = 270A \\ \phi_u A F_u = 0.75 \times 450 \times A = 338A \end{cases}
\]

\[T_r \geq T_f\], so solve for \(A\):

\[A = \frac{630 \times (10)^3}{270} = 2,333 \text{ mm}^2\]

Select a pair of angles with at least this gross area: try a 2-76x64x9.5, with long legs back-to-back:

\[A = 2,480 \text{ mm}^2\]

\[r_{\text{min}} = 13.3 \text{ mm}\]

Calculate the effective net area due to shear lag. The average weld length is taken as \((120 \text{ mm} + 250 \text{ mm})/2 = 185 \text{ mm}\).

The long leg does not have a reduction in area shear lag, thus:

\[A_{n2} = 1.00 \times (76 \cdot 9.5) \times 9.5 = 632 \text{ mm}^2\]

The outstanding (short) leg has an eccentricity of half the leg length, or \(64/2 = 32 \text{ mm}\).

\[A_{n3} = \left(1 - \frac{32}{250}\right) \times 64 \times 9.5 = 530 \text{ mm}^2\]

The total net area for the pair of angles for the rupture limit state is:

\[A_{ne} = 632 + 530 = 1,162 \text{ mm}^2\]

For the pair of angles, \(A_{ne} = 2 \times 1,162 = 2,324 \text{ mm}^2\); the ratio of net section area to gross area = 2,324 / 2,480 = 0.937 (NSF).

Checking the yielding limit state:

\[T_r = 0.90 \times 2,480 \times 300 = 670 \text{ kN}\]

Checking the rupture limit state:

\[T_r = 0.75 \times 2,324 \times 450 = 784 \text{ kN}\]

Yielding governs, and the critical ratio is: \(630/670 = 0.94\).

Comparison

</table>

**Note:** If the member SELECT facility is used in place of a code CHECK, STAAD.Pro will actually select a 2-L 102x89x6.4 member, which has a critical ratio of 0.997 (per Cl. 13.2) and an area of 2,340 mm², thus more economical (the NSF used for this size is 0.923).

V.CSA S16-09 - Beam Bending

Determine the uniformly factored load that the member can resist.

Reference
Example 5.1

Related Links
- D4.E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19 (on page 1440)

Problem
A W310x52 beam spans 7.3 m. Both ends of the beam are supported by columns connected standard web angle connections.

The material used is G40.21 350W steel ($F_y = 350$ MPa) (FYLD)

Calculations
The nominal yield strength is used for the actual yield strength for a Group 2 section, per Table 3 and Table 4 of Appendix A of the reference.

Section Classification
Evaluate the slenderness effects of the beam flanges:

$$\frac{b}{2t} = \frac{167}{2 \times 13.2} = 6.3 < \frac{170}{\sqrt{350}} = 9.1$$

Evaluate the slenderness effects of the beam web:

$$\frac{h}{w} = \frac{318 - 2(13.2)}{7.6} = 38.4 < \frac{1,700}{\sqrt{350}} = 90.9$$

Both the beam flanges and web are less than the local buckling limit, so the capacity of the column is evaluated using Eq. 5.7.

Bending Capacity
Factored moment resistance is:

$$M_r = \phi Z_x F_y = 0.90 \times 841 \times (10)^3 \times 350 = 265 \times (10)^3 \text{N}\cdot\text{mm} = 265 \text{kN}\cdot\text{m}$$

Equate this to the bending moment due to a uniformly distributed load and solve for the load:

$$M_r \geq \frac{w_f L^2}{8}$$

$$w_f = \frac{8M_r}{L^2} = \frac{8 \times 265}{(7.3)^2} = 39.8 \text{kN/m}$$

</tbody>
</table>

**Note:** (*) STAAD.Pro does calculate the allowable uniform load on the beam. Instead, this is done by applying a uniform load incrementally until the critical ratio is \(\approx 1.0\). The, this uniform load is divided by the resulting critical ratio to normalize the distributed load capacity of the beam. Thus, \(39.8/1.001 = 39.67 \text{ kN/m}\)

V.CSA S16-09 - Beam Shear Capacity

Reference

Related Links
• D4.E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19 (on page 1440)

Problem
The W530x82 beam has a maximum shear force, \( v = 540 \text{ kN} \) due to factored loads.
\[ L = 11.0 \text{ m} \]
The material used is G40.21 350W steel (\( F_y = 350 \text{ MPa} \)) (FYLD)

Calculations
Evaluate the slenderness effects of the beam web:
\[
\frac{h}{w} = \frac{528 - 2(13.3)}{9.5} = 52.8 < 439\sqrt{\frac{F_y}{F_{yld}}} = 439\sqrt{\frac{350}{350}} = 54.2
\]
Therefore the shear capacity is calculated as:
\[
V_r = \phi \times A_w \times F_y = 0.9 \times 528 \times 9.5 \times 350 = 1,043 \text{ kN}
\]

Calculate Equivalent Concentrated Load
The given end moments and assumed distributed loads (which was determined to given an equivalent mid-span moment of the given example) do not result in a shear force of 540 kN. Therefore, an additional concentrated load is added near the first support.
\[
R_1 = \frac{w \cdot L}{2} + \frac{M_1 - M_2}{L} = \frac{40.17 \times 11.0}{2} + \frac{540 - 185}{11.0} = 253.2 \text{ kN}
\]
\[
P = 540 \text{ kN} \times 253.2 \text{ kN} = 287 \text{ kN}
\]
The STAAD.Pro will have this load applied at 1 mm away from the left support.
### Comparison

V.CSA S16-09 - Select a Beam

Select a wide-flange shape for the given beam span.

Reference

Related Links
• *D4.E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19* (on page 1440)

Problem
A beam must be selected to span 11.0 m. The end moment of the span are:

\[ M_1 = -540 \text{ kN} \cdot \text{m} \]
\[ M_2 = -185 \text{ kN} \cdot \text{m} \]

And the maximum moment in the span is:

\[ M_3 = 256 \text{ kN} \cdot \text{m} \]

The beam is braced at 2.5 m from the center of each supporting column (thus \( L_b = 6.0 \text{ m} \)) (LT 6.0). The material used is G40.21 350W steel (\( F_y = 350 \text{ MPa} \)) (FYLD)

Calculations
Assume a Class 2 section:

\[ M_r = \phi M_p = \phi Z_x F_y \]

Thus,

\[ Z_x \geq \frac{540 \times (10)^6}{0.9 \times 350} = 1,714 \times (10)^3 \text{ mm}^3 \]

Try a W460x82:

\[ Z_x = 1,830 \times (10)^3 \text{ mm}^3, \ tf = 16.0 \text{ mm}, \ bf = 191.0 \text{ mm}, \ tw = 9.9 \text{ mm}, \ D = 460.0 \text{ mm} \]

Evaluate the slenderness effects of the beam flanges:
Evaluate the slenderness effects of the beam web:

\[
\frac{b}{2t} = \frac{191}{2 \times 16.0} = 5.7 < \frac{170}{\sqrt{350}} = 9.1
\]

Evaluate the slenderness effects of the beam web:

\[
\frac{h}{w} = \frac{460 - 2(16.0)}{9.9} = 43.2 < \frac{1.700}{\sqrt{350}} = 90.9
\]

The assumptions are valid and this beam is sufficient to support the given moments.

\[M_r = 0.9 \times 1,830 \times (10\times350 \times [(10)^6]) = 576.5 \text{ kN} \cdot \text{m}\]

\[
\text{Ratio} = \frac{540}{576.5} = 0.937
\]

**Notes:**

*The reference also tries a W530x82, which is stiffer for the same weight. STAAD.Pro selects the shallower beam.

**The reference does not calculate the resisting moment capacity nor the critical ratio for either section size, but they are evaluated here for completeness.

**STAAD.Pro Input File**

The file C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Canada\S16 2009\CSA S16-09 - Select a Beam.STD is typically installed with the program.

In order to model this beam in STAAD.Pro, we need to determine the distributed load which would result in the same mid-span moment on a beam with the given end moments. From the AISC Steel Construction Manual, p 3-222:

\[
M_3 = \frac{w_f L^2}{8} - \frac{(M_1 + M_2)}{2} + \frac{(M_1 - M_2)^2}{2w_f L^2}
\]

\[
256 = \frac{w_f (11.0)^2}{8} - \frac{(540 + 185)}{2} + \frac{(540 - 185)^2}{2w_f (11.0)^2}
\]

Solving this yields \(w_f = 40.033 \text{ kN/m}\)

Reference  
Example 8.6
Problem
The W250x73 column has the following concentrated loads
\[ C_f = 900 \text{ kN} \]
And a uniform moment of:
\[ M_{fx} = 180 \text{ kN m} \]
The material used is G40.21 350W steel \((F_y = 350 \text{ MPa})\) (FYLD). The beam is braced against lateral-torsional buckling only at the ends (LAT 0, default)

Calculations

Axial Capacity
Determine the buckling load of the column:
\[
\begin{align*}
\left( \frac{KL}{r} \right)_x &= \frac{1.0(3, 600)}{110} = 32.7 \\
\left( \frac{KL}{r} \right)_y &= \frac{1.0(3, 600)}{64.6} = 55.7
\end{align*}
\]
The largest slenderness ratio controls:
\[
F_{ex} = \frac{n^2E}{\left( \frac{KL}{r} \right)_x^2} = \frac{n^2(200, 000)}{(55.7)^2} = 635.6 \text{ kN}
\]
\[
\lambda = \sqrt{\frac{F_y}{F_{ey}}} = \sqrt{\frac{350}{635.6}} = 0.742
\]
\[
C_r = \phi AF_y \left(1 + \lambda^{2n}\right)^{-1/n} = 0.90 \times 9, 280 \times 350\left[1 + 0.742^{(2\times 1.34)}\right]^{-1/1.34} = 2, 216 \times (10)^6 \text{ N} = 2, 216 \text{ kN}
\]

Moment Modifier
Uniform moment:
\[ \omega_1 = 1.0 \]
Calculate the elastic buckling load for the bending axis:
\[
C_e = \frac{n^2 \times 200, 000 \times 113 \times 10^6}{(1.0 \times 3, 600)^2} = 17, 211 \text{ kN}
\]
\[
U_{1x} = \frac{1.0}{900} = 1.06
\]

Bending Capacity
\[ \omega_2 = 1.0 \]
\[
EI_y GJ = 200,000 \times 38.8 \times 76.92 \times 575 = 343.2 \times 10^{21} \text{ MPa}^2 \text{ mm}^8
\]
\[
\left(\frac{\pi E}{L}\right)^2 I_y C_w = \left(\frac{\pi \times 200,000}{3,600}\right)^2 38.8 \times 553 = 653.6 \times 10^{21} \text{ MPa}^2 \cdot \text{mm}^8
\]

\[
M_u = \frac{\omega \pi^2}{L} \sqrt{EI_y GJ + \left(\frac{\pi E}{L}\right)^2 I_y C_w} = \frac{1.0 \times \pi}{3,600} \sqrt{343.2 \times 10^{21} + 653.6 \times 10^{21}} = 871 \times 10^6 \text{ N mm} = 871 \text{ kN m}
\]

Plastic moment capacity:

\[
M_p = Z_x F_y = 985 \times 10^3 \times 350 = 345 \times 10^6 \text{ N mm} = 345 \text{ kN m}
\]

\[
M_u = 871 \text{ kN m} > 0.67 \times M_p = 0.67 \times 345 = 231 \text{ kN m}
\]

Therefore, the moment capacity is calculated as:

\[
M_r = 1.15 \phi M_p \left(1 - \frac{0.28 M_p}{M_u}\right) = 1.15 \times 0.9 \times 345 \left(1 - \frac{0.28 \times 345}{871}\right) = 317 \text{ kN m}
\]

Check the capacity based on the strength cross-section:

\[
M_{rx} = 0.9 \times 985 \times 10^3 \times 350 = 310 \text{ kN m}
\]

This governs capacity.

**Combined Stress Ratio**

\[
\frac{900}{2,216} + \frac{0.85 \times 1.06 \times 180}{310} = 0.406 + 0.523 = 0.929 < 1.0
\]

**Note:** Both the reference and hand calculations agree with the STAAD.Pro results that the section is adequate. The reference however neglects to account for section capacity checks, which control in this case.
**STAAD.Pro Input File**

The file C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Canada\S16 2009\CSA S16-09 - Shear Capacity Combined Stresses.STD is typically installed with the program.

V.CSA S16-09 - Short Column Compression

Determine the factored compressive resistance of a short column.

Reference

Related Links
• D4.E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19 (on page 1440)

Problem
A W250x73 section is used for a pedestal with a height of 1.1 m.
The material used is G40.21 350W steel ($F_y = 350$ MPa) (FYLD)

Calculations
The nominal yield strength is used for the actual yield strength for a Group 2 section, per Table 3 and Table 4 of Appendix A of the reference.

Local Element Buckling
Evaluate the slenderness effects of the column web:
\[
\frac{h}{w} = \frac{225}{8.6} = 26.2 < \frac{670}{\sqrt{350}} = 35.8
\]
Evaluate the slenderness effects of the column flanges:
\[
\frac{b}{2t} = \frac{254}{2 \times 14.2} = 8.9 < \frac{200}{\sqrt{350}} = 10.7
\]
Both the column web and flanges are less than the local buckling limit, so the capacity of the column is evaluated using Eq. 4.21.

Column Capacity
Assume $K = 1.0$,
\[
\frac{L}{r_x} = \frac{1.100}{110} = 10
\]
\[
\frac{L}{r_y} = \frac{1.100}{64.8} = 17
\]
The largest slenderness ration controls, thus the slenderness factor for buckling about the minor axis:
\[ \lambda = \left( \frac{KL}{r} \right)_{\text{max}} \sqrt{\frac{F_y}{\pi^2 E}} = 17 \sqrt{\frac{350}{\pi^2 200,000}} = 0.227 \]

When \( n = 1.34 \) (Group 2 W shape),

\[ C_r = \phi A F_y \left( 1 + \lambda^{2n} \right)^{-1/n} = 0.90 \times 9, \ 280 \times 350 \left[ 1 + 0.227^{(2 \times 1.34)} \right]^{-1/1.34} = 2.883 \times (10)^6 \text{ N} = 2,883 \text{ kN} \]

V.CSA S16-09 - Slender Column Compression

Determine the factored compressive resistance of a slender column.

Reference

Example 4.2

Related Links
- D4.E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19 (on page 1440)

Problem
A W250x73 section is used for a pedestal with a height of 11.0 m.
The material used is G40.21 350W steel ($F_y = 350$ MPa) (FYLD)

Calculations
The nominal yield strength is used for the actual yield strength for a Group 2 section, per Table 3 and Table 4 of Appendix A of the reference.

Local Element Buckling
Evaluate the slenderness effects of the column web:
\[ \frac{h}{w} = \frac{225}{8.6} = 26.2 < \frac{670}{\sqrt{350}} = 35.8 \]
Evaluate the slenderness effects of the column flanges:
\[ \frac{b}{2t} = \frac{254}{2 \times 14.2} = 8.9 < \frac{200}{\sqrt{350}} = 10.7 \]
Both the column web and flanges are less than the local buckling limit, so the capacity of the column is evaluated using Eq. 4.21.

**Column Capacity**

Assume $K = 1.0$,

$$\frac{L}{r_x} = \frac{11,000}{110} = 100$$

$$\frac{L}{r_y} = \frac{11,000}{64.6} = 170$$

The largest slenderness ration controls, thus the slenderness factor for buckling about the minor axis:

$$F_e = \frac{\pi^2 \times 200,000}{(1.0 \times 170)^2} = 68.3 \text{ kN}$$

$$\lambda = \sqrt{\frac{F_y}{F_e}} = \sqrt{\frac{350}{68.3}} = 2.26$$

When $n = 1.34$ (Group 2 W shape),

$$C_r = \phi A F_y \left(1 + \lambda^{2n}\right)^{-1/n} = 0.90 \times 9,280 \times 350 \left[1 + 2.26^{(2 \times 1.34)} \right]^{-1/1.34} = 0.529 \times (10)^6 \text{ N} = 529 \text{ kN}$$

V.CSA S16-09 - Wide Flange Capacity Combined Stresses

Check the capacity of a wide-flange column under combined stresses.

Reference

Related Links
- D4E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19 (on page 1440)

Problem
The W250x73 column has the following concentrated loads applied at the top of the column:

\[ C_f = 900 \text{ kN} \]
\[ M_{fx} = 180 \text{ kN m} \]
The material used is G40.21 350W steel ($F_y = 350 \text{ MPa}$) (FYLD). The column is assumed to be braced laterally against lateral-torsional buckling (LAT 1).

$L = 3.6 \text{ m}$

**Calculations**

**Local Element Buckling**

Evaluate the slenderness effects of the column web:

$$\frac{h}{w} = \frac{225}{8.6} = 26.2 < \frac{670}{\sqrt{350}} = 35.8$$

Evaluate the slenderness effects of the column flanges:

$$\frac{b}{2t} = \frac{254}{2 \times 14.2} = 8.9 < \frac{200}{\sqrt{350}} = 10.7$$

Both the column web and flanges are less than the local buckling limit, so the capacity of the column is evaluated using Eq. 4.21.

**Axial Capacity**

Determine the buckling load of the column, assuming that weak axis buckling will not control due to bracing:

$$\left( \frac{KL}{r} \right)_x = \frac{1.0(3, 600)}{110} = 32.7$$

The largest slenderness ratio controls:

$$F_{ex} = \frac{n^2 E}{KL_r} \left( \frac{KL}{r} \right)_x^2 = \frac{n^2 (200, 000)}{(32.7)^2} = 1, 847 \text{ kN}$$

$$\lambda = \sqrt{\frac{F_{ex}}{F_{ey}}} = \sqrt{\frac{350}{1, 847}} = 0.435$$

$$C_r = \phi AF_y (1 + \lambda^{2n})^{-1/n} = 0.90 \times 9, 280 \times 350[1 + 0.435(2 \times 1.34)]^{-1/1.34} = 2, 716 \times (10)^6 \text{ N} = 2, 716 \text{ kN}$$

**Moment Modifier**

$$\kappa = -0/180 = 0$$

$$\omega_1 = 0.6 - 0.4\kappa = 0.6 \leq 1.0$$

Calculate the elastic buckling load for the bending axis:

$$C_e = \frac{n^2 \times 200, 000 \times 113 \times 10^6}{(1.0 \times 3, 600)^2} = 17, 211 \text{ kN}$$

$$U_{1x} = \frac{0.6}{1 - \frac{900}{17 \times 210}} = 0.633$$

**Bending Capacity**

From a previous example, the W250x73 is a Class 2 section. It is laterally supported along its length, thus:
\[ M_{tx} = 0.9 \times 985 \times 10^3 \times 350 = 310 \text{ kN m} \]

**Combined Stress Ratio**

\[
\frac{900}{2,716} + \frac{0.85 \times 0.633 \times 180}{310} = 0.331 + 0.312 = 0.644 < 1.0
\]

This is the check for overall member strength. However, there is another case that actually controls in this instance: checking for cross sectional strength.

\[ C_r = 0.9 \times 9,280 \times 350 = 2,923 \text{ kN} \]

\[ U_{1x} = 1.0 \]

\[
\frac{900}{2,923} + \frac{0.85 \times 1.0 \times 180}{310} = 0.308 + 0.494 = 0.801 < 1.0
\]

**Comparison**

**Note:** Both the reference and hand calculations agree with the STAAD.Pro results that the section is adequate. The reference however neglects to account for section capacity checks, which control in this case.

### V. CSA S16-14 - Axial Tension

Design of a double-angle member subject to tension load.

**Reference**

**Related Links**

- [D4.E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19](on page 1440)

**Problem**

Design a tension diagonal in an all-welded truss (SNU 0 for welded). Attached to WT 265x61.5 chords (t_w = 13.1 mm).

\[
L = 4 \text{ m} \\
T_f = 630 \text{ kN}
\]

The material used is G40.21 300W steel \((F_y = 300 \text{ MPa}, F_u = 450 \text{ MPa})\) (FYLD and FU)

**Calculations**

Gross area is used for welded connections.
\[ T_r = \max \left\{ \phi AF_y = 0.9 \times 300 \times A = 270A, \phi_u AF_u = 0.75 \times 450 \times A = 338A \right\} \]

\[ T_r \geq T_f, \text{ so solve for } A: \]
\[ A = \frac{630 \times (10)^3}{270} = 2,333 \text{ mm}^2 \]

Select a pair of angles with at least this gross area: try a 2-76x64x9.5, with long legs back-to-back:
\[ A = 2,480 \text{ mm}^2 \]
\[ r_{\text{min}} = 13.3 \text{ mm} \]

Calculate the effective net area due to shear lag. The average weld length is taken as \((120 \text{ mm} + 250 \text{ mm})/2 = 185 \text{ mm}\).

The long leg does not have a reduction in area shear lag, thus:
\[ A_{n2} = 1.00 \times (76 \times 9.5) \times 9.5 = 632 \text{ mm}^2 \]

The outstanding (short) leg has an eccentricity of half the leg length, or \(64/2 = 32 \text{ mm}\).
\[ A_{n3} = \left(1 - \frac{32}{250}\right) \times 64 \times 9.5 = 530 \text{ mm}^2 \]

The total net area for the pair of angles for the rupture limit state is:
\[ A_{ne} = 632 + 530 = 1,162 \text{ mm}^2 \]

For the pair of angles, \(A_{ne} = 2\times 1,1162 = 2,324 \text{ mm}^2\); the ratio of net section area to gross area = \(2,324 / 2,480 = 0.937 \) (NSF).

Checking the yielding limit state:
\[ T_r = 0.90 \times 2,480 \times 300 = 670 \text{ kN} \]

Checking the rupture limit state:
\[ T_r = 0.75 \times 2,324 \times 450 = 784 \text{ kN} \]

Yielding governs, and the critical ratio is: \(630/670 = 0.94\).

**Comparison**

<table>
<thead>
<tr>
<th>Criteria</th>
<th>Reference</th>
<th>STAAD.Pro</th>
<th>Difference</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>Critical Ratio</td>
<td>0.94</td>
<td>0.941</td>
<td>negligible</td>
</tr>
</tbody>
</table>

**Note:** If the member SELECT facility is used in place of a code CHECK, STAAD.Pro will actually select a 2-L 102x89x6.4 member, which has a critical ratio of 0.997 (per Cl. 13.2) and an area of 2,340 mm\(^2\), thus more economical (the NSF used for this size is 0.923).

END OF DESIGN OUTPUT OF MEMBER 1
V. CSA S16-14 - Beam Bending

Determine the uniformly factored load that the member can resist.

Reference

Example 5.1

Related Links
- D4.E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19 (on page 1440)

Problem
A W310x52 beam spans 7.3 m. Both ends of the beam are supported by columns connected standard web angle connections.

The material used is G40.21 350W steel ($F_y = 350$ MPa) (FYLD)

Calculations
The nominal yield strength is used for the actual yield strength for a Group 2 section, per Table 3 and Table 4 of Appendix A of the reference.

Section Classification
Evaluate the slenderness effects of the beam flanges:

$$\frac{b}{2t} = \frac{167}{2 \times 13.2} = 6.3 < \frac{170}{\sqrt{350}} = 9.1$$

Evaluate the slenderness effects of the beam web:

$$\frac{h}{w} = \frac{318 - 2(13.2)}{7.6} = 38.4 < \frac{1,700}{\sqrt{350}} = 90.9$$

Both the beam flanges and web are less than the local buckling limit, so the capacity of the column is evaluated using Eq. 5.7.

Bending Capacity
Factored moment resistance is:

$$M_r = \phi Z_x F_y = 0.90 \times 841 \times (10)^3 \times 350 = 265 \times (10)^3 \text{ N·mm} = 265 \text{ kN·m}$$

Equate this to the bending moment due to a uniformly distributed load and solve for the load:

$$M_r \geq \frac{w_f L^2}{8}$$

$$w_f = \frac{8M_r}{L^2} = \frac{8 \times 265}{(7.3)^2} = 39.8 \text{ kN/m}$$
Comparison

Table 603: Comparison of results

<table>
<thead>
<tr>
<th>Criteria (kN-m)</th>
<th>Reference</th>
<th>STAAD.Pro</th>
<th>Difference</th>
</tr>
</thead>
<tbody>
<tr>
<td>$M_r$</td>
<td>265</td>
<td>265</td>
<td>none</td>
</tr>
<tr>
<td>$w_f$</td>
<td>39.8</td>
<td>39.76*</td>
<td>negligible</td>
</tr>
</tbody>
</table>

Note: (*) STAAD.Pro does calculate the allowable uniform load on the beam. Instead, this is done by applying a uniform load incrementally until the critical ratio is $\approx 1.0$. The, this uniform load is divided by the resulting critical ratio to normalize the distributed load capacity of the beam. Thus, $39.8/1.001 = 39.67 \text{ kN/m}$

V. CSA S16-14 - Beam Shear Capacity

Reference

Example 5.3

Related Links
- [D4.E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19](on page 1440)

Problem
The W530x82 beam has a maximum shear force, $v = 540$ kN due to factored loads.

$L = 11.0$ m

The material used is G40.21 350W steel ($F_y = 350$ MPa) (FYLD)

Calculations
Evaluate the slenderness effects of the beam web:

$$\frac{h}{w} = \frac{528 - 2(13.3)}{9.5} = 52.8 < 439\sqrt{\frac{F_y}{F_{yi}}} = 439\sqrt{\frac{350}{350}} = 54.2$$

Therefore the shear capacity is calculated as:

$$V_r = \phi \times A_w \times F_y = 0.9 \times 528 \times 9.5 \times 350 = 1,043 \text{ kN}$$

Calculate Equivalent Concentrated Load
The given end moments and assumed distributed loads (which was determined to given an equivalent mid-span moment of the given example) do not result in a shear force of 540 kN. Therefore, an additional concentrated load is added near the first support.

$$R_1 = \frac{w f L}{2} + \frac{M_1 - M_2}{L} = \frac{40.17 \times 11.0}{2} + \frac{540 - 185}{11.0} = 253.2 \text{ kN}$$

$$P = 540 \text{ kN} \cdot 253.2 \text{ kN} = 287 \text{ kN}$$

The STAAD.Pro will have this load applied at 1 mm away from the left support.

V. CSA S16-14 - Select a Beam

Select a wide-flange shape for the given beam span.

Reference

Related Links

- D4.E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19 (on page 1440)

Problem

A beam must be selected to span 11.0 m. The end moment of the span are:

\[ M_1 = -540 \text{ kN}\cdot\text{m} \]
\[ M_2 = -185 \text{ kN}\cdot\text{m} \]

And the maximum moment in the span is:

\[ M_3 = 256 \text{ kN}\cdot\text{m} \]

The beam is braced at 2.5 m from the center of each supporting column (thus \( L_b = 6.0 \text{ m} \)) (LT 6.0).

The material used is G40.21 350W steel (\( F_y = 350 \text{ MPa} \)) (FYLD)

Calculations

Assume a Class 2 section:

\[ M_r = \phi M_p = \phi Z_x F_y \]

Thus,

\[ Z_x \geq \frac{540(10)^6}{0.9 \times 350} = 1,714 \times (10)^3 \text{ mm}^3 \]

Try a W460x82:

\[ Z_x = 1,830 \times (10)^3 \text{ mm}^3, \text{ tf} = 16.0 \text{ mm, bf} = 191.0 \text{ mm, tw} = 9.9 \text{ mm, D} = 460.0 \text{ mm} \]

Evaluate the slenderness effects of the beam flanges:
Evaluate the slenderness effects of the beam web:
\[
\frac{h}{w} = \frac{460 - 2(16.0)}{9.9} = 43.2 < \frac{1.700}{\sqrt{350}} = 90.9
\]

The assumptions are valid and this beam is sufficient to support the given moments.

\[M_r = 0.9 \times 1,830 \times (10)^3 \times 350 \times [(10)^6] = 576.5 \text{ kN·m}\]

Ratio = \(\frac{540}{576.5} = 0.937\)

**Comparison**

**Table 605: Comparison of results**

<td>0.937</td>
<td>none</td>
</tr>
</tbody>
</table>

**Notes:**

*The reference also tries a W530x82, which is stiffer for the same weight. STAAD.Pro selects the shallower beam.

** The reference does not calculate the resisting moment capacity nor the critical ratio for either section size, but they are evaluated here for completeness.

**STAAD Input**

The file C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Canada\CSA S16-14 - Select a Beam.STD is typically installed with the program.

In order to model this beam in STAAD.Pro, we need to determine the distributed load which would result in the same mid-span moment on a beam with the given end moments. From the AISC Steel Construction Manual, p 3-222:

\[
M_3 = \frac{w_f L^2}{8} - \frac{(M_1 + M_2)}{2} + \frac{(M_1 - M_2)^2}{2w_f L^2}
\]

\[
256 = \frac{w_f (11.0)^2}{8} - \frac{(540 + 185)}{2} + \frac{(540 - 185)^2}{2w_f (11.0)^2}
\]

Solving this yields \(w_f = 40.033 \text{ kN/m}\)

V. CSA S16-14 - Shear Capacity Combined Stresses

Reference

Example 8.6

Related Links
• D4.E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19 (on page 1440)

Problem
The W250x73 column has the following concentrated loads
\[ C_f = 900 \text{ kN} \]
And a uniform moment of:
\[ M_{fx} = 180 \text{ kN} \cdot \text{m} \]
The material used is G40.21 350W steel (\( F_y = 350 \text{ MPa} \)) (FYLD). The beam is braced against lateral-torsional buckling only at the ends (LAT θ, default)

Calculations

Axial Capacity

Determine the buckling load of the column:
\[
\left( \frac{KL}{r} \right)_x = \frac{1.0(3,600)}{110} = 32.7
\]
\[
\left( \frac{KL}{r} \right)_y = \frac{1.0(3,600)}{64.6} = 55.7
\]
The largest slenderness ratio controls:
\[
F_{ex} = \frac{n^2E}{\left( \frac{KL}{r} \right)_x^2} = \frac{n^2(200,000)}{(55.7)^2} = 635.6 \text{ kN}
\]
\[
\lambda = \sqrt{\frac{F_{ex}}{F_{ey}}} = \sqrt{\frac{350}{635.6}} = 0.742
\]
\[
C_r = \phi AF_y \left( 1 + \lambda^{2n} \right)^{-1/n} = 0.90 \times 9, 280 \times 350 \left[ 1 + 0.742^{(2 \times 1.34)} \right]^{-1/1.34} = 2, 216 \times (10)^6 \text{ N} = 2, 216 \text{ kN}
\]

Moment Modifier

Uniform moment:
\[ \omega_1 = 1.0 \]
Calculate the elastic buckling load for the bending axis:
\[
C_e = \frac{n^2 \times 200,000 \times 113 \times 10^6}{(1.0 \times 3,600)^2} = 17,211 \text{ kN}
\]
\[ U_{1x} = \frac{1.0}{\frac{900}{17,211}} = 1.06 \]

**Bending Capacity**

\[ \omega_2 = 1.0 \]

\[ EI_y GJ = 200,000 \times 38.8 \times 76.92 \times 575 = 343.2 \times 10^{21} \text{ MPa}^2 \text{ mm}^8 \]

\[ \left( \frac{nE}{L} \right)^2 I_y C_w = \left( \frac{\pi \times 200,000}{3,600} \right)^2 38.8 \times 553 = 653.6 \times 10^{21} \text{ MPa}^2 \cdot \text{ mm}^8 \]

\[ M_u = \frac{\omega_2^2}{L} \sqrt{EI_y GJ + \left( \frac{nE}{L} \right)^2 I_y C_w} \]

\[ = \frac{1.0 \times \pi}{3,600} \sqrt{343.2 \times 10^{21} + 653.6 \times 10^{21}} = 871 \times 10^6 \text{ N mm} = 871 \text{ kN m} \]

Plastic moment capacity:

\[ M_p = Z_x F_y = 985 \times 10^3 \times 350 = 345 \times 10^6 \text{ N mm} = 345 \text{ kN m} \]

\[ M_u = 871 \text{ kN m} > 0.67 \times M_p = 0.67 \times 345 = 231 \text{ kN m} \]

Therefore, the moment capacity is calculated as:

\[ M_r = 1.15 \phi M_p \left( 1 - \frac{0.28 M_p}{M_u} \right) = 1.15 \times 0.9 \times 345 \left( 1 - \frac{0.28 \times 345}{871} \right) = 317 \text{ kN m} \]

Check the capacity based on the strength cross-section:

\[ M_{rx} = 0.9 \times 985 \times 10^3 \times 350 = 310 \text{ kN m} \]

This governs capacity.

**Combined Stress Ratio**

\[ \frac{900}{2,216} + \frac{0.85 \times 1.06 \times 180}{310} = 0.406 + 0.523 = 0.929 < 1.0 \]

### V. CSA S16-14 - Short Column Compression

Determine the factored compressive resistance of a short column.

### Reference

### Related Links

- [D4.E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19](#) (on page 1440)
Problem

A W250x73 section is used for a pedestal with a height of 1.1 m.
The material used is G40.21 350W steel ($F_y = 350$ MPa) (FYLD)

Calculations

The nominal yield strength is used for the actual yield strength for a Group 2 section, per Table 3 and Table 4 of Appendix A of the reference.

Local Element Buckling

Evaluate the slenderness effects of the column web:

$$\frac{h}{w} = \frac{225}{8.6} = 26.2 < \frac{670}{\sqrt{350}} = 35.8$$

Evaluate the slenderness effects of the column flanges:

$$\frac{b}{2t} = \frac{254}{2 \times 14.2} = 8.9 < \frac{200}{\sqrt{350}} = 10.7$$

Both the column web and flanges are less than the local buckling limit, so the capacity of the column is evaluated using Eq. 4.21.

Column Capacity

Assume $K = 1.0$,

$$\frac{L}{r_x} = \frac{1.100}{110} = 10$$
$$\frac{L}{r_y} = \frac{1.100}{64.8} = 17$$

The largest slenderness ratio controls, thus the slenderness factor for buckling about the minor axis:

$$\lambda = \left(\frac{KL}{r}\right)_{\text{max}} \sqrt{\frac{F_y}{2E}} = 17\sqrt{\frac{350}{2 \times 200,000}} = 0.227$$

When $n = 1.34$ (Group 2 W shape),

$$C_r = \phi AF_y \left(1 + \lambda^{2n}\right)^{-1/n} = 0.90 \times 9, 280 \times 350 \left[1 + 0.227^{(2 \times 1.34)}\right]^{-1/1.34} = 2.883 \times (10)^6 \text{ N} = 2, 883 \text{ kN}$$

V. CSA S16-14 - Slender Column Compression

Determine the factored compressive resistance of a slender column.

Reference

Example 4.2

Related Links
- *D4.E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19* (on page 1440)

Problem
A W250x73 section is used for a pedestal with a height of 11.0 m.
The material used is G40.21 350W steel \(F_y = 350\) MPa (FYLD)

Calculations
The nominal yield strength is used for the actual yield strength for a Group 2 section, per Table 3 and Table 4 of Appendix A of the reference.

Local Element Buckling
Evaluate the slenderness effects of the column web:
\[
\frac{h}{w} = \frac{225}{8.6} = 26.2 < \frac{670}{\sqrt{350}} = 35.8
\]
Evaluate the slenderness effects of the column flanges:
\[
\frac{b}{2t} = \frac{254}{2 \times 14.2} = 8.9 < \frac{200}{\sqrt{350}} = 10.7
\]
Both the column web and flanges are less than the local buckling limit, so the capacity of the column is evaluated using Eq. 4.21.

Column Capacity
Assume \(K = 1.0\),
\[
\frac{L}{r_x} = \frac{11,000}{110} = 100
\]
\[
\frac{L}{r_y} = \frac{11,000}{64.6} = 170
\]
The largest slenderness ratio controls, thus the slenderness factor for buckling about the minor axis:
\[
F_e = \frac{\pi^2 \times 200,000}{(1.0 \times 170)^2} = 68.3 \text{ kN}
\]
\[
\lambda = \sqrt[1/n]{\frac{F_y}{F_e}} = \sqrt[1/n]{\frac{350}{68.3}} = 2.26
\]

When \( n = 1.34 \) (Group 2 W shape),

\[
C_r = \phi AF_y \left(1 + \lambda^{2n}\right)^{-1/n} = 0.90 \times 9, 280 \times 350 \left[1 + 2.26^{(2\times1.34)}\right]^{-1/1.34} = 0.529 \times (10)^6 \text{ N} = 529 \text{ kN}
\]

V. CSA S16-14 - Wide Flange Capacity Combined Stresses

Check the capacity of a wide-flange column under combined stresses.

Reference

Related Links

- D4.E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19 (on page 1440)

Problem

The W250x73 column has the following concentrated loads applied at the top of the column:

\[ C_f = 900 \text{ kN} \]
\[ M_{fx} = 180 \text{ kN m} \]

The material used is G40.21 350W steel \( F_y = 350 \text{ MPa} \) (FYLD). The column is assumed to be braced laterally against lateral-torsional buckling (LAT 1).

\[ L = 3.6 \text{ m} \]

Calculations

Local Element Buckling

Evaluate the slenderness effects of the column web:
Evaluate the slenderness effects of the column flanges:

\[
\frac{b}{2t} = \frac{254}{2 \times 14.2} = 8.9 < \frac{200}{350} = 10.7
\]

Both the column web and flanges are less than the local buckling limit, so the capacity of the column is evaluated using Eq. 4.21.

**Axial Capacity**

Determine the buckling load of the column, assuming that weak axis bucking will not control due to bracing:

\[
\left( \frac{KL}{r} \right)_x = \frac{1.0(63, 600)}{110} = 32.7
\]

The largest slenderness ratio controls:

\[
F_{ex} = \frac{n_2 E}{(KL)^2} = \frac{n_2 (200, 000)}{(32.7)^2} = 1,847 \text{ kN}
\]

\[
\lambda = \sqrt{\frac{F_y}{F_{ex}}} = \sqrt{\frac{350}{1,847}} = 0.435
\]

\[
C_r = \phi A F_y \left( 1 + \lambda^{2n} \right)^{-1/n} = 0.90 \times 9, 280 \times 350 \left[ 1 + 0.435^{(2 \times 1.34)} \right]^{-1/1.34} = 2, 716 \times (10)^6 \text{ N} = 2, 716 \text{ kN}
\]

**Moment Modifier**

\[
\kappa = -0/180 = 0
\]

\[
\omega_1 = 0.6 - 0.4\kappa = 0.6 \leq 1.0
\]

Calculate the elastic buckling load for the bending axis:

\[
C_e = \frac{n_2 \times 200, 000 \times 113 \times 10^6}{(1.0 \times 3, 600)^2} = 17, 211 \text{ kN}
\]

\[
U_{1x} = \frac{0.6}{1 - \left( \frac{900}{17, 210} \right)} = 0.633
\]

**Bending Capacity**

From a previous example, the W250x73 is a Class 2 section. It is laterally supported along its length, thus:

\[
M_{rx} = 0.9 \times 985 \times 10^3 \times 350 = 310 \text{ kN} \cdot \text{m}
\]

**Combined Stress Ratio**

\[
\frac{900}{2, 716} + \frac{0.85 \times 0.633 \times 180}{310} = 0.331 + 0.312 = 0.644 < 1.0
\]

This is the check for overall member strength. However, there is another case that actually controls in this instance: checking for cross sectional strength.

\[
C_r = 0.9 \times 9, 280 \times 350 = 2, 923 \text{ kN}
\]
\[ U_{1x} = 1.0 \]
\[
= \frac{900}{2.925} + \frac{0.85 \times 1.0 \times 180}{310} = 0.308 + 0.494 = 0.801 < 1.0
\]

**Comparison**

V. CSA S16-19 - Axial Tension

Determine the capacity of a member subject to axial tension load per the CSA S16-19 code.

Problem

A 4 m long member is subjected to a 630 kN tensile load. The section is a Canadian W100x19. The steel is grade 300W.

Section Properties

\[ A_g = 2,480 \text{ mm}^2 \]

Material Properties

\[ F_y = 300 \text{ MPa} \]
\[ F_u = 450 \text{ MPa} \]

Calculations

Assume the gross area for both yielding and rupture limit states. Therefore, \( A_{ne} = A_g = 2,480 \text{ mm}^2 \).

\[ T_r = \min \left( \phi_{A_g} F_y, \phi_{A_{ne}} F_u \right) \]
\[ = 0.9 \times 300 \times 2,480 \times 10^{-3} = 669.6 \text{ kN} \]
\[ = 0.75 \times 450 \times 2,480 \times 10^{-3} = 837 \text{ kN} \]

So, the tensile capacity = 669.6 kN.

The critical stress ratio \( 630 / 669.6 = 0.941 \).
## Comparison

### STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\V09 Steel Design\Canada\CSA S16-19 - Axial Tension.STD` is typically installed with the program.

The following [D4.E.7 Design Parameters](#) (on page 1451) are used:

- The parameter SNUG 0 is used for welded or pre-tensioned bolts (i.e., no reduction for bolt holes)
- The default value of NSF 1 is used for net section equal to the gross area.
- The default value of SLF 1 is used for a shear lag factor of 1 (i.e., no shear lag in connection)

## V. CSA S16-19 - Axial Tension and Bending Interaction

Determine the capacity of a member subject to axial tension and biaxial moment per the CSA S16-19 code.

### Problem

A 3.6 m long column is subjected to a 900 kN tensile load along with concentrated moments of 50 kN·m about both major and minor axes at one end. The section is a Canadian W250x73. The steel is grade 350W.

Section Properties

D = 253 mm
B = 254 mm
t_w = 8.6 mm
t_f = 14.2 mm
A_g = 9,280 mm²
Z_x = 985,000 mm³
Z_y = 463,000 mm³

Material Properties

F_y = 350 MPa
F_u = 450 MPa

Calculations

Section Classification

Compression section classification per Table 1:

b_el = B / 2 = 127 mm

h = D - 2×t_f = 235.8 mm

- Flange classification:

\[ \frac{b_{el}}{t} = \frac{127}{14.2} = 8.94 < \frac{200}{\sqrt{F_y}} = \frac{200}{\sqrt{350}} = 10.69 \]

- Web classification:

\[ \frac{h}{w} = \frac{235.8}{8.6} = 27.42 < \frac{670}{\sqrt{F_y}} = \frac{670}{\sqrt{350}} = 35.81 \]

Therefore, the section is Class 1 for compression.

Flexure section classification per Table 2:

- Flange classification about major axis:

\[ \frac{145}{\sqrt{F_y}} = 7.75 < \frac{b_{el}}{t} = \frac{127}{14.2} = 8.94 < \frac{170}{\sqrt{350}} = 9.09 \]

Class 2

- Flange classification about minor axis:

\[ \frac{145}{\sqrt{F_y}} = 7.75 < \frac{b_{el}}{t} = \frac{127}{14.2} = 8.94 < \frac{170}{\sqrt{350}} = 9.09 \]

Class 2

- Web classification about major axis:

\[ \frac{h}{w} = \frac{235.8}{8.6} = 27.42 < \frac{1100}{\sqrt{F_y}} = 58.8 \]

Class 1

- Web classification about minor axis:
\[ h/w = \frac{235.8}{8.6} = 27.42 < \frac{1.100}{\sqrt{F_y}} = 58.8 \]

Class 1

Therefore, the section is Class 2 for flexure.

**Axial Tension**

Assume the gross area for both yielding and rupture limit states. Therefore, \( A_{ne} = A_g = 9,280 \text{ mm}^2 \).

\[
T_r = \min \left\{ \frac{\phi A_g F_y}{\phi u A_{ne} F_u} \right\} = 0.9 \times 350 \times 9,280 (10^{-3}) = 2,923 \text{ kN}
\]

\[
\frac{\phi u A_{ne} F_u}{\phi u A_{ne} F_u} = 0.75 \times 450 \times 9,280 (10^{-3}) = 3,132 \text{ kN}
\]

So, the tensile capacity = 2,923 kN.

The critical stress ratio \( 900 / 2,923 = 0.308 \).

**Bending Capacity**

For a Class 2, doubly symmetric section, the capacity is determined by Cl. 13.5a:

Major axis:

\[
M_{px} = Z_x F_y = 985,000 \times 350 (10^6) = 344.8 \text{ kN m}
\]

\[
M_{rx} = 0.9 \times 344.8 = 310.3 \text{ kN m}
\]

The ratio = \( 50 / 310.3 = 0.161 \)

Minor axis:

\[
M_{py} = Z_y F_y = 463,000 \times 350 (10^6) = 162.1 \text{ kN m}
\]

\[
M_{ry} = 0.9 \times 162.1 = 145.8 \text{ kN m}
\]

The ratio = \( 50 / 145.8 = 0.343 \)

**Combined Axial Tension and Bending**

Check for axial tension and bending per Cl. 13.9.2:

\[
\frac{T_f}{T_r} + 0.85 \frac{M_{fx}}{M_{rx}} + 0.6 \frac{M_{fy}}{M_{ry}} = 0.380 + 0.85 \left( 0.161 \right) + 0.6 \left( 0.343 \right) = 0.651 < 1.0
\]

Also, the following must be satisfied:

\[
\frac{M_{fx}}{M_{rx}} + \frac{M_{fy}}{M_{ry}} = 0.161 + 0.343 = 0.504 < 1.0
\]

### STAAD Input

The file C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Canada\CSA S16-19 - Axial Tension and Bending Interaction.STD is typically installed with the program.

The following D4.E.7 Design Parameters (on page 1451) are used:

- The default value of NSF 1 is used for net section equal to the gross area.
- The default value of SLF 1 is used for a shear lag factor of 1 (i.e., no shear lag in connection)

V. CSA S16-19 - Cantilever Beam with Point Load

Determine the capacity of a cantilever beam subject to a point load per the CSA S16-19 code.

Details

A 7.5 m long cantilever member is subjected to load at the free end of 5 kN. The section is a Canadian W310x52. The steel is grade 350W. The section is unbraced along the length.

Section Properties

D = 318 mm
B = 167 mm  
\[ t_w = 7.6 \text{ mm} \]  
\[ t_f = 13.2 \text{ mm} \]  
\[ A_g = 9,280 \text{ mm}^2 \]  
\[ Z_x = 841,000 \text{ mm}^3 \]  
\[ Z_y = 189,000 \text{ mm}^3 \]  
\[ I_y = 1,030,000 \text{ mm}^4 \]  
\[ J = 308,000 \text{ mm}^4 \]  
\[ C_w = 238 \times 10^9 \text{ mm}^6 \]

**Material Properties**

\[ F_y = 350 \text{ MPa} \]  
\[ F_u = 450 \text{ MPa} \]

**Validation**

**Section Classification**

\[ b_{el} = \frac{B}{2} = 83.5 \text{ mm} \]  
\[ h = D - 2 \times t_f = 291.6 \text{ mm} \]  
\[ C_f = 0 \text{ (no compression force)} \]

Flexure section classification per Table 2 of CSA S16-19:

- **Flange classification about major axis:**
  \[ \frac{b_{el}}{t_f} = \frac{83.5}{13.2} = 6.33 < \frac{145}{\sqrt{F_y}} = \frac{145}{\sqrt{350}} = 7.75 \]
  Class 1

- **Flange classification about minor axis:**
  \[ \frac{b_{el}}{t_f} = \frac{83.5}{13.2} = 6.33 < \frac{145}{\sqrt{F_y}} = \frac{145}{\sqrt{350}} = 7.75 \]
  Class 1

- **Web classification about major axis:**
  \[ \frac{h}{t_w} = \frac{291.6}{7.6} = 38.67 < \frac{1.100}{\sqrt{F_y}} \left( 1 - 0.39 \frac{C_f}{\varphi C_y} \right) = 58.8 \]
  Class 1

- **Web classification about minor axis:**
  \[ \frac{h}{t_w} = \frac{291.6}{7.6} = 38.67 < \frac{1.100}{\sqrt{F_y}} \left( 1 - 0.39 \frac{C_f}{\varphi C_y} \right) = 58.8 \]
  Class 1

Therefore, the section is Class 1 for flexure.

**Bending Capacity**

\[ M_{fx} = 5 \times 7.5 = 37.5 \text{ kN m} \]
For a Class 1, doubly symmetric section, the capacity is determined by Cl. 13.5:

Major axis:

\[ M_{px} = Z_x \times F_y = 841,000 \times 350 \times (10)^6 = 294.4 \text{ kN} \cdot \text{m} \]

\[ M_{rx} = \phi M_{px} = 0.9 \times 294.4 = 264.9 \text{ kN} \cdot \text{m} \]

The ratio \( \frac{37.5}{264.9} = 0.142 \)

Minor axis:

\[ M_{py} = Z_y \times F_y = 189,000 \times 350 \times (10)^6 = 66.2 \text{ kN} \cdot \text{m} \]

\[ M_{ry} = \phi M_{py} = 0.9 \times 66.2 = 59.5 \text{ kN} \cdot \text{m} \]

Check for lateral-torsional buckling per Cl. 13.6.h i).

\[ M_u = \omega_2 C_H C_B \frac{\sqrt{ET_yGJ}}{L_c} \]

where

\[ X = \frac{n}{L_c} \sqrt{\frac{E\sigma_w}{GJ}} = \frac{n}{7500} \sqrt{\frac{205,000 \times 238(10)^6}{76,920 \times 308,000}} = 0.601 \]

\[ 0.5 \leq X \leq 2.3 \text{ for a point load} \]

\[ \omega_2 = 3.95 + 3.52 X = 3.95 + 3.52 (0.601) = 6.07 \]

\[ C_H = 0.76 - 0.51 X + 0.13 X^2 = 0.76 - 0.51 (0.601) + 0.13 (0.601)^2 = 0.50 \]

\[ C_B = 1.0 \]

\[ M_u = 6.07(0.50)(1.0)\sqrt{\frac{205,000 \times 1,030,000 \times 76,920 \times 308,000}{7,500 \times (10)^6}} = 90.5 \text{ kN} \cdot \text{m} \]

\[ 0.67 \times M_{px} = 0.67 (294.4) = 197.2 \text{ kN} \cdot \text{m} > M_u \]

\[ M_r = \phi M_u = 0.9 \times 90.52 = 81.5 \text{ kN} \cdot \text{m} \]

The ratio \( \frac{37.5}{81.5} = 0.46 \)

### V. CSA S16-19 - Check for Bending and LTB

Determine the capacity of a laterally unbraced beam subject to bending moment per the CSA S16-19 code.

**Problem**

A 7.5 m long, simply supported beam is subjected to a distributed load of 12 kN/m. The section is a Canadian W310x52. The steel is grade 350W.

**Section Properties**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>$D$</td>
<td>318 mm</td>
</tr>
<tr>
<td>$B$</td>
<td>167 mm</td>

<tr>
<td>$t_w$</td>
<td>7.6 mm</td>
</tr>
<tr>
<td>$t_f$</td>
<td>13.2 mm</td>
</tr>
<tr>
<td>$Z_x$</td>
<td>841,000 mm$^3$</td>
</tr>
<tr>
<td>$Z_y$</td>
<td>189,000 mm$^3$</td>
</tr>
<tr>
<td>$I_y$</td>
<td>$10.3 \times 10^6$ mm$^4$</td>
</tr>
</tbody>
</table>
Material Properties

\( F_y = 350 \text{ MPa} \)
\( F_u = 450 \text{ MPa} \)
\( E = 205,000 \text{ MPa} \)
\( G = 76,920 \text{ MPa} \)

Calculations

Section Classification

\[ b_{el} = B / 2 = 83.5 \text{ mm} \]
\[ h = D - 2\times t_f = 291.6 \text{ mm} \]

Flexure section classification per Table 2:

- Flange classification about major axis:
  \[ \frac{b_{el}}{t} = \frac{83.5}{13.2} = 6.33 < \frac{145}{\sqrt{F_y}} = 7.75 \]
  Class 1

- Flange classification about minor axis:
  \[ \frac{b_{el}}{t} = \frac{83.5}{13.2} = 6.33 < \frac{145}{\sqrt{F_y}} = 7.75 \]
  Class 1

- Web classification about major axis:
  \[ \frac{h}{w} = \frac{291.6}{7.6} = 38.37 < \frac{1.100}{\sqrt{F_y}} = 58.8 \]
  Class 1

- Web classification about minor axis:
  \[ \frac{h}{w} = \frac{291.6}{7.6} = 38.37 < \frac{1.100}{\sqrt{F_y}} = 58.8 \]
  Class 1

Therefore, the section is Class 1 for flexure.

Bending Capacity

\[ M_{fx} = \frac{12(7.5)^2}{8} = 84.4 \text{ kN} \cdot \text{m} \]

For a Class 2, doubly symmetric section, the capacity is determined by Cl. 13.5a:

Major axis:

\[ M_{px} = Z_x \times F_y = 841,000 \times 350 \times 10^6 = 294.4 \text{ kN} \cdot \text{m} \]
\[ M_{rx} = \phi M_{px} = 0.9 \times 294.4 = 264.9 \text{ kN} \cdot \text{m} \]
The ratio = 84.4 / 264.9 = 0.318

Minor axis:

\[
M_{py} = Z_y \times F_y = 189,000 \times 350 \times 10^{-6} = 66.2 \text{ kN m}
\]

\[
M_{rx} = \phi M_{px} = 0.9 \times 66.2 = 59.5 \text{ kN m}
\]

**Lateral Torsional Buckling**

Check for lateral torsional buckling per Cl. 13.6:

\[
M_u = \frac{\omega^2}{L} \sqrt{EI_y GJ + \left(\frac{\pi E}{L}ight)^2 I_y C_w} < 0.67 \times M_p
\]

where

\[
\begin{align*}
\omega^2 &= 1.0 \\
EI_y GJ &= 205,000 \times 10.3 \times 76,920 \times 308,000 = 50.02 \times 10^{21} \\
\left(\frac{\pi E}{L}\right)^2 I_y C_w &= \left(\frac{n \times 205,000}{7,500} \right)^2 \times 10.3 \times 10^{21} \\
109.3 < 0.67 (294.4) &= 197.2 \\
M_r = \phi M_u &= 0.9 \times 109.3 = 98.38 \text{ kN m}
\end{align*}
\]

Ratio = 84.4 / 98.38 = 0.858

**V. CSA S16-19 - CLASS4 UPT Cantilever Beam with UDL**

Determine the capacity of a cantilever beam using a user-provided section subject to a distributed load per the CSA S16-19 code.
Details
A 7.5 m long cantilever member is subjected to uniformly distributed load of 1 kN. The section is an I shape with 300 mm × 15 mm flanges and a 420 mm × 15 mm web. The compression flange is laterally unbraced along the length.

Material Properties

\[ F_y = 650 \text{ MPa} \]

Validation

Section Properties

\[
D = 420 + 15 + 15 = 450 \text{ mm}
\]

\[
A_g = 2 \times (300 \times 15) + 420 \times 15 = 15,300 \text{ mm}^2
\]

\[
\begin{align*}
I_x &= 2 \left[ \frac{300(15)^3}{12} + 300 \times 15 \left( \frac{420 + 15}{2} \right)^2 \right] + \frac{15(420)^3}{12} = 518.5(10)^6 \text{ mm}^4 \\
I_y &= 2 \left[ \frac{420(15)^3}{12} \right] + \frac{420(15)^3}{12} = 67,620,000 \text{ mm}^4 \\
S_x &= \frac{518.5(10)^6}{450} = 2,305,000 \text{ mm}^3 \\
S_y &= \frac{67,620,000(2)}{300} = 450,800 \text{ mm}^3 \\
J &= \frac{1}{3} \left[ 2 \times 300(15)^3 + 420(15)^3 \right] = 1,148,000 \text{ mm}^4 \\
C_w &= \frac{(420 + 15)^2(300)^3 \times 15}{24} = 3,193(10)^9 \text{ mm}^6
\end{align*}
\]

Section Classification

\[ b_{el} = B / 2 = 150 \text{ mm} \]

\[ C_f = 0 \text{ (no compression force)} \]

Flexure section classification per Table 2 of CSA S16-19:

- Flange classification about major axis:

\[
\frac{b_{el}}{t_f} = \frac{150}{15} = 10 > \frac{200}{\sqrt{F_y}} = \frac{200}{\sqrt{650}} = 7.84
\]

Class 4

- Flange classification about minor axis:

\[
\frac{b_{el}}{t_f} = \frac{150}{15} = 10 < \frac{340}{\sqrt{F_y}} = \frac{340}{\sqrt{650}} = 13.36
\]

Class 3

- Web classification about major axis:

\[
\frac{h}{t_w} = \frac{420}{15} = 28 < \frac{1.100}{\sqrt{F_y}} \left( 1 - 0.39 \frac{C_f}{C_y} \right) = 58.8
\]

Class 1

- Web classification about minor axis:
\[
\frac{h}{t_w} = \frac{420}{15} = 28 < \frac{1.100}{\sqrt{F_y}} \left(1 \cdot 0.39 \frac{C_f}{\varphi C_y}\right) = 58.8
\]

Class 1
Therefore, the section is Class 4 for flexure.

**Bending Capacity**

\[
M_{fx} = \frac{1.0(7.5)^2}{2} = 28.1 \text{ kN m}
\]

For a Class 4, doubly symmetric section, the capacity is determined by Cl. 13.5.c. In this case, the compression flange is Class 4 but the web is Class 3, so Cl. 13.5.c.iii applies. Therefore, the effective section modulus, \(S_e\), is used. The outstanding element length is limited to:

\[
b_{el} = \frac{200 t}{\sqrt{F_y}} = \frac{200 \times 15}{\sqrt{650}} = 118 \text{ mm}
\]

Therefore, \(b_{eff} = 2 \times b_{el} = 236 \text{ mm}\)

\[
I_{eff,x} = 2 \left[ \frac{268(15)^3}{12} + 268 \times 15 \left(\frac{420 + 15}{2}\right)^2 \right] + \frac{15(420)^3}{12} = 427.7(10)^6 \text{ mm}^4
\]

\[
S_{eff,x} = \frac{427.7(10)^6}{450} = 1,901,000 \text{ mm}^3
\]

Major axis:

\[
M_{yx} = S_{eff,x} \times F_y = 1,901,000 \times 650 (10)^{-6} = 1,236 \text{ kN m}
\]

\[
M_{rx} = \varphi M_{yx} = 0.9 \times 1,236 = 1,112 \text{ kN m}
\]

The ratio = \(28.1 / 1,112 = 0.025\)

Minor axis:

\[
M_{yy} = S_y \times F_y = 450,800 \times 650 (10)^{-6} = 293.0 \text{ kN m}
\]

\[
M_{ry} = \varphi M_{yy} = 0.9 \times 293.0 = 263.7 \text{ kN m}
\]

Check for lateral-torsional buckling per Cl. 13.6.h i).

\[
M_u = \omega_2 C_H C_B \sqrt{\frac{E I_y J_G}{L_c}}
\]

where
\[ X = \frac{n}{L_c} \sqrt{\frac{E I_w}{G l}} = \frac{n}{7,500} \sqrt{\frac{205,000 \times 3,193(10)^5}{76,920 \times 1,148,000}} = 1.142 \]

0.5 \leq X \leq 2.5 for a distributed load

\[ \omega_2 = 5.38 + 8.71 X = 5.38 + 8.71 (1.142) = 15.77 \]

\[ C_H = 0.49 - 0.27 X + 0.06 X^2 = 0.49 - 0.27 (1.142) + 0.06 (1.142)^2 = 0.26 \]

\[ C_B = 1.48 + 0.16 X = .48 + 0.16 (1.142) = 1.66 \]

\[ M_u = 15.77(0.26)(1.66)\sqrt{\frac{205,000 \times 67,620,000 \times 76,920 \times 1,148,000}{7,500 \times (10)^6}} = 1,004 \text{ kN·m} \]

\[ 0.67 \times M_y = 0.67 (1,236) = 827.8 \text{ kN·m} < M_u \]

\[ M_x = 1.15 \times M_y [1 - 0.28 M_y / M_u] = 1.15 \times 0.9 \times 1,236 [1 - 0.28 \times (1,236 / 1,004)] = 838.3 \text{ kN·m} \]

The ratio = \( \frac{28.1}{838.3} = 0.034 \)

### STAAD.Pro Input

The file C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Canada\CSA S16-19 - CLASS4 UPT Cantilever Beam with UDL.STD is typically installed with the program.

The following **D4.E.7 Design Parameters** (on page 1451) are used:

- The cantilever is braced along the tension flange only specified using CAN 2.
- The load acts on the tension side of the bending member, thus LHT 1.

Verification Examples

V. CSA S16-19 - Short Column Compression

Determine the capacity of a short column per the CSA S16-19 code.

Problem

A Canadian W250x73 section is used for a pedestal with a height of 1.1 m. The axial load is 1,000 kN in compression. The steel is grade 350W.

Section Properties

\[
\begin{align*}
D &= 253 \text{ mm} \\
B &= 254 \text{ mm} \\
t_w &= 8.6 \text{ mm} \\
t_f &= 14.2 \text{ mm} \\
A_g &= 9,280 \text{ mm}^2 \\
I_x &= 113 \times 10^6 \text{ mm}^4 \\
I_y &= 38.8 \times 10^6 \text{ mm}^4 \\
J &= 575,000 \text{ mm}^4 \\
C_w &= 553 \times 10^9 \text{ mm}^6
\end{align*}
\]

Material Properties

\[
\begin{align*}
F_y &= 350 \text{ MPa} \\
F_u &= 450 \text{ MPa} \\
E &= 205,000 \text{ MPa}
\end{align*}
\]
G = 76,920 MPa

Calculations

Section Classification

- Flange classification:
  \[ \frac{b_{fl}}{t} = \frac{127}{14.2} = 8.94 < \frac{200}{\sqrt{F_y}} = 10.69 \]

- Web classification about major axis:
  \[ \frac{h}{w} = \frac{235.8}{8.6} = 27.4 < \frac{670}{\sqrt{F_y}} = 35.8 \]

Therefore, the section is Class 1 for compression.

Column Capacity

Assume \( K = 1.0 \),

\[ \frac{KL}{r_x} = \frac{1.0 \times 1,100}{110.3} = 9.97 \]
\[ \frac{KL}{r_y} = \frac{1.0 \times 1,100}{64.7} = 17.0 \]

Elastic buckling stress:

\[ F_{ex} = \frac{n^2 E}{(KL/r_x)^2} = \frac{n^2 \times 205,000}{(9.97)^2} = 20,360 \text{ MPa} \]
\[ F_{ey} = \frac{n^2 E}{(KL/r_y)^2} = \frac{n^2 \times 205,000}{(17.0)^2} = 6,991 \text{ MPa} \]

\[ \lambda_x = \frac{F_{ey}}{F_{ex}} = \sqrt{\frac{350}{20,360}} = 0.131 \]
\[ \lambda_y = \frac{F_{ey}}{F_{ex}} = \sqrt{\frac{350}{6,991}} = 0.224 \]

Per Cl. 13.3.1, \( n = 1.34 \) (Group 2 W shape):

\[ C_{rx} = \phi A F_y \left( 1 + \lambda_x \right)^{2n-1/n} = 0.90 \times 9,280 \times 350 \left[ 1 + 0.131(2 \times 1.34) \right]^{-1/1.34}(10)^3 = 2,914 \text{ kN} \]
\[ C_{ry} = \phi A F_y (1 + \lambda y 2n)^{-1/n} = 0.90 \times 9,280 \times 350 [1 + 0.224 (2 \times 1.34)]^{-1/1.34} (10)^{-3} = 2,884 \text{ kN} \]

**Flexural Torsional Buckling**

\[ r_o^2 = r_x^2 + r_y^2 + X^2 + Y^2 = (110.3)^2 + (64.7)^2 + 0 + 0 = 16,360 \text{ mm}^2 \]

\[ F_{ez} = \left[ \frac{n^2 E C_w}{(K_z L_z)^2} + GJ \right] \frac{1}{A \times r_o^2} \]

\[ = \left[ \frac{n^2 \times 205,000 \times 553 (10)^9}{(1,100)^2} + 76,920 \times 575,000 \right] \frac{1}{9,280 \times 16,360} = 6,382 \text{ MPa} \]

Take the minimum of \( F_{ex}, F_{ey}, \text{ and } F_{ez} \) as \( F_{FTB} \):

\[ F_{FTB} = F_{ez} = 6,382 \text{ MPa} \]

\[ \lambda_{FTB} = \sqrt{\frac{F_{FTB}}{F_e}} = \sqrt{\frac{350}{6,382}} = 0.234 \]

\[ C_{r,FTB} = \phi A F_y (1 + \lambda_y 2n)^{-1/n} = 0.90 \times 9,280 \times 350 [1 + 0.234 (2 \times 1.34)]^{-1/1.34} (10)^{-3} = 2,879 \text{ kN} \]

**Ratio** = \( 1,000 / 2,879 = 0.347 \)

**Comparison**

### V. China

#### V. GB500017-2017 Double Angle section with Axial Force

Verify the slenderness, strength, and stability of a double-angle section subject to axial force per GB500017-2017.

**Reference**

**Problem**

The section is a 2 × L100×100×7 SP 0 with a length of 3.005 m. The structure is a truss model. Member #32 assigned with double angle section (2 × L100×100×7 SP 0) is designed per GB 50017-2017. The governing load combination (#4) is 1.2 DL + 1.4 LL and the ultimate force on the member, \( N \), is 416.2 kN of axial compression.

**Material Properties**

The material is Q235 type steel.

- Design strength in tension, compression, and flexure: \( f_y = 215 \text{ MPa} \)
- Design strength in shear: \( f_v = 125 \text{ MPa} \)

**Section Properties**

- Side length, \( b = h = 100 \text{ mm} \)
Calculations

Slenderness Ratio

According to Table 7.4.1-1 of GB50017-2017, effective length of double angle is:

\[ \ell_{ox} = \ell_x = 3,005 \text{ mm} \]
\[ \ell_{oy} = \ell_y = 3,005 \text{ mm} \]

According to formula 7.2.1-1 and 2 of steel structures code, slenderness ratio of double angle with X axis and Y axis is:

\[ \lambda_x = \frac{\ell_{ox}}{i_x} = \frac{3,005}{30.87} = 97.33 \]
\[ \lambda_y = \frac{\ell_{oy}}{i_y} = \frac{3,005}{41.41} = 72.57 \]

According to formula 7.2.2-7 of steel structures code, torsional buckling equivalent slenderness ratio of double angle is:

\[ \lambda_z = 3.9 \times \frac{b}{t} = 3.9 \times \frac{100}{7} = 55.71 \]

Calculate the equivalent slenderness ratio of symmetry axis. Since \( \lambda_y > \lambda_z \), the formula 7.2.2-5 should be used to get the \( \lambda_{yz} \):

\[ \lambda_{yz} = \lambda_y \left[ 1 + 0.16 \left( \frac{\lambda_z}{\lambda_y} \right)^2 \right] = 72.57 \times \left[ 1 + 0.16 \times \left( \frac{55.71}{72.57} \right)^2 \right] = 79.42 \]

The maximum slenderness ratio of the double-angle section, \( \lambda_{max} = 97.33 \)

The limit of slenderness ratio of compression member is 150 according to table 7.4.6 of steel structures code.

\[ \frac{\lambda_{max}}{\lambda_{limit}} = \frac{97.33}{150} = 0.65 < 1.0, \text{ Passed} \]

The limit of slenderness ratio of tension member is 300 according to table 7.4.7 of steel structures code.

\[ \frac{\lambda_{max}}{\lambda_{limit}} = \frac{97.33}{300} = 0.32 < 1.0, \text{ Passed} \]

Tension or Compression Strength

According to formula 7.1.1-1 and 7.1.1-2 of steel structures code, the stress of double angle with gross cross-section area is:
\[ \sigma = \frac{N}{A} = \frac{416.2 \text{kN}}{2,760 \text{mm}^2} = 150.8 \text{kN/mm}^2 < f = 215 \]

And the ratio is:
\[ \frac{\sigma}{f} = \frac{150.8}{215} = 0.70 \]

The stress of double angle with net cross section area is:
\[ \sigma = \frac{N}{A} = \frac{416.2 \text{kN}}{2,760 \text{mm}^2} = 150.8 \text{kN/mm}^2 < 0.7f_u = 0.7 \times 370 = 259 \]

And the ratio is:
\[ \frac{\sigma}{0.7f_u} = \frac{150.8}{259} = 0.58 \]

**Steel Grade Correction Factor**

The steel type is Q235. According to note 1 in table 3.5.1 of *Standard for design of steel structures* and table 1 of *Standard for design of steel structures. Commentary 2.2*, the steel grade correction coefficient is \( \epsilon_k = 1 \).

**Compressive Strength**

According to table 7.2.1-1 of steel structures code, the double angle section class is b.

The slenderness ratio of double angle on X axis, \( \lambda_x = 97.33 \). So,
\[ \frac{\lambda}{\lambda_k} = \lambda_x = 97.33 \]
\[ \lambda_n = \frac{\lambda_x}{\pi \sqrt{f/\frac{E}{7}}} = \frac{97.33}{\pi \sqrt{235/206,000}} = 1.046 \]

Class b, so, the coefficients are \( a1 = 0.650 \), \( a2 = 0.965 \), and \( a3 = 0.300 \).

Since \( \lambda_n = 1.046 > 0.215 \), then the stability factor in x:
\[ \phi_x = \frac{1}{2 \lambda_n^2} \left[ (a_2 + a_3 \lambda_n + \lambda_n^2) \cdot \sqrt{(a_2 + a_3 \lambda_n + \lambda_n^2)^2 - 4 \lambda_n^2} \right] \]
\[ = \frac{1}{2 \times 1.046^2} \left[ (0.965 + 0.300 \times 1.046 + 1.046^2) \cdot \sqrt{(0.965 + 0.300 \times 1.046 + 1.046^2)^2 - 4 \times 1.046^2} \right] = 0.572 \]

The slenderness ratio of double angle on symmetry axis is \( \lambda_{yz} = 79.42 \). So,
\[ \frac{\lambda}{\lambda_k} = \lambda_x = 79.42 \]
\[ \lambda_n = \frac{\lambda_{xy}}{\pi \sqrt{f/\frac{E}{7}}} = \frac{79.42}{\pi \sqrt{235/206,000}} = 0.854 \]

Class b, so, the coefficients are \( a1 = 0.650 \), \( a2 = 0.965 \), and \( a3 = 0.300 \).

Since \( \lambda_n = 1.046 > 0.215 \), then the stability factor in xy:
\[ \phi_{yz} = \frac{1}{2 \lambda_n^2} \left[ (a_2 + a_3 \lambda_n + \lambda_n^2) \cdot \sqrt{(a_2 + a_3 \lambda_n + \lambda_n^2)^2 - 4 \lambda_n^2} \right] \]
\[ = \frac{1}{2 \times 0.854^2} \left[ (0.965 + 0.300 \times 0.854 + 0.854^2) \cdot \sqrt{(0.965 + 0.300 \times 0.854 + 0.854^2)^2 - 4 \times 0.854^2} \right] = 0.692 \]
The minimum stability factor is 0.572.

From GB50017-2017 Clause 7.3.1-5, when $\lambda > 80\epsilon_k$, the formula 7.3.1-7 should be used to get the value of width thickness ratio of compression member. Here, $97.33 > 80 \times 1$.

Limit value of width to thickness ratio $= 5 \epsilon_k + 0.125 \lambda = 5 + 0.125 \times 97.33 = 17.17$.

According to Clause 7.3.2 of GB50017-2017, $\phi Af = 0.572 \times 2,760 \times 215 = 339.4 kN < N = 416.2 kN$

Therefore, the limit value of width to thickness ratio without magnification.

According to formula 7.3.1-7 of GB50017-2017, $w = b - 2t = 100 - 2 \times 7 = 86 mm$

\[
\frac{w}{t} = \frac{86}{7} = 12.29 < 17.17
\]

Actual value
Limit value
\[
\frac{12.29}{17.17} = 0.72 < 1.0
\]

The double angle members are composed of equilateral single angle. So, the check process of the height thickness ratio of compression web is consistent with that of width thickness ratio of compression flange. Thus, OK.

Stability of the compression member: according to formula (7.2.1) of GB50017-2017:

\[
\frac{N}{\phi Af} = \frac{416,200}{0.572 \times 2,760 \times 215} = 1.23 > 1.0, \text{ Failed}
\]

Shear Strength

According to formula (7.2.7) of GB50017-2017,

\[
V = \frac{A \times f}{85\epsilon_k} = \frac{2,760 \times 215}{85 \times 1} = 6,981 N
\]

Then, according to formula (6.1.3) of GB50017-2017,

\[
\tau = \frac{VS}{Trw} = \frac{6,981 \times 36,700}{2,630,000 \times 14} = 6.957 N/mm^2
\]

Therefore, the ratio is:

\[
\frac{\tau}{\tau_v} = \frac{6.957}{125} = 0.06
\]

V. GB500017-2017 H Section Subject to Bending

Verify the strength, stability, and deflection of an H section subject to bending per GB50017-2017.

Reference

Problem
The section is an HN500x200 with a length of 2.5 m. The structure is a two-story frame. Member #40 assigned with an H-section (HN500x200) is designed per GB 50017-2017. The section has an unbraced length of 1.0 m about the x direction and 2.5 m about the y direction.

Material Properties
The material is Q235 type steel.

- Design strength in tension, compression, and flexure: $f_y = 215$ MPa
- Design strength in shear: $f_v = 125$ MPa

Section Properties
- Section depth, $h = 500$ mm
- Section width, $b = 200$ mm
- Flange thickness, $t_f = 16$ mm
- Web thickness, $t_w = 10$ mm
- Cross-sectional area, $A = 11,225$ mm$^2$
- Moment of inertia about x, $I_x = 468,110,000$ mm$^4$
- Moment of inertia about y, $I_y = 21,380,000$ mm$^4$
- Radius of gyration about x, $i_x = 204.2$ mm
- Radius of gyration about y, $i_y = 43.6$ mm
- Area moment about x, $S_x = 1,872,400$ mm$^3$
- Area moment about y, $S_y = 213,800$ mm$^3$

Calculations
Slenderness Ratio
The effective length is:

$$l_{oy} = l_y = 2,500$$ mm

According to the formula (c.0.1-2) in Appendix C, the slenderness ratio is:

$$\lambda_y = \frac{l_{oy}}{i_y} = \frac{2,500}{43.6} = 57.3$$

Steel Grade Correction Factor
The steel type is Q235. According to note 1 in table 3.5.1 of *Standard for design of steel structures* and table 1 of *Standard for design of steel structures. Commentary 2.2*, the steel grade correction coefficient is $\varepsilon_k = 1$.

Overall Stability Coefficient
According to the formula (c.0.5-1) in Appendix C of *Standard for design of steel structures*, the overall stability coefficient of the beam determined by the bending around the strong axis is calculated as:

\[
\phi_{bx} = \phi_b = 1.07 - \frac{\lambda_y^2}{44,000\varepsilon_k} = 1.07 - \frac{(57.3)^2}{44,000} = 0.995
\]

**Plastic Development Coefficient**

According to clause 6.1.2 of *Standard for design of steel structures*, and the width thickness ratio of cross-section plate is grade S3,

\[
y_x = 1.05 \quad \quad y_y = 1.20
\]

**Check Web Thickness to Height Ratio**

The calculated height of the web does not include the chamfering arc segment,

\[
h_0 = 500 \text{ mm} - 2 \times (16 \text{ mm}) = 468 \text{ mm}
\]

\[
\frac{h_0}{t_f} = \frac{468}{10} = 46.8
\]

According to table 3.5.1 of *Standard for design of steel structures*, and the width thickness ratio of cross-section plate is grade S3, so the limit value of height thickness ratio is:

\[
93\varepsilon_k = 93
\]

Ratio: \(\frac{46.8}{93} = 0.50\)

**Check Flange Thickness to Width Ratio**

The overhanging width of flange does not include chamfering arc segment,

\[
b_0 = \frac{b - t_w}{2} = \frac{200 - 10}{2} = 95 \text{ mm}
\]

\[
\frac{b_0}{t_f} = \frac{95}{16} = 5.94
\]

According to table 3.5.1 of *Standard for design of steel structures*, and the width thickness ratio of cross-section plate is grade S3, so the limit value of width thickness ratio is:

\[
13\varepsilon_k = 13
\]

Ratio: \(\frac{5.94}{13} = 0.46\)

**Check Overall Stability**

The controlling load condition for the overall stability is combination 59. F : 1.35DL+0.84WF:

\[
M_x = -111.2 \text{ kN m} \\
M_y = 2.68 \text{ kN m} \\
\frac{M_x}{\phi_{bx}W_xf} + \frac{M_y}{\gamma_y W_yf} \quad \text{ (Cl. 6.2.3)} \\
\frac{-111.2(10)^6}{0.995 \times 1,872,400 \times 215} + \frac{2.67(10)^6}{1.2 \times 213,800 \times 215} = 0.33
\]
Deflection

From the STAAD analysis, the maximum displacement of the beam is 5.8 mm. The total length of the physical beam member is 10 m.

\[
\text{Deflection ratio} = \frac{5.8}{10,000} = \frac{1}{1,730}
\]

According to table B.1.1 of Appendix B of Standard for design of steel structures, the allowable deflection ratio is 1/400.

\[
\frac{1}{1,730} = 0.23
\]

Equivalent Stress in Beam

The controlling load condition for equivalent stress is combination 56. F : 1.35DL+0.98LL+0.84WL:

\[
M = -111.2 \text{ kN} \cdot \text{m}
\]

\[
V = 43.3 \text{ kN}
\]

According to clause 6.1.5 of Standard for design of steel structures and taking the top of web as the calculation point, the distance from calculated point to neutral axis of beam:

\[
y_1 = \frac{h - 2t_f}{2} = \frac{500 - 2 \times 16}{2} = 234 \text{ mm}
\]

The normal stress:

\[
\sigma = \frac{M}{I_n y_1} = \frac{-111,200,000 \text{ N} \cdot \text{mm}}{468,110,000 \text{ mm}^4 \times 234 \text{ mm}} = -55.6 \text{ N/mm}^2
\]

According to clause 6.1.3 of Standard for design of steel structures and taking the top of web as the calculation point, calculate the area moment of the above rough section to the neutral axis at the shear stress:

\[
S = 774,400 \text{ mm}^3
\]

Shear stress:

\[
\tau = \frac{V S}{I_w} = \frac{43,300 \text{ N} \times 774,400 \text{ mm}^3}{468,110,000 \text{ mm}^4 \times 10 \text{ mm}} = 7.163 \text{ N/mm}^2
\]

According to clause 6.1.5 of Standard for design of steel structures, the local compressive stress \(\sigma_c = 0\), so \(\beta_1 = 1.1\). The resultant stress is:

\[
\sqrt{\sigma^2 + \sigma_c^2 - \sigma_c \sigma + 3\tau^2} = \sqrt{(-55.6)^2 + 0^2 - 0 \times (-55.6) + 3 \times (7.16)^2} = 57.0 \text{ N/mm}^2
\]

The allowable stress:

\[
\beta_1 f = 1.1 \times 215 \text{ N/mm}^2 = 237 \text{ N/mm}^2
\]

\[
\sqrt{\sigma^2 + \sigma_c^2 - \sigma_c \sigma + 3\tau^2} < \beta_1 f
\]

Ratio:

\[
\frac{\sqrt{\sigma^2 + \sigma_c^2 - \sigma_c \sigma + 3\tau^2}}{\beta_1 f} = \frac{57.0}{237} = 0.24
\]

Shear Strength

The controlling load condition for shear is combination 10. F : 1.20DL+1.40LL+0.84WL:
\[ V_y = 49.9 \text{ kN} \]
\[ V_z = 540.3 \text{ kN} \]

Take the neutral axis as the calculation point of shear stress, calculate the area moment:
\[ S_y = 1,048,000 \text{ mm}^3 \]

According to clause 6.1.3 of *Standard for design of steel structures*, shear stress
\[ \tau = \frac{VS}{Tw} = \frac{49,900 \text{ N} \times 1,048,000 \text{ mm}^3}{468,110,000 \text{ mm}^4 \times 10\text{ mm}} = 11.18 \text{ N/mm}^2 \]

Therefore, the ratio is:
\[ \frac{\tau}{f_v} = \frac{11.18}{125} = 0.09 \]

**Bending Strength**

The controlling load condition for bending is combination 59. F: 1.35DL+0.84WF:
\[ M_x = -111.2 \text{ kN\,m} \]
\[ M_y = 2.68 \text{ kN\,m} \]

According to Clause 6.1.1 of *Standard for design of steel structures*,
\[ \frac{M_x}{W_{nx}} + \frac{M_y}{W_{ny}} = \frac{111,200,000}{1.05 \times 1,872,400} + \frac{2,680,000}{1.20 \times 213,800} = 67.0 \text{ N/mm}^2 \]

Ratio:
\[ \frac{M_x}{W_{nx}} + \frac{M_y}{W_{ny}} f = \frac{67.0}{215} = 0.31 \]

**Comparison**

V. GB500017-2017 H-section with Combined Axial and Bending

Verify the strength, stability, and slenderness of an H section subject to combined axial and bending per GB50017-2017.

Reference

Problem

The section is an HN400x408 with a length of 9 m. The structure is a two-story frame. Member #1 assigned with an H-section (HN400x408) is designed per GB 50017-2017. The section has an unbraced length of 4.5 m about the x direction and 9 m about the y direction.

Material Properties

The material is Q235 type steel.

Design strength in tension, compression, and flexure: $f_y = 205 \text{ MPa}$

Design strength in shear: $f_v = 120 \text{ MPa}$
Section depth, \( h = 400 \text{ mm} \)
Section width, \( b = 408 \text{ mm} \)
Flange thickness, \( t_f = 21 \text{ mm} \)
Web thickness, \( t_w = 21 \text{ mm} \)
Cross-sectional area, \( A = 25,069 \text{ mm}^2 \)
Moment of inertia about \( x \), \( I_x = 708,880,000 \text{ mm}^4 \)
Moment of inertia about \( y \), \( I_y = 238,090,000 \text{ mm}^4 \)
Radius of gyration about \( x \), \( i_x = 168.2 \text{ mm} \)
Radius of gyration about \( y \), \( i_y = 97.5 \text{ mm} \)
Area moment about \( x \), \( S_x = 3,544,400 \text{ mm}^3 \)
Area moment about \( y \), \( S_y = 1,167,100 \text{ mm}^3 \)

### Calculations

#### Slenderness Ratio

The effective length is:

\[
\begin{align*}
I_{ox} &= \mu_x \times l_x = 1.581 \times 4,500 \text{ mm} = 7,115 \text{ mm} \\
I_{oy} &= \mu_y \times l_y = 1.319 \times 9,000 \text{ mm} = 11,870 \text{ mm}
\end{align*}
\]

The slenderness ratio is:

\[
\begin{align*}
\lambda_x &= \frac{l_{ox}}{i_x} = \frac{7,115}{168.2} = 42.3 < 150 \\
\lambda_y &= \frac{l_{oy}}{i_y} = \frac{11,870}{97.5} = 121.8 < 150
\end{align*}
\]

Ratio for tension slenderness: \( \frac{42.3}{150} = 0.28 \)
Ratio for compression slenderness: \( \frac{121.8}{150} = 0.81 \)

#### Steel Grade Correction Factor

The steel type is Q235. According to note 1 in table 3.5.1 of *Standard for design of steel structures* and table 1 of *Standard for design of steel structures. Commentary 2.2*, the steel grade correction coefficient is \( \varepsilon_k = 1 \).

#### Overall Stability Coefficient

According to the formula (C.0.1) in Appendix C of *Standard for design of steel structures*, the overall stability coefficient of the beam determined by the bending around the strong axis is calculated as:

\[
\phi_{bx} = \beta_b \frac{4320}{i_y^2} \times \frac{Ah}{W_y} \left[ \sqrt{1 + \left( \frac{A_y i_1}{4.4 h} \right)^2} + \eta_b \right] \varepsilon_k
\]

\[
= 0.765 \times \frac{4,320}{(121.8)^2} \times \frac{250,691 \times 400}{354,400} \left[ \sqrt{1 + \left( \frac{121.8 \times 21}{4.4 \times 400} \right)^2} + 0 \right] \times 1 = 1.113 > 0.6
\]

According to the formula (c.0.1-7) in Appendix C of *Standard for design of steel structures*,

\[
\phi_{bx'} = 1.07 \times 0.282 \frac{1}{1.113} = 0.817 < 1.0
\]

So, for the section in x-x direction, \( \phi_{bx} = 1.0 \).

### Stability Factor for Axial Compression

---

*STAAD.Pro User Manual*
According to the formula (D.0.5) in Appendix D of *Standard for design of steel structures*,

For section y-y direction:
\[
\lambda_n = \frac{\lambda_y \pi f_y E}{121.8 \pi^2 225 \times 206,000} = 1.281
\]

Class c, so, the coefficients are \(\alpha_1 = 0.730\), \(\alpha_2 = 1.126\), and \(\alpha_3 = 0.302\).

Since \(\lambda_n = 1.281 > 0.215\), then the stability factor in y:
\[
\phi_y = \frac{1}{2 \times 1.281^2} \left[ (1.216 + 0.302 \times 1.281 + 1.281^2) \cdot \sqrt{(1.216 + 0.302 \times 1.281 + 1.281^2)^2 - 4 \times 1.281^2} \right] = 0.382
\]

For section x-x direction:
\[
\lambda_n = \frac{\lambda_y \pi f_y E}{42.3 \pi^2 225 \times 206,000} = 0.445
\]

Class b, so, the coefficients are \(\alpha_1 = 0.650\), \(\alpha_2 = 0.965\), and \(\alpha_3 = 0.300\).

Since \(\lambda_n = 0.445 > 0.215\), then the stability factor in x:
\[
\phi_x = \frac{1}{2 \times 0.445^2} \left[ (0.965 + 0.300 \times 0.445 + 0.445^2) \cdot \sqrt{(0.965 + 0.300 \times 0.445 + 0.445^2)^2 - 4 \times 0.445^2} \right] = 0.893
\]

**Equivalent Moment Factor**

The critical buckling load:
\[
N_{cry} = \frac{n^2 EI_y}{(\mu_y l_y)^2} = \frac{n^2 \times 206,000 \times 238,090,000}{(1.319 \times 9,000)^2} = 3,435,000 \text{ N}
\]
\[
N_{crx} = \frac{n^2 EI_x}{(\mu_x l_x)^2} = \frac{n^2 \times 206000 \times 708,880,000}{(1.581 \times 4,500)^2} = 28,474,000 \text{ N}
\]

For an unbraced frame:
\[
\beta_{my} = 1 - \frac{0.36 N}{N_{cry}} = 1 - 0.36 \times \frac{181.1}{3,435} = 0.981
\]
\[
\beta_{mx} = 1 - \frac{0.36 N}{N_{crx}} = 1 - 0.36 \times \frac{181.1}{28,474} = 0.998
\]

Because there is a reverse bending point, \(M1\) and \(M2\) have different signs:
\[
\beta_{tx} = 0.65 + 0.35 M_2 / M_1 = 0.65 \cdot 0.35 \times 12.66 / 174.5 = 0.625
\]
\[
\beta_{ty} = 0.65 + 0.35 M_2 / M_1 = 0.65 \cdot 0.35 \times 7.39 / 57.06 = 0.605
\]

**Section influence coefficient**, \(\eta = 1.0\)

**Plastic Development Coefficient**
According to clause 6.1.2 of *Standard for design of steel structures*, and the width thickness ratio of cross-section plate is grade S3, 
\[ \gamma_x = 1.05 \]
\[ \gamma_y = 1.20 \]

**Check Web Thickness to Height Ratio**

Calculated the web height:
\[ h_0 = 400 - 21 - 21 = 358 \text{ mm} \]
\[ \frac{h_0}{t_w} = \frac{458}{21} = 17.05 \]

According to table 3.5.1 of *Standard for design of steel structures*, and the width thickness ratio of cross-section plate is grade S3, so the limit value of height thickness ratio is:
\[ 40 + 18 \times a_0^{1.5} \]
where
\[ a_{\text{max}} = \frac{N_x}{A} + \frac{M_x}{W_{z-web}} = \frac{176,800}{25,069} + \frac{16,000 \times (400 - 21 - 21)}{708,800,000 \times 2} = 7.056 \]

where
\[ a_{\text{min}} = \frac{N_x}{A} - \frac{M_x}{W_{z-web}} = \frac{176,800}{25,069} - \frac{16,000 \times (400 - 21 - 21)}{708,800,000 \times 2} = 7.048 \]

where
\[ a_0 = \frac{a_{\text{max}} - a_{\text{min}}}{a_{\text{max}}} = \frac{7.056 - 7.048}{7.056} = 0.001 \]

Therefore, the limit value is: 
\[ 40 + 18 \times 0.001^{1.5} = 40.00 \]

Ratio: \[ \frac{17.05}{40.00} = 0.43 \]

**Check Flange Thickness to Width Ratio**

\[ b_0 = \frac{b \cdot t_w}{2} = \frac{408 \cdot 21}{2} = 194 \text{ mm} \]
\[ \frac{b_0}{t_f} = \frac{193}{21} = 9.21 \]

According to table 3.5.1 of *Standard for design of steel structures*, and the width thickness ratio of cross-section plate is grade S3, so the limit value of width thickness ratio is:
\[ 13 \epsilon_k = 13 \]

Ratio: \[ \frac{9.21}{13} = 0.71 \]

**Shear Strength**

The controlling load condition for shear is combination 10. F : 1.20DL+1.40LL+0.84WL:
\[ V_x = 46.5 \text{ kN} \]
\[ V_y = 9.52 \text{ kN} \]

Take the neutral axis as the calculation point of shear stress, calculate the area moment:
\[ S_x = 1,960,000 \text{ mm}^3 \]
\[ S_y = 893,700 \text{ mm}^3 \]

According to clause 6.1.3 of *Standard for design of steel structures*, shear stress

\[ \tau_x = \frac{V}{I_{tw}} = \frac{46,500 \text{ N} \times 1,960,000 \text{ mm}^3}{708,880,000 \text{ mm}^4 \times 21 \text{ mm}} = 6.12 \text{ N/mm}^2 \]

\[ \tau_y = \frac{V}{I_{tw}} = \frac{9,526 \text{ N} \times 893,700 \text{ mm}^3}{238,090,000 \text{ mm}^4 \times 21 \text{ mm}} = 0.85 \text{ N/mm}^2 \]

\[ \tau_{\text{max}} = 6.12 < f_v = 120 \text{ N/mm}^2 \]

Therefore, the ratio is:

\[ \frac{\tau}{f_v} = \frac{6.12}{120} = 0.05 \]

**Check In-plane Stability**

The controlling load condition for in-plane stability is combination 14. F : 1.2DL+1.4LL+0.84WF:

\[ M_x = 174.8 \text{ kN} \cdot \text{m} \]
\[ M_y = 58.75 \text{ kN} \cdot \text{m} \]
\[ N = 181.2 \text{ kN} \]

According to clause 8.2.5 of *Standard for design of steel structures*,

\[ N_{Ex} = \frac{n^2EA}{1.1\lambda_x} = \frac{n^2206,000 \times 25,069}{1.1 \times 42.3^2} = 25,900 \text{ kN} \]

\[ \frac{N}{\varphi_x M} + \frac{\beta_{mx} M_x}{y_x W_x \left( 1 - 0.8 \frac{N}{N_{Ex}} \right) f} + \eta \frac{\beta_{ty} M_y}{\varphi_{by} W_y f} \quad \text{(Cl. 8.2.5)} \]

\[ = \frac{181.2}{0.893 \times 25,069 \times 205} + \frac{0.981 \times 174.8 \times 10^6}{1.05 \times 3,544,400 \times (1 - 0.8 \frac{181.2}{25,900}) \times 205} + 1.0 \times \frac{0.605 \times 58.75 \times 10^6}{1.0 \times 1,167,110 \times 205} = 0.42 < 1.0 \]

**Check Out-of-plane Stability**

The controlling load condition for in-plane stability is combination 14. F : 1.2DL+1.4LL+0.84WF:

\[ M_x = 174.8 \text{ kN} \cdot \text{m} \]
\[ M_y = 58.75 \text{ kN} \cdot \text{m} \]
\[ N = 181.2 \text{ kN} \]

According to clause 8.2.5 of *Standard for design of steel structures*,

\[ N_{Ex} = \frac{n^2EA}{1.1\lambda_x} = \frac{n^2206,000 \times 25,069}{1.1 \times 121.8^2} = 3,123 \text{ kN} \]

\[ \frac{N}{\varphi_x M} + \frac{\beta_{mx} M_x}{y_x W_x \left( 1 - 0.8 \frac{N}{N_{Ex}} \right) f} + \eta \frac{\beta_{ty} M_y}{\varphi_{by} W_y f} \quad \text{(Cl. 8.2.5)} \]

\[ = \frac{181.2 \times 1000}{0.382 \times 25,069 \times 205} + \frac{0.981 \times 58.75 \times 10^6}{1.2 \times 1,167,100 \times (1 - 0.8 \frac{181.2}{3,123}) \times 205} + 1.0 \times \frac{0.625 \times 174.8 \times 10^6}{0.817 \times 3,544,400 \times 205} = 0.49 < 1.0 \]
Strength of the Member

The controlling load condition for strength is combination 14. \( F : 1.2DL + 1.4LL + 0.84WF \):

According to Clause 8.1.1 of *Standard for design of steel structures*,

\[
\frac{N}{A_y f_y} + \frac{M_x}{r_x W_{n_x} f_y} + \frac{M_y}{r_y W_{n_y} f_y} = \frac{181.2 \times 10^6}{25,069 \times 205} + \frac{174.8 \times 10^6}{1.05 \times 3,544,400 \times 205} + \frac{58.75 \times 10^6}{1.20 \times 1,187,100 \times 205} = 0.47
\]

### V. GB500017-2017 Pipe section with Combined Axial and Bending

Verify the strength, stability, and slenderness of a pipe section subject to combined axial and bending per GB50017-2017.
Reference

Problem

The section is a PIP299x10.0 with a length of 4 m. The structure is a portal frame. Member #3 assigned with a pipe section (PIP299x10.0) is designed per GB 50017-2017. The section has an unbraced length of 4 m in either direction. The governing load case #1 has the following ultimate loads on the member:

- \( F_x = 24.45 \text{ kN} \)
- \( F_y = 34.94 \text{ kN} \)
- \( N = 93.30 \text{ kN} \)
- \( M_x = -76.7 \text{ kN} \cdot \text{m} \) (at member end)
- \( M_y = 117.8 \text{ kN} \cdot \text{m} \) (at member end)

Material Properties

The material is Q235 type steel.

- Design strength in tension, compression, and flexure: \( f_y = 215 \text{ MPa} \)
- Design strength in shear: \( f_v = 125 \text{ MPa} \)

Section Properties

- Outside diameter, \( D = 299 \text{ mm} \)
- Wall thickness, \( t = 10 \text{ mm} \)
- Cross-sectional area, \( A = 9,079 \text{ mm}^2 \)
- Moment of inertia about \( x, I = 94,902.00 \text{ mm}^4 \)
- Radius of gyration about \( x, r = 102.2 \text{ mm} \)
- Area moment about \( x, S = 417,600 \text{ mm}^3 \)

Calculations

Slenderness Ratio

The effective length is:

\[
\begin{align*}
\ell_{ox} &= \mu_x \times l_x = 1.297 \times 4,000 \text{ mm} = 5,188 \text{ mm} \\
\ell_{oy} &= \mu_y \times l_y = 2.0383 \times 4,000 \text{ mm} = 8,150 \text{ mm}
\end{align*}
\]

The slenderness ratio is:

\[
\lambda_x = \frac{\ell_{ox}}{r_x} = \frac{5,188}{102.2} = 50.73 < 150
\]

\[
\lambda_y = \frac{\ell_{oy}}{r_y} = \frac{8,150}{102.2} = 79.72 < 150
\]

According to table 7.4.6 of *Standard for design of steel structures*, the allowable slenderness ratio of compression members is \( \lambda_{clim} = 150 \).

Ratio: \( \lambda_{max} / \lambda_{clim} = 79.92 / 150 = 0.53 \)
According to Table 7.4.7 of the Standard for Design of Steel Structures, the allowable slenderness ratio of tension members is $\lambda_{\text{lim}} = 300$.

Ratio: $\lambda_{\max} / \lambda_{\text{lim}} = 79.92 / 300 = 0.27$

**Steel Grade Correction Factor**

The steel type is Q235. According to note 1 in Table 3.5.1 of the Standard for Design of Steel Structures and Table 1 of the Standard for Design of Steel Structures. Commentary 2.2, the steel grade correction coefficient is $\varepsilon_k = 1$.

**Check Diameter to Thickness Ratio**

$$\frac{D}{t} = \frac{299}{10} = 29.9$$

According to Table 3.5.1 of the Standard for Design of Steel Structures, and the width thickness ratio of cross-section plate is grade S3, so the limit value of height thickness ratio is:

$$93\varepsilon_k = 93$$

Ratio: $\frac{29.9}{90} = 0.33$

**Plastic Development Coefficient**

According to clause 8.1.1-2 of the Standard for Design of Steel Structures, and the width thickness ratio of cross-section plate is grade S3, $\gamma_m = 1.15$

**Check Member Strength**

According to clause 8.1.1-2 of the Standard for Design of Steel Structures,

$$\sigma = \frac{N}{A_n} + \frac{\sqrt{M_x^2 + M_y^2}}{Y \gamma_m W_n} = \frac{93.3 \times 10^3}{9,079} + \frac{\sqrt{(76.7 \times 10^6)^2 + (117.8 \times 10^6)^2}}{1.15 \times 634,800} = 202.8 \text{ N/mm}^2$$

Ratio: $\frac{\sigma}{f} = \frac{202.8}{215} = 0.94$

**Check Member Stability**

According to Table 7.2.1-1 of the Standard for Design of Steel Structures, the section is "a" for this section.

According to the formula (D.0.5) in Appendix D of the Standard for Design of Steel Structures,

For section x-x direction:

$$\lambda_n = \frac{\lambda_y}{\gamma} \sqrt{\frac{F_y}{E}} = \frac{50.73}{\sqrt{\frac{225}{206,000}}} = 0.545$$

Class a, so, the coefficients are $a1 = 0.41$, $a2 = 0.986$, and $a3 = 0.152$.

Since $\lambda_n = 0.545 > 0.215$, then the stability factor in x:

$$\phi_x = \frac{1}{2\lambda_n^2} \left[ (a_2 + a_3\lambda_n + \lambda_n^2) \cdot \sqrt{(a_2 + a_3\lambda_n + \lambda_n^2)^2 \cdot 4\lambda_n^2} \right]$$

$$= \frac{1}{2 \times 0.545^2} \left[ (0.986 + 0.152 \times 0.545 + 0.545^2) \cdot \sqrt{(0.986 + 0.152 \times 0.545 + 0.545^2)^2 \cdot 4 \times 0.545^2} \right] = 0.914$$

For section y-y direction:
\[ \lambda_n = \frac{\lambda_y}{\pi} \sqrt{\frac{T_y}{E}} = \frac{79.72}{\pi} \sqrt{\frac{225}{206,000}} = 0.857 \]

Class a, so, the coefficients are \( \alpha_1 = 0.41 \), \( \alpha_2 = 0.986 \), and \( \alpha_3 = 0.152 \).

Since \( \lambda_n = 0.875 > 0.215 \), then the stability factor in x:

\[
\phi_x = \frac{1}{2 \lambda_n} \left[ (\alpha_2 + \alpha_3 \lambda_n + \lambda_n^2) - \sqrt{(\alpha_2 + \alpha_3 \lambda_n + \lambda_n^2)^2 - 4 \lambda_n^2} \right]
\]

\[
= \frac{1}{2 \times 0.857} \left[ (0.986 + 0.152 \times 0.857 + 0.857^2) - \sqrt{(0.986 + 0.152 \times 0.857 + 0.857^2)^2 - 4 \times 0.857^2} \right] = 0.785
\]

So, \( \phi_{\text{min}} = 0.785 \)

Equivalent Moment Factor

According to formula 8.2.4-6 of Standard for design of steel structures:

\[ N_E = \frac{n^2 E A}{\lambda_n^2} = \frac{n^2 \times 206,000 \times 9,079}{79.72^2} = 2,904,600 \text{ N} \]

According to the note of formula 8.2.4 of Standard for design of steel structures:

\[ M_{1x} = -76.7 \text{ kN·m} \]
\[ M_{2x} = 63.06 \text{ kN·m} \]
\[ M_{1y} = 117.8 \text{ kN·m} \]
\[ M_{2y} = -0.006 \text{ kN·m} \]

According to formula 8.2.4-4 of Standards for design of steel structures:

\[ \beta_x = 1 - 0.35 \sqrt{\frac{N}{N_E}} + \frac{\sqrt{N \cdot W_{2x}}}{1x} = 1 - 0.35 \times \sqrt{\frac{93.3}{2,905}} + 0.35 \times \sqrt{\frac{93.3 \times 63.06}{2,905 \times 76.7}} = 0.886 \]

According to formula 8.2.4-5 of Standards for design of steel structures:

\[ \beta_y = 1 - 0.35 \sqrt{\frac{N}{N_E}} + \frac{\sqrt{N \cdot W_{2y}}}{1y} = 1 - 0.35 \times \sqrt{\frac{93.3}{2,905}} + 0.35 \times \sqrt{\frac{0.006 \times 63.06}{117.8 \times 76.7}} = 0.937 \]

According to formula 8.2.4-5 of Standards for design of steel structures:

\[ \beta = \beta_x \beta_y = 0.886 \times 0.937 = 0.830 \]

According to formula 8.2.1-2 of Standard for design of steel structures:

\[ N'_{\text{Ex}} = \frac{n^2 E A}{1.1 \lambda_{\text{max}}^2} = \frac{n^2 \times 206,000 \times 9,079}{1.1 \times 79.72^2} = 2,640,500 \text{ N} \]

According to the note of formula 8.2.4-2 of Standard for design of steel structures:

\[ M_{xA} = 63.06 \text{ kN·m} \]
\[ M_{yA} = -0.006 \text{ kN·m} \]
\[ M_{xB} = -76.7 \text{ kN·m} \]
\[ M_{yB} = 117.8 \text{ kN·m} \]
\[ \sqrt{M_{xA}^2 + M_{yA}^2} = \sqrt{(63.06)^2 + (-0.006)^2} = 63.06 \text{ kN·m} \]
\[
\sqrt{M_x B^2 + M_y B^2} = \sqrt{(-76.7)^2 + (117.8)^2} = 140.6 \text{ kN·m}
\]

\[
M_{\text{max}} = 140.6 \text{ kN·m}
\]

According to the note of formula 8.2.4-2 of *Standard for design of steel structures*:

\[
\frac{N \phi A_f}{\gamma_m W} + \frac{\beta M}{N E_x} f = \frac{93.3 \times 10^3}{0.875 \times 9,079 \times 215} + \frac{0.830 \times 140.6 \times 10^6}{1.15 \times 634,792 \left(1 - 0.8 \frac{93.3}{2,641}\right)^2 215} = 0.826
\]

**Shear Strength**

Take the neutral axis as the calculation point of shear stress, calculate the area moment:

\[
S = 417,605 \text{ mm}^3
\]

According to clause 6.1.3 of *Standard for design of steel structures*, shear stress

\[
\tau_x = \frac{V S}{I \ell_w} = \frac{29,449 \times 417,605}{94,902,000 \times 20} = 6.48 \text{ N/mm}^2
\]

\[
\tau_x = \frac{V S}{I \ell_w} = \frac{34,940 \times 417,605}{94,902,000 \times 20} = 7.69 \text{ N/mm}^2
\]

\[
\tau_{\text{max}} = 7.69 < f_v = 125 \text{ N/mm}^2
\]

Therefore, the ratio is:

\[
\frac{\tau}{f_v} = \frac{7.89}{125} = 0.06
\]

**Comparison**

V. GB500017-2017 Single Angle section with Axial Force

Verify the slenderness, strength, and stability of a single-angle section subject to axial force per GB50017-2017.

Reference

Problem

The section is an L100x100x6 with a length of 3.005 m. The structure is a truss model. Member #34 assigned with single angle section (L100x100x6) is designed per GB 50017-2017. The governing load combination (#4) is 1.2 DL + 1.4 LL and the ultimate force on the member, \( N \), is 92.06 kN of axial compression.

The material is Q235 type steel.

- Design strength in tension, compression, and flexure: \( f_y = 215 \text{ MPa} \)
- Design strength in shear: \( f_v = 125 \text{ MPa} \)

Calculations

Section Properties
Side length, \( b = h = 100 \text{ mm} \)
Thickness, \( t = 6 \text{ mm} \)
Cross-sectional area, \( A = 1,193 \text{ mm}^2 \)
Moment of inertia about \( x \), \( I_x = 479,000 \text{ mm}^4 \)
Moment of inertia about \( y \), \( I_y = 1,820,000 \text{ mm}^4 \)
Radius of gyration about \( x \), \( i_x = 20.04 \text{ mm} \)
Radius of gyration about \( y \), \( i_y = 39.06 \text{ mm} \)
Area moment about \( x \), \( S_x = 15,890 \text{ mm}^3 \)
Area moment about \( y \), \( S_y = 31,690 \text{ mm}^3 \)

Slenderness Ratio

According to Table 7.4.1-1 of GB50017-2017, effective length of double angle is:

\[
\begin{align*}
\lambda_{ox} &= \mu_x l_x = 0.8 \times 3,005 \text{ mm} = 2,404 \text{ mm} \\
\lambda_{oy} &= \mu_y l_y = 1.0 \times 3,005 \text{ mm} = 3,005 \text{ mm}
\end{align*}
\]

According to formula 7.2.1-1 and 2 of steel structures code, slenderness ratio of double angle with \( X \) axis and \( Y \) axis is:

\[
\begin{align*}
\lambda_x &= \frac{l_{ox}}{i_x} = \frac{2,404}{20.04} = 119.8 \\
\lambda_y &= \frac{l_{oy}}{i_y} = \frac{3,005}{39.06} = 76.94
\end{align*}
\]

According to formula 7.2.2-3 and 7.2.2.-4 of steel structures code, torsional buckling equivalent slenderness ratio of single angle is calculated as follows.

The relative coordinates from the centroid to the heel (corner) of the angle are:

\[
\begin{align*}
x_c &= 27.23 \text{ mm} \\
y_c &= 27.23 \text{ mm}
\end{align*}
\]

The distance from the centroid to the shear center, \( y_s^2 \):

\[
y_s^2 = 2 \times (x_c \cdot \frac{t}{2})^2 = 2 \times (27.23 \cdot \frac{6}{2})^2 = 1,174 \text{ mm}^2
\]

The polar radius of gyration of the shear center, \( i_0 \):

\[
i_0^2 = i_x^2 + i_y^2 = 1,174 + 20.04^2 + 39.06^2 = 3,101 \text{ mm}^2
\]

Polar moment of inertia of gross angle to the shear center, \( I_0 \):

\[
I_0 = i_0^2 A = 3,101 \times 1,193 = 3,700,000 \text{ mm}^4
\]

The free torsion constant of shear center on gross angle section. The correction factor for the free torsion factor, \( k = 1.2 \).

\[
I_t = (I_{t1} + I_{t2})k = \left(\frac{b t^3}{3} + \frac{(b - t) t^3}{3}\right)k = \frac{k(2b - t) t^3}{3} = \frac{1.2 \times (2 \times 100 - 6) \times (6)^3}{3} = 16,760 \text{ mm}^4
\]

Fan moment of inertia of the gross angle section to shear center, \( I_{\omega} \):

\[
I_{\omega} = \frac{t^3 b^3}{18} = \frac{(6)^3 (100)^3}{18} = 12,000,000 \text{ mm}^6
\]
Length for torsional buckling, $l_\omega = 2,404\ mm$. The torsional buckling equivalent slenderness ratio, $\lambda_z^2$:

$$\lambda_z^2 = \frac{I_0}{I_t/25.7 + I_\omega/2\omega^2} = \frac{3,700,000}{16,762/25.7 + 12,000,000/2,404^2} = 5,655$$

Calculate the slenderness ratio for flexural torsional buckling, $\lambda_{yz}$:

$$\lambda_{yz} = \sqrt{\left(\frac{\lambda_y^2 + \lambda_z^2}{\lambda_y^2 + \lambda_z^2} + \frac{1}{4} \frac{\lambda_y^2 \lambda_z^2}{\lambda_y^2 + \lambda_z^2}\right) \frac{1}{2}}$$

$$= \sqrt{\left(\frac{(120.0^2 + 5,655)}{(120.0^2 + 5,655)^2} + \frac{1}{4} \frac{120.0^2 \times 5,655}{120.0^2 + 5,655}\right) \frac{1}{2}} = 130.7$$

The maximum slenderness ratio of the single angle section, $\lambda_{\text{max}} = 130.7$

The limit of slenderness ratio of compression member is 150 according to table 7.4.6 of steel structures code.

$$\frac{\lambda_{\text{max}}}{\lambda_{\text{limit}}} = \frac{130.7}{150} = 0.87 < 1.0, \text{ Passed}$$

The limit of slenderness ratio of tension member is 300 according to table 7.4.7 of steel structures code.

$$\frac{\lambda_{\text{max}}}{\lambda_{\text{limit}}} = \frac{130.7}{300} = 0.44 < 1.0, \text{ Passed}$$

**Tension or Compression Strength**

According to Table 7.1.3 of GB50017-2017, the $\eta = 0.85$.

According to formula 7.1.1-1 of steel structures code, the stress of single angle with gross cross-section area is:

$$\sigma = \frac{N}{\eta A} = \frac{92,060}{0.85 \times 2,760} = 90.79$$

According to clause 7.6.1-1 of steel structures code, reduction factor of strength design value of angle is 0.85.

$$0.85f = 0.85 \times 215 = 182.8\ \text{N/mm}^2$$

And the ratio is:

$$\frac{\sigma}{0.85f} = \frac{90.79}{187.8} = 0.50$$

According to formula 7.1.1-2 of the steel structures code, the strength ratio is:

$$0.85f_u = 0.85 \times 370 = 314.5\ \text{N/mm}^2$$

And the ratio is:

$$\frac{\sigma}{0.7f_u} = \frac{90.79}{0.7 \times 314.5} = 0.41$$

**Steel Grade Correction Factor**

The steel type is Q235. According to note 1 in table 3.5.1 of Standard for design of steel structures and table 1 of Standard for design of steel structures. Commentary 2.2, the steel grade correction coefficient is $\varepsilon_k = 1$.

**Compressive Strength**

According to table 7.2.1-1 of steel structures code, the double angle section class is b.
The slenderness ratio of double angle on X axis, \( \lambda_x = 76.93 \). So,
\[
\frac{\lambda}{\varepsilon_k} = \lambda_y = 76.93
\]
\[
\lambda_n = \frac{\lambda_x}{n} \sqrt{\frac{I_y}{E}} = \frac{76.93}{n} \sqrt{\frac{235}{206,000}} = 0.827
\]
Class b, so, the coefficients are \( a_1 = 0.650 \), \( a_2 = 0.965 \), and \( a_3 = 0.300 \).

Since \( \lambda_n = 0.827 > 0.215 \), then the stability factor in x:
\[
\phi_x = \frac{1}{2 \times 0.827^2} \left[ (0.965 + 0.300 \times 0.827 + 0.827^2) \cdot \sqrt{(0.965 + 0.300 \times 0.827 + 0.827^2)^2 - 4 \times 0.827^2} \right] = 0.708
\]

The slenderness ratio of double angle on symmetry axis is \( \lambda_{yz} = 130.7 \). So,
\[
\frac{\lambda}{\varepsilon_k} = \lambda_x = 130.7
\]
\[
\lambda_n = \frac{\lambda_{xy}}{n} \sqrt{\frac{I_y}{E}} = \frac{130.7}{n} \sqrt{\frac{235}{206,000}} = 1.405
\]
Class b, so, the coefficients are \( a_1 = 0.650 \), \( a_2 = 0.965 \), and \( a_3 = 0.300 \).

Since \( \lambda_n = 1.405 > 0.215 \), then the stability factor in xy:
\[
\phi_{yz} = \frac{1}{2 \times 1.405^2} \left[ (0.965 + 0.300 \times 1.405 + 1.405^2) \cdot \sqrt{(0.965 + 0.300 \times 1.405 + 1.405^2)^2 - 4 \times 1.405^2} \right] = 0.384
\]

The minimum stability factor is 0.384.

**Compression Flange Width to Thickness Ratio**

From GB50017-2017 Clause 7.3.1-5, when \( \lambda = 80\varepsilon_k \) the formula 7.3.1-7 should be used to obtain the value of the width to thickness of a compression member. Here, \( \lambda_{yz} = 130.7 \) and \( \varepsilon_k = 1 \).

So, the limiting value of the width to thickness ratio = \( 5\varepsilon_k + 0.125\lambda = 5 + 0.125 \times 130.7 = 21.34 \).

According to Clause 7.3.2 of GB50017-2017,
\[
\phi Ax = 0.384 \times 1,193 \times 215 = 98,494
\]
\[
N = 92,061 < \phi Ax , \text{ so the magnification factor } a = \sqrt{\frac{98,494}{92,061}} = 1.034
\]

Therefore, Limit value of width to thickness ratio should be \( 1.034 \times 21.34 = 22.07 \).

The width per formula 7.3.1-7 of GB50017-2017, \( w = b - 2t = 100 - 2 \times 6 = 88 \text{ mm} \).

The actual width to thickness ratio is \( \frac{88}{6} = 14.67 < 22.07 \)

So the ratio is \( \frac{14.67}{22.07} = 0.66 \).

Since the section is a equal leg angle, the check for the height to thickness ratio is the same; therefore ok.
Stability of Compression Member

According to formula 7.6.1-2 of GB50017-2017,
\[ \eta = 0.6 + 0.0015\lambda = 0.6 + 0.0015 \times 130.7 = 0.796 \]

The reduction factor of stability bearing capacity, \( \rho_e \), must be calculated as
\[ \frac{w}{T} = 14.67 > 14\varepsilon_k = 14. \]

\[ \rho_e = 1.3 \cdot \frac{0.3w}{14\varepsilon_k} = 1.3 \cdot \frac{0.3 \times 88}{14 \times 6 \times 1} = 0.986 \]

The member capacity according to formula 7.6.1-1 of GB50017-2017:
\[ \rho_e \eta \phi A_f = 0.986 \times 0.796 \times 0.384 \times 1.193 \times 215 \times 10^{-3} = 77.30 \text{ kN} \]

So the ratio is \[ \frac{92.06}{77.30} = 1.19 > 1.0; \text{ Failed.} \]

V. GB500017-2017 Tube section with Combined Axial and Bending

Verify the strength, stability, and slenderness of a tube section subject to combined axial and bending per GB50017-2017.

Reference

Problem
The section is a TUB 300x10.0 with a length of 4 m. The structure is a portal frame. Member #1 assigned with a tube section (TUB300x10.0) is designed per GB 50017-2017. The section has an unbraced length of 4 m in either direction. The governing load case #1 has the following ultimate loads on the member:

\[
\begin{align*}
F_x & = 30.55 \text{ kN} \\
F_y & = 25.06 \text{ kN} \\
N & = 66.69 \text{ kN} \\
M_x & = 83.44 \text{ kN m} \quad \text{(at member end)} \\
M_y & = 122.2 \text{ kN m} \quad \text{(at member end)}
\end{align*}
\]
The material is Q235 type steel.

Design strength in tension, compression, and flexure: \( f_y = 215 \text{ MPa} \)
Design strength in shear: \( f_v = 125 \text{ MPa} \)

Calculations
Section Properties

Section depth, \( H = 300 \text{ mm} \)
Section width, \( D = 300 \text{ mm} \)
Wall thickness, \( t = 10 \text{ mm} \)
Cross-sectional area, \( A = 11,260 \text{ mm}^2 \)
Moment of inertia about \( x \), \( I_x = I_y = 155,200,00 \text{ mm}^4 \)
Radius of gyration about \( x \), \( r_x = r_y = 118.2 \text{ mm} \)
Section modulus about \( x \), \( W_x = W_y = 1,035,000 \text{ mm}^3 \)

Slenderness Ratio

The effective length is:

\[
\ell_{0x} = \mu_x \ell_x = 1.402 \times 4,000 \text{ mm} = 5,188 \text{ mm}
\]
\[
\ell_{0y} = \mu_y \ell_y = 2.0383 \times 4,000 \text{ mm} = 8,150 \text{ mm}
\]

The slenderness ratio is:

\[
\lambda_x = \frac{\ell_{0x}}{r_x} = \frac{\mu_x \ell_x}{r_x} = \frac{1.402 \times 4,000}{117.4} = 47.77 < 150
\]
\[
\lambda_y = \frac{\ell_{0y}}{r_y} = \frac{\mu_y \ell_y}{r_y} = \frac{2.038 \times 4,000}{117.4} = 69.44 < 150
\]

According to table 7.4.6 of Standard for design of steel structures, the allowable slenderness ratio of compression members is \( \lambda_{clim} = 150 \).

Ratio: \( \lambda_{\text{max}} / \lambda_{\text{clim}} = 69.44 / 150 = 0.46 \)

According to table 7.4.7 of Standard for design of steel structures, the allowable slenderness ratio of tension members is \( \lambda_{\text{lim}} = 300 \).

Ratio: \( \lambda_{\text{max}} / \lambda_{\text{lim}} = 69.44 / 300 = 0.23 \)

Steel Grade Correction Factor

The steel type is Q235. According to note 1 in table 3.5.1 of Standard for design of steel structures and table 1 of Standard for design of steel structures. Commentary 2.2, the steel grade correction coefficient is \( \varepsilon_k = 1 \).

Check Flange Width to Thickness Ratio of Compression Member

\[
\frac{B \cdot 2t}{t} = \frac{300 \cdot 2 \times 10}{10} = 28
\]

According to table 3.5.1, note 2 of Standard for design of steel structures, and the width thickness ratio of cross-section plate is grade S3, so the limit value of height thickness ratio is:

\( 40 \varepsilon_k = 40 \)

Ratio: \( \frac{28}{40} = 0.70 \)
Note: Since the section is a square tube, the web height to flange thickness check is the same.

Plastic Development Coefficient
According to clause 8.1.1 of Standard for design of steel structures, and the width thickness ratio of cross-section plate is grade S3,
\[ \gamma_x = 1.05 \]
\[ \gamma_y = 1.05 \]

Check Member Strength
According to clause 8.1.1 of Standard for design of steel structures,
\[ \sigma = \frac{N}{A} + \frac{M_x}{\gamma_x W_{nx}} + \frac{M_y}{\gamma_y W_{ny}} = \frac{N}{A} + \frac{M_x}{\gamma_x W_x} + \frac{M_y}{\gamma_y W_y} = 66.69 \times 10^3 \quad + \quad \frac{11,260}{1.05 \times 1,034,600} + \frac{83.44 \times 10^6}{1.05 \times 1,034,600} = 195.2 \text{ N/mm}^2 \]
Ratio: \[ \frac{\sigma}{f} = \frac{195.2}{215} = 0.91 \]

Check In-Plane Stability of Member
According to table 7.2.1-1 of Standard for design of steel structures, the section is “b” for this section.
According to the formula (D.0.5) in Appendix D of Standard for design of steel structures, for the x-x direction:
\[ \lambda_n = \frac{\lambda_x}{\pi} \sqrt{\frac{f}{E}} = \frac{47.77}{\pi} \sqrt{\frac{235}{206,000}} = 0.514 \]
Class b, so, the coefficients are \( \alpha_1 = 0.650 \), \( \alpha_2 = 0.965 \), and \( \alpha_3 = 0.300 \).
Since \( \lambda_n = 0.514 > 0.215 \), then the stability factor in x:
\[ \phi_x = \frac{1}{2 \lambda_n} \left[ (\alpha_2 + \alpha_3 \lambda_n + \lambda_n^2) \cdot \sqrt{(\alpha_2 + \alpha_3 \lambda_n + \lambda_n^2)^2 - 4 \lambda_n^2} \right] \]
\[ = \frac{1}{2 \times 0.514^2} \left[ (0.965 + 0.300 \times 0.514 + 0.514^2) \cdot \sqrt{(0.965 + 0.300 \times 0.514 + 0.514^2)^2 - 4 \times 0.514^2} \right] = 0.866 \]

According to the formula 8.2.1-8 of Standard for design of steel structures,
\[ N_{cr} = \frac{n^2 EI}{(\mu_d)^2} = \frac{n^2 EI_x}{(\mu_x)^2} \]
\[ = \frac{n^2 \times 206,000 \times 155,190,000}{(1.402)^2 \times 4,000} = 10,033 \text{ kN} \]

According to the formula 8.2.1-10 of Standard for design of steel structures,
\[ \beta_{mx} = 1 - 0.36 \frac{N}{N_{cr}} = 1 - 0.36 \times 66.69 / (10,033) = 0.998 \]

According to the formula 8.2.1-12 and 8.2.1-5 note of Standard for design of steel structures,
\[ \beta_{ty} = 0.65 + 0.35 \times \frac{6,000}{122,200,000} = 0.65 \]

According to the formula 8.2.1-12 of Standard for design of steel structures,
\[
N'_{Ex} = \frac{n^2EA}{1.1x} = \frac{n^2 \times 206,000 \times 11,260}{1.1 \times (47.77)^2} = 9,121 \text{ kN}
\]

According to the formula 8.2.5, \( \phi_{by} = 1.0 \).

According to the formula 8.2.1, \( \eta = 0.7 \).

According to the formula 8.2.5-1,

\[
\frac{N}{\phi_{x} A f} + \frac{\beta_{mx} M_{x}}{y_{x} W_{x} (1 - 0.8 \frac{N}{N'_{Ex}} f)} + \eta \frac{\beta_{ty} M_{y}}{\phi_{by} y_{y} f} = 66.69 \times 10^3 + \frac{0.998 \times 83.44 \times 10^6}{1.05 \times 1,034,600} + 0.7 \frac{0.65 \times 122.2 \times 10^6}{1.0 \times 1,034,600} = 0.64
\]

Check Out-of-Plane Stability of Member According to table 7.2.1-1 of Standard for design of steel structures, the section is "b" for this section.

According to the formula (D.0.5) in Appendix D of Standard for design of steel structures, for the y-y direction:

\[
\lambda_{n} = \frac{\lambda_{y}}{n} \sqrt{\frac{E}{f}} = \frac{69.44}{n} \sqrt{\frac{235}{206,000}} = 0.747
\]

Class b, so, the coefficients are \( \alpha_1 = 0.650 \), \( \alpha_2 = 0.965 \), and \( \alpha_3 = 0.300 \).

Since \( \lambda_{n} = 0.747 > 0.215 \), then the stability factor in x:

\[
\phi_{x} = \frac{1}{2 \lambda_{n}^{2}} \left[ \left( \alpha_2 + \alpha_3 \lambda_{n} + \lambda_{n}^2 \right) \cdot \sqrt{\left( \alpha_2 + \alpha_3 \lambda_{n} + \lambda_{n}^2 \right)^2 - 4 \alpha_{2} \lambda_{n}^2} \right]
\]

\[
= \frac{1}{2 \times 0.747^2} \left[ (0.965 + 0.300 \times 0.747 + 0.747^2) \cdot \sqrt{(0.965 + 0.300 \times 0.747 + 0.747^2)^2 - 4 \times 0.747^2} \right] = 0.754
\]

According to the formula 8.2.1-8 of Standard for design of steel structures,

\[
N_{cr} = \frac{n^2EI}{(\mu l)^2} = \frac{n^2EI_{y}}{(\mu y l)^2} = \frac{n^2 \times 206,000 \times 155,190,000}{(2.038 \times 4,000)^2} = 4,748 \text{ kN}
\]

According to the formula 8.2.1-10 of Standard for design of steel structures,

\[
\beta_{my} = 1 - 0.36 N / N_{cr} = 1 - 0.36 \times 66.69 / 4,748 = 0.995
\]

According to the formula 8.2.1-12 and 8.2.1-5 note of Standard for design of steel structures,

\[
\beta_{tx} = 1.0
\]

According to the formula 8.2.1-12 of Standard for design of steel structures,

\[
N'_{Ey} = \frac{n^2EA}{1.1x^2} = \frac{n^2 \times 206,000 \times 11,260}{1.1 \times (69.44)^2} = 4,316 \text{ kN}
\]

According to the formula 8.2.5, \( \phi_{bx} = 1.0 \).

According to the formula 8.2.1, \( \eta = 0.7 \).
According to the formula 8.2.5-2,
\[
\frac{N}{\phi_x A_f} + \eta \frac{\beta_{ix} M_x}{\phi_{bx} W_x f} + \frac{\beta_{my} M_y}{\gamma_y W_y \left(1 - 0.8 \frac{N}{N_{Ey}}\right) f} + \frac{0.754 \times 11,260}{0.754 \times 11,260 \times 215} = 0.83
\]

Shear Strength

Take the neutral axis as the calculation point of shear stress, calculate the area moment:
\[
S = 417,605 \text{ mm}^3
\]

According to clause 6.1.3 of the Standard for design of steel structures, shear stress
\[
\tau_x = \frac{VS}{T_{iw} x} = \frac{VS_x}{T_{iw} x (2t)} = \frac{30.55 \times 10^3 \times 631,000}{155,190,000 \times 2 \times 10} = 6.21 \text{ N/mm}^2
\]
\[
\tau_y = \frac{VS}{T_{iw} y} = \frac{VS_y}{T_{iw} y (2t)} = \frac{25.06 \times 10^3 \times 631,000}{155,190,000 \times 2 \times 10} = 5.09 \text{ N/mm}^2
\]
\[
\tau_{\text{max}} = 7.69 < f_v = 125 \text{ N/mm}^2
\]

Therefore, the ratio is:
\[
\frac{\tau_{\text{max}}}{f_v} = \frac{6.21}{125} = 0.05
\]

V. Europe

V. EC3 - Pinned column using non-slender UKC section

Verify the design of a pinned column per the EC3 2005 design code.

Details

The column is 8 m with pinned ends. The member is a 305 x 305 x 97 UKC shape with S275 grade steel. The axial load is 2,000 kN and $L_{cry}/L = 0.7$.

Partial safety factors:

$\Gamma_{M0} = 1.0$

$\Gamma_{M1} = 1.0$

Validation

Effective Length Calculations

$L_{cry} = 0.7 \times 8,000 = 5,600$ mm
L_{crz} = 1.0 \times 8,000 = 8,000 \text{ mm}

**Yield Strength**

Steel grade S275

The maximum thickness = 15.4 \text{ mm} < 40 \text{ mm}; therefore \( f_y = 275 \text{ N/mm}^2 \) [EN 1993-1-1:2005 Table 3.1]

**Section Classification**

\[ \varepsilon = \sqrt{\frac{235}{fy}} = 0.92 \]  
[EN 1993-1-1:2005 Table 5.2]

Outstanding flange (flange under uniform compression):

\[ c = \frac{(b-t_w-2r)}{2} = \frac{(305.3 - 9.9 - 2 \times 15.2)}{2} = 132.3 \text{ mm} \]

\[ \frac{c}{t} = 132.3 / 15.4 = 8.6 < 10 \varepsilon \]

Class 2 element [EN 1993-1-1:2005 Table 5.2 Sheet 2]

Internal compression part (web in bending):

\[ c = h-2t_w-2r = 307.9 - 2 \times 15.4 = 246.7 \text{ mm} \]

\[ \frac{c}{t_w} = 246.7 / 9.9 = 24.92 < 33 \varepsilon \]

Class 1 element [EN 1993-1-1:2005 Table 5.2 Sheet 1]

Therefore, section is a Class 2 section.

**Axial Resistance**

Design axial resistance:

\[ N_{c,Rd} = A \times \frac{f_y}{\Gamma_m} = 123.4 \text{ cm}^2(10^2) \times 275 \text{ kN/mm}^2 / 1.0 \times 10^{-3} = 2,283 \text{ kN} > 2,000 \text{ kN} \]  
[EN 1993-1-1:2005 Cl. 6.2.4]

**Lateral Buckling**

Determine the elastic critical moment, \( M_{cr} \):

\[ N_{b,Rd} = \chi \frac{x A f_y}{T_{M1}} \]  
[EN 1993-1-1:2005 Cl. 6.3.1.1]

\[ N_{cr} = \left( \frac{\pi^2 E I_y}{L_y^2} \right) = \left( \frac{\pi^2 \times 205,000 \times 7,308(10^4)}{(56,002 \times 1,000)} \right) = 4715 \text{ kN} \]

\[ \lambda = \left( \frac{A \times f_y}{N_{cr}} \right)^{0.5} = (123 \times 10^2 \times 275 / 4,715 \times 10^3)^{0.5} = 0.847 \]

\[ h/b = 307.9 / 305.3 = 1 < 1.2 \text{ & } t_{f} < 100 \text{ mm} \]

\[ \alpha = 0.49 \]  
[EN 1993-1-1:2005 Table 6.3]

\[ \phi = 0.5 \left[ 1 + \alpha (\lambda - 0.2) + \lambda^2 \right] \]  
[EN 1993-1-1:2005 Cl. 6.3.2.3]

\[ \phi = 0.5 \left[ 1 + 0.49(0.847 - 0.2) + 0.847^2 \right] = 1.017 \]

\[ X = \frac{1}{\phi + \sqrt{1-\phi^2}} = \frac{1}{1.017 + \sqrt{1-1.017^2 \cdot 0.847^2}} = 0.639 < 1.0 \]

\[ N_{b,Rd} = \frac{0.639 \times 123 \times 10^2 \times 275 \times 10^{-3}}{1.0} = 2,161 \text{ kN} \]

**Critical Ratio**

\[ P / N_{b,Rd} = 2,000 / 2,161 = 0.925 \]

V. EC3 - Pipe Section with Conc Load

Verify the adequacy of a circular hollow section used as a beam subject to concentrated loads per EN 1993-1-1:2005 (no national annex used).

Details

The member is a 6 m long beam with pinned ends. The beam supports 10kN concentrated loads at the third points. The steel is grade S275. The section is a European 114.3X8CHS.

Section Properties

\[ A = 26.7 \text{ cm}^2 \]
\[ \text{Outer diameter} = 114.3 \text{ mm} \]
\[ t = 8 \text{ mm} \]
\[ I_z = I_y = 379 \text{ cm}^4 \]
\[ Z_z = Z_y = 90.6 \text{ cm}^3 \]
\[ C_w = 0 \text{ cm}^6 \]
\[ r_z = r_y = \frac{I}{A} = \sqrt{\frac{379}{26.7}} = 3.768 \text{ cm} \]

Partial safety factors:

\[ \Gamma_{M0} = 1.0 \]
\[ \Gamma_{M1} = 1.0 \]
\[ \Gamma_{M2} = 1.25 \]

Validation

Section Classification

\[ \varepsilon = \sqrt{\frac{235}{f_y}} = \sqrt{\frac{235}{275}} = 0.924 \]

As per Table 5.2:

\[ \frac{d}{t} = \frac{114.3}{8} = 14.3 < 50 \times \varepsilon^2 = 50 (0.924)^2 = 42.7 \]

Hence, this is a Class 1 section.

Slenderness Ratio

The slenderness ratio = \( kL / r = 1 \times 6,000 / 37.68 = 159.3 \)

Axial Tension

Determine axial tension capacity per Cl. 6.2.3.

\[ N_{pl,Rd} = A_g \times f_y / \gamma_{M0} = 2.670 \times 275 / 1.0 \times (10)^{-3} = 734.3 \text{ kN} \]
The tensile capacity is the minimum of \( N_{pl,Rd} \) and \( N_{u,Rd} \), thus:
\[
N_{u,Rd} = 0.9 \times 2,670 \times 295 / (1.25 \times (10)^3) = 567.1 \text{ kN}
\]

No axial tension in section, so by observation no need to check ratio.

**Axial Compression**

Determine axial compression capacity per Cl. 6.2.4 for a Class 1 section.
\[
N_{c,Rd} = A_g \times f_y / \gamma_M = 2,670 \times 275 / 1.0 \times (10)^3 = 734.3 \text{ kN}
\]

Next, check the flexural buckling resistance per Cl. 6.3.1.3:
\[
N_{b,Rd} = \chi \times A \times f_y / \gamma_M
\]

From Table 6.1: the imperfection factor, \( a = 0.21 \).
\[
\lambda = \sqrt{A \times f_y / N_{cr}} = L_{cr} / i \times \lambda_1
\]

where
\[
L_{cr} = 6,000 \text{ mm} \\
i = 37.68 \text{ mm} \\
\lambda_1 = 93.9 \times c = 93.9 \times 0.924 = 86.8 \\
\lambda = 1.834
\]
\[
\Phi = 0.5[1 + a(\lambda - 0.2) + \lambda^2] = 0.5[1 + 0.21(1.834 - 0.2) + (1.834)^2] = 2.354
\]
\[
\chi = 1 / \Phi + \sqrt{\Phi^2 - \lambda^2} = 0.2611
\]
\[
N_{b,Rd} = 0.2611 \times 2,670 \times 275 / 1.0 = 191.7 \text{ kN}
\]

The compression capacity is the minimum of \( N_{c,Rd} \) and \( N_{b,Rd} \) thus: \( N_{c,Rd} = 191.7 \text{ kN} \).

No axial compression in section, so by observation no need to check ratio.

**Bending Capacity**

Maximum bending moment in the section (center third of span): \( M_{Ed} = 20.0 \text{ kN} \cdot \text{m} \).

Check for bending capacity per Cl. 6.2.5:

For a Class 1 section:
\[
M_{c,Rd} = W_{ply} \times f_y / \gamma_M = 90.6 \times 275 / 1.0 \times (10)^3 = 24.92 \text{ kN} \cdot \text{m}
\]

Ratio per Eq. 6.12: \( M_{Ed} / M_{c,Rd} = 20.0 / 24.92 = 0.803 \)

**Shear Capacity**

Maximum shear in the section: \( V_{Ed} = 10 \text{ kN} \)
\[
A_v = 2A / \pi = 1,700 \text{ mm}^2
\]

Check for shear capacity per Cl. 6.2.6 for plastic design (Class 1):
\[
V_{c,Rd} = V_{pl,Rd} = A_v \times \left( f_y / \sqrt{3} \right) / \gamma_M = 1,700 \times \left( \frac{275}{\sqrt{3}} \right) / 1.0 = 269.9 \text{ kN}
\]

Ratio per Eq. 6.17: \( V_{Ed} / V_{c,Rd} = 10.0 / 26.9 = 0.037 \)

**Lateral Torsional Buckling**
\[ M_{cr} = C_1 \frac{n^2EI}{(kL)^2} \left[ \sqrt{\left( \frac{k}{k_w} \right)^2 \frac{I_w}{T_w} + \frac{(kL)^2G_I}{n^2EI_z}} - \left( C_2 Z_g \right)^2 - C_2 Z_g \right] \]

where

\begin{align*}
C_1 &= 1.0 \\
C_2 &= 1.0 \\
n^2 EI_y &= 213,000 \\
\frac{(kL)^2}{k_w} &= 0 \\
\frac{(kL)^2 G_I}{n^2 EI_y} &= 2,806,000 \\
C_2 Z_g &= 1.0 \times 114.3 / 2 = 57.15
\end{align*}

Therefore, \( M_{cr} = 1.0 \times 213,000 \left[ \sqrt{0 + 2,806,000 + 57.15^2 - 57.15} \right] = 344.8 \, \text{kN} \cdot \text{m} \)

For CHS sections, \( \chi_{LT} = 1.0 \).

\[ M_{b,Rd} = \chi_{LT} W_y f_y / \gamma \] \[
= 1.0 \times 90.6 \times 275 / 1.0 \times (10)^3 = 24.92 \, \text{kN} \cdot \text{m}
\]

Ratio per Eq. 6.12: \( M_{Ed} / M_{b,Rd} = 20.0 / 24.92 = 0.803 \)

4
CRITICAL LOADS FOR EACH CLAUSE CHECK (units- kN,m):

STAAD.Pro 4022 User Manual
V. EC3 - Simply supported laterally unrestrained beam

Verify the design of a pinned column per the EC3 2005 design code.

Details

The beam is a 5.7 m simply supported span. The member is a UKB 356 x171 x51 shape with S275 grade steel. The member is uniformly loaded with 9.58 kN/m dead load and 6.25 kN/m live load.

Partial safety factors:

\[ \Gamma_{M0} = 1.0 \]
\[ \Gamma_{M1} = 1.0 \]

Validation

Factored Loads

\[ w = 1.35 (9.58) + 1.5 (6.25) = 22.31 \text{ kN/m} \]
\[ M_{z,Ed} = 22.31 (5.7)^2 / 8 = 90.6 \text{ kN·m} \]
\[ V_{z,Ed} = 22.31 (5.7)/2 = 63.58 \text{ kN} \]

Yield Strength

Steel grade S275

The maximum thickness = 15.4 mm < 40 mm; therefore \( f_y = 275 \text{ N/mm}^2 \) [EN 1993-1-1:2005 Table 3.1]

Section Classification

\[ \varepsilon = \sqrt{(235/f_y)} = 0.92 \] \hspace{1cm} [EN 1993-1-1:2005 Table 5.2]

Outstanding flange (flange under uniform compression):

\[ c = (b-t_w-2r)/2 = (171.5 - 7.4 - 2 \times 10.2)/2 = 71.85 \text{ mm} \]
\[ c / t_f = 71.85 / 11.5 = 6.25 < 9 \varepsilon \]

Class 1 element [EN 1993-1-1:2005 Table 5.2 Sheet 2]

Internal compression part (web in bending):

\[ c = h-2t_f-2r = 355-2 \times 11.5 - 2 \times 10.2 = 311.6 \text{ mm} \]
\[ c / t_w = 311.6 / 7.4 = 42.1 < 72 \varepsilon \]

Class 1 element [EN 1993-1-1:2005 Table 5.2 Sheet 1]

Therefore, section is a Class 2 section.

Moment Resistance
Design bending resistance:

\[ M_{c, Rd} = W_{pl} \times \frac{f_y}{\Gamma_{m0}} = 896 \text{ cm}^3 (10^3) \times 275 \text{ kN/mm}^2 / 1.0 \times 10^6 = \] 

[EN 1993-1-1:2005 Cl. 6.2.4]

246.4 kN m > 90.6 kN m

Ratio \(90.6 / 246.4 = 0.368\)

Lateral Torsional Buckling

Determine the elastic critical moment, \(M_{cr}\):

\[ M_{cr} = C_1 \pi^2 E I_y (k \lambda L_T)^2 \left\{ \frac{(k_{lw})^2 G I_t}{\pi^2 E I_y} + (C_2 z_g)^2 \right\} \] 

where

\[ k = kw = 1 \]

\[ z_g = h/2 = 177.5 \text{ mm} \]

\[ C1 = 1.132 \ [EN 1993-1-1:2005 Table F.1.2] \]

\[ C2 = 0.459 \ [EN 1993-1-1:2005 Table F.1.2] \]

\[ M_{cr} = 121.74 \text{ kN m} \]

\[ \lambda_{LT} = \sqrt{\frac{W_{pl,z} \times f_y}{M_{cr}}} = \sqrt{\frac{896,000 \times 275}{121.74(10)^6}} = 1.423 \]

\[ h/b = 355 / 171.5 = 2.07 > 2 \]

Use buckling curve c. [EN 1993-1-1:2005 Cl. 6.3.2.3 & Table 6.5]

\[ \alpha_{LT} = 0.49 \ [EN 1993-1-1:2005 Table 6.3] \]

\[ \phi = 0.5 [1 + \alpha (\lambda_{LT} - \lambda_{LT0}) + 6\lambda^2] \]

[EN 1993-1-1:2005 Cl. 6.3.2.3]

\[ \phi = 0.5 [1 + 0.49(1.423 - 0.4) + 0.75\times 1.423^2] = 1.510 \]

\[ X_{LT} = \frac{1}{\varphi_{LT} + \sqrt{(\varphi_{LT}^2 - \lambda_{LT}^2)^2}} = \frac{1}{1.510 + \sqrt{(1.510^2 - 1.423^2)}} = 0.420 < 1.0 \]

\[ X_{LT} = 0.420 < 0.494 \text{OK} \]

\[ f = 1.0 \cdot 0.5 \cdot (1 - \kappa c) [1 - 2(\lambda_{LT} - 0.8)^2] = 0.99 < 1 \]

where

\[ \kappa c = 0.94 \]

\[ X_{LT} = X_{LT} / f = 0.42 \]

\[ M_{b, Rd} = X_{LT} W_{pl,z} \times \frac{f_y}{\Gamma_{m1}} = 0.42 \times 896 \text{ cm}^3 (10^3) \times 275 \text{ kN/mm}^2 / 1.0 \times 10^6 = 103.5 \text{ kN m} > 90.6 \text{ kN m} \]

[EN 1993-1-1:2005 Cl. 6.2.4]

Ratio \(90.6 / 103.5 = 0.875\)

Check Shear Resistance

In the absence of torsion shear area

\[ A_v = A - 2bt_f + (t_w + 2r) t_f = 6490 \cdot 2 \times 171.5 \times 11.5 + (7.4 + 2 \times 10.2) \times 11 = 2,865 \text{ mm}^2 \]

\[ \eta h_w t_w = 1 \times 332 \times 7.4 = 2,457 \text{ mm}^2 > A_v \]

Shear plastic resistance

\[ V_{pl,Rd} = A_v (f_y / \sqrt{3}) / \Gamma_{M0} = 2,865 \times (275 / \sqrt{3}) / 1.0 = 454.9 \text{ kN} > 63.58 \text{ kN} \]
Ratio = $63.58 / 454.9 = 0.140$

$\frac{h}{t} = \frac{332}{7.4} = 44.86 < 66.24$ (i.e. 72 $\varepsilon$) 

[ EN 1993-1-1:2005 Cl. 6.2.6(6)]

Hence shear buckling check not required.

$V_{Ed} = 63.58 < 0.5 \times 454.9$

[ EN 1993-1-1:2005 Cl. 6.2.8(2)]

Hence combined shear and bending checks not required.

Check for Deflection Under Service Load

$G + Q = 9.58 + 6.25 = 15.83$ kN/m

\[
\delta = \frac{5 \times 15.83 \times 5 \times 700^4}{384 \times 205 \times 14 \times 135(10)^4} = 7.3 \text{ mm} < \frac{L}{300} = \frac{5 \times 700}{300} = 19 \text{ mm}
\]

*********** END OF TABULATED RESULT OF DESIGN ***********
V. EC3 - Tube Section with Axial Load

Verify the adequacy of a cantilever tube section subject to axial force and bending per EN 1993-1-1:2005 (no national annex used).

Details

The member is a 5 m long cantilever. The member is subject to a 25 kN axial compressive load along with moments of 10 kN·m about the major axis and 5 kN·m about the minor axis at the free end. The steel is grade S275. The section is a European TUB120806.

Section Properties

- $A = 23.4 \text{ cm}^2$
- Depth, $D = 120 \text{ mm}$
- Width, $B = 80 \text{ mm}$
- $t = 6.3 \text{ mm}$
- $I_x = 447 \text{ cm}^4$
- $I_y = 234 \text{ cm}^4$
- $Z_x = 91 \text{ cm}^3$
- $Z_y = 68.2 \text{ cm}^3$
- $J = 486 \text{ cm}^4$
- $C_w = 0 \text{ cm}^6$

\[
\begin{align*}
    r_z &= \sqrt{\frac{I_z}{A}} = \sqrt{\frac{447}{23.4}} = 4.371 \text{ cm} \\
    r_y &= \sqrt{\frac{I_y}{A}} = \sqrt{\frac{234}{23.4}} = 3.162 \text{ cm}
\end{align*}
\]

Partial safety factors:

- $\Gamma_{M0} = 1.0$
- $\Gamma_{M1} = 1.0$
- $\Gamma_{M2} = 1.25$

Validation

Section Classification

- $a = 1$
- $C = D - 2t = 120 - 2 \times 6.3 = 107.4 \text{ mm}$
- $\varepsilon = \sqrt{\frac{235}{f_y}} = \sqrt{\frac{235}{275}} = 0.924$

As per Table 5.2:
C / t = 107.4 / 6.3 = 17.05 < 50 \times \varepsilon

C / t = \frac{107.4}{6.3} = 17.05 < \frac{396e}{13a - 1} = 30.36

Hence, this is a Class 1 section.

**Slenderness Ratio**

The slenderness ratio = \( kL / r = 1 \times 5,000 / 31.62 = 158.1 \)

**Axial Tension**

Determine axial tension capacity per Cl. 6.2.3.

\[ N_{pl,Rd} = A_g \times f_y / \gamma M_0 = 2,340 \times 275 / 1.0 \times (10)^{-3} = 643.5 \text{ kN} \]

\[ N_{u,Rd} = 0.9 \times A_{net} \times f_u / \gamma M_2 = 0.9 \times 2,340 \times 295 / 1.25 \times (10)^{-3} = 497.0 \text{ kN} \]

The tensile capacity is the minimum of \( N_{pl,Rd} \) and \( N_{u,Rd} \), thus: \( N_{t,Rd} = 497.0 \text{ kN} \).

No axial tension in section, so by observation no need to check ratio.

**Axial Compression**

Determine axial compression capacity per Cl. 6.2.4 for a Class 1 section.

\[ N_{c,Rd} = A_g \times f_y / \gamma M_0 = 2,340 \times 275 / 1.0 \times (10)^{-3} = 643.5 \text{ kN} \]

Next, check the flexural buckling resistance per Cl. 6.3.1.3:

\[ N_{b,Rd} = \chi \times A \times f_y / \gamma M_1 \]

From Table 6.1: the imperfection factor, \( \alpha = 0.21 \).

Along the Z axis:

\[ \lambda_z = \sqrt{A \times f_y / N_{cr}} = L_{cr} / i_z \times \lambda_1 \]

where

\[ L_{cr} = 5,000 \text{ mm} \]

\[ i_z = 43.71 \text{ mm} \]

\[ \lambda_1 = 93.9 \times \varepsilon = 93.9 \times 0.924 = 86.8 \]

\[ \lambda_z = 1.318 \]

\[ \Phi = 0.5 [1 + a (\lambda_z \cdot 0.2) + \lambda_z^2] = 0.5 \left[ 1 + 0.21 (1.318 \cdot 0.2) + (1.318)^2 \right] = 1.486 \]

\[ \chi_z = \frac{1}{\Phi + \sqrt{\Phi^2 - \lambda_z^2}} = 0.4605 \]

\[ N_{b,Rd} = 0.4605 \times 2,340 \times 275 / 1.0 = 296.3 \text{ kN} \]

Along the Y axis:

\[ \lambda_y = \sqrt{A \times f_y / N_{cr}} = L_{cr} / i_y \times \lambda_1 \]

where

\[ i_y = 31.62 \text{ mm} \]

\[ \lambda_z = 1.822 \]

\[ \Phi = 0.5 [1 + a (\lambda_y \cdot 0.2) + \lambda_y^2] = 0.5 \left[ 1 + 0.21 (1.822 \cdot 0.2) + (1.822)^2 \right] = 2.330 \]
\[ X_y = \frac{1}{\Phi + \sqrt{\Phi^2 \cdot \lambda}} = 0.2644 \]

\[ N_{b,Rd} = 0.2644 \times 2,340 \times 275 / 1.0 = 170.2 \text{ kN} \]

The compression capacity is the minimum of \( N_{c,Rd} \) and \( N_{b,Rd} \), thus: \( N_{c,Rd} = 170.2 \text{ kN} \).

Ratio per Eq. 6.9: \( M_{Ed} / M_{c,Rd} = 25.0 / 170.2 = 0.147 \)

**Bending Capacity**

Along Z axis:

Maximum bending moment in the section: \( M_{Ed,z} = 10.0 \text{ kN m} \).

Check for bending capacity per Cl. 6.2.5:

For a Class 1 section:

\[ M_{c,Rd} = W_{\text{ply}} \times f_y / \gamma_{M0} = 91 \times 275 / 1.0 \times (10)^{-3} = 25.03 \text{ kN m} \]

Ratio per Eq. 6.12: \( M_{Ed} / M_{c,Rd} = 10.0 / 25.03 = 0.400 \)

Along Y axis:

Maximum bending moment in the section: \( M_{Ed,y} = 5.0 \text{ kN m} \).

Check for bending capacity per Cl. 6.2.5:

For a Class 1 section:

\[ M_{c,Rd} = W_{\text{ply}} \times f_y / \gamma_{M0} = 68.2 \times 275 / 1.0 \times (10)^{-3} = 18.76 \text{ kN m} \]

Ratio per Eq. 6.12: \( M_{Ed} / M_{c,Rd} = 5.0 / 18.76 = 0.267 \)

**Shear Capacity**

Along Z direction:

\[ A_v = A \times B / (D + B) = 2.340 \times 80 \times 120 / (120 + 80) = 936 \text{ mm}^2 \]

Check for shear capacity per Cl. 6.2.6 for plastic design (Class 1):

\[ V_{c,Rd} = V_{pl,Rd} = A_v \times (f_y / \sqrt{3}) / \gamma_{M0} = 936 \times \left( \frac{275}{\sqrt{3}} \right) / 1.0 = 148.6 \text{ kN} \]

Along Y direction:

\[ A_v = A \times D / (D + B) = 2.340 \times 120 \times 80 / (120 + 80) = 1,404 \text{ mm}^2 \]

Check for shear capacity per Cl. 6.2.6 for plastic design (Class 1):

\[ V_{c,Rd} = V_{pl,Rd} = A_v \times (f_y / \sqrt{3}) / \gamma_{M0} = 1,404 \times \left( \frac{275}{\sqrt{3}} \right) / 1.0 = 222.9 \text{ kN} \]

No shear in section, so by observation no need to check ratio.

**Lateral Torsional Buckling**

\[ M_{cr} = C_1 \frac{\pi^2 EI}{kL} \left[ I \left( \frac{k}{L} \right) + \frac{6G_t I_t}{kL} \right] - C_2 Z_g^2 - C_2 Z_g \]

where
\( C_1 = 1.0 \)
\( C_2 = 1.0 \)
\( n^2 EI_y = 189,400 \)
\( (kL)^2 = 0 \)
\( (kL)^2 G I_T = 2,023,000 \)
\( C_2 Z_g = 1.0 \times 40 = 40 \)

Therefore, \( M_{cr} = 1.0 \times 189,400 \left[ \sqrt{0 + 2,023,000} + 40^2 \right] = 261.8 \text{ kN m} \)

As per Cl. 6.3.2.1, tube sections are not susceptible to lateral-torsional buckling, so \( \chi_{LT} = 1.0 \).

\( M_{b,Rd} = \chi_{LT} W_y f_y / \gamma M_1 = 1.0 \times 91 \times 275 / 1.0 \times (10)^{-3} = 25.03 \text{ kN m} \)

Ratio per Eq. 6.12: \( M_{Ed} / M_{b,Rd} = 10.0 / 24.92 = 0.400 \)

Check for Interaction

From Table B.3 in Annex B of EC3:

\( \Psi = 1.0 \)
\( C_{my} = C_{mz} = C_{mLT} = 0.6 + 0.4 \times \Psi = 1.0 \)
\( N_{RK} = A \times f_y = 643.5 \text{ kN} \)

From Table B.1 of Annex B, the interaction factors:

\( K_{zz} = C_{mz} \left[ 1 + (\lambda_z - 0.2) N_{Ed} / x_z N_{Rk} \gamma M_1 \right] = 1.0 \left[ 1 + (1.318 - 0.2) 25 / 0.4605 \times 643.5 \right] = 1.094 \)

\( K_{zz} = 1.067 \)

\( K_{yy} = C_{my} \left[ 1 + (\lambda_y - 0.2) N_{Ed} / x_y N_{Rk} \gamma M_1 \right] = 1.0 \left[ 1 + (1.822 - 0.2) 25 / 0.2644 \times 643.5 \right] = 1.238 \)

\( K_{yy} = 1.118 \)

\( K_{yz} = 0.6 \times K_{zz} = 0.641 \)

\( K_{zy} = 0.6 \times K_{yy} = 0.671 \)

For \( K_{yz} \), consider Table B.2 as well:

\( K_{yz} = 1 \cdot \frac{0.1}{{mLT} \cdot 0.25} \frac{N_{Ed}}{x_y N_{Rk} \gamma M_1} = 0.964 < 1 \cdot \frac{0.1}{{mLT} \cdot 0.25} \frac{N_{Ed}}{x_y N_{Rk} \gamma M_1} = 0.980 \)

So, \( K_{yz} = 0.980 \)

Check for Clause 6.3.3-661:

\( \frac{N_{Ed}}{N_{Rk}} + K_{zz} \frac{M_{z,Ed}}{M_{z,Rk}} + K_{xy} \frac{M_{y,Ed}}{M_{y,Rk}} = \frac{25}{0.4605 \times 643.5} + 1.067 \frac{10}{1.0 \times 25.03} + 0.671 \frac{5}{18.76} = 0.690 \)

Check for Clause 6.3.3-662:

## STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 - Tube Section with Axial Load.std` is typically installed with the program.

The following design parameters are used:

- Fixed end supports: CMM 2
- Cantilever member: CMN 0.7
- Use Cl. 6.3.2.2 to determine $\chi_{LT}$: MTH 1
- The values of $C_1 = 1$ and $C_2 = 1$ are specified.
- The values of $F_y$ and $F_u$ are specified directly using PY 275000 and FU 295000.

Compression buckling curves: z-z: Curve a y-y: Curve a
```
V. EC3 - Tube Section with UDL

Verify the adequacy of a tube section used as a beam subject to a uniform load per EN 1993-1-1:2005 (no national annex used).

Details
The member is a 5 m long beam with fixed ends. The member is subject to a 10 kN/m uniform load. The steel is grade S275. The section is a European TUB1201205.

Section Properties

\[ A = 22.9 \text{ cm}^2 \]
Depth, \( D = 120 \text{ mm} \)
Width, \( B = 120 \text{ mm} \)
\( t = 5 \text{ mm} \)
\( I_z = I_y = 503 \text{ cm}^4 \)
\( Z_z = Z_y = 97.6 \text{ cm}^3 \)
\( C_w = 0 \text{ cm}^6 \)
\[ r_z = r_y = \sqrt{\frac{I_y}{A}} = \sqrt{\frac{503}{22.9}} = 4.687 \text{ cm} \]

Partial safety factors:

\[ \Gamma_{M0} = 1.0 \]
\[ \Gamma_{M1} = 1.0 \]
\[ \Gamma_{M2} = 1.25 \]

Validation

Section Classification

\[ \epsilon = \sqrt{\frac{235}{f_y}} = \sqrt{\frac{235}{275}} = 0.924 \]
As per Table 5.2:

\[ a = 1 \]
\[ C = D - 2 \times t = 110 \text{ mm} \]
\[ C / t = \frac{110}{5} = 22 < \frac{396 \times \varepsilon}{13a - 1} = \frac{396 \times 0.924}{12} = 30.36 \]

Hence, this is a Class 1 section.

**Slenderness Ratio**

The slenderness ratio \( kL / r = 1 \times 5,000 / 46.87 = 106.7 \)

**Axial Tension**

Determine axial tension capacity per Cl. 6.2.3.

\[ N_{pl,Rd} = A_g \times f_y / \gamma_{M0} = 2,290 \times 275 / 1.0 \times (10)^{-3} = 630.0 \text{ kN} \]

\[ N_{u,Rd} = 0.9 A_{net} \times f_u / \gamma_{M2} = 0.9 \times 2,290 \times 450 / 1.25 \times (10)^{-3} = 742.0 \text{ kN} \]

The tensile capacity is the minimum of \( N_{pl,Rd} \) and \( N_{u,Rd} \), thus: \( N_{t,Rd} = 630.0 \text{ kN} \).

No axial tension in section, so by observation no need to check ratio.

**Axial Compression**

Determine axial compression capacity per Cl. 6.2.4 for a Class 1 section.

\[ N_{c,Rd} = A_g \times f_y / \gamma_{M0} = 2,290 \times 275 / 1.0 \times (10)^{-3} = 630.0 \text{ kN} \]

Next, check the flexural buckling resistance per Cl. 6.3.1.3:

\[ N_{b,Rd} = \chi \times A \times f_y / N_{cr} = \frac{\chi \times A \times f_y}{L_{cr} / i \times \lambda_1} \]

From Table 6.1: the imperfection factor, \( a = 0.21 \).

\[ \lambda = \sqrt{A \times f_y / N_{cr}} = \frac{L_{cr}}{i \times \lambda_1} \]

where

\[ L_{cr} = 5,000 \text{ mm} \]

\[ i = 46.87 \text{ mm} \]

\[ \lambda_1 = 93.9 \times \varepsilon = 93.9 \times 0.924 = 86.8 \]

\[ \lambda = 1.229 \]

\[ \Phi = 0.5(1 + a(\lambda - 0.2) + \lambda^2) = 0.5[1 + 0.21(1.229 - 0.2) + (1.229)^2] = 1.363 \]

\[ \chi = \frac{1}{\Phi + \sqrt{\Phi^2 - \lambda^2}} = 0.512 \]

\[ N_{b,Rd} = 0.512 \times 2,290 \times 275 / 1.0 = 322.4 \text{ kN} \]

The compression capacity is the minimum of \( N_{c,Rd} \) and \( N_{b,Rd} \), thus: \( N_{c,Rd} = 322.4 \text{ kN} \).

No axial compression in section, so by observation no need to check ratio.

**Bending Capacity**

Maximum bending moment in the section (at fixed supports): \( M_{Ed} = 20.83 \text{ kN m} \).

Check for bending capacity per Cl. 6.2.5:

For a Class 1 section:

\[ M_{c,Rd} = W_{ply} \times f_y / \gamma_{M0} = 97.6 \times 275 / 1.0 \times (10)^{-3} = 26.84 \text{ kN m} \]

Ratio per Eq. 6.12: \( M_{Ed} / M_{c,Rd} = 20.83 / 26.84 = 0.776 \)
Shear Capacity

Maximum shear in the section (at fixed supports): \( V_{Ed} = 25 \text{ kN} \)

\[
A_v = \frac{A \times D}{D + B} = \frac{2,290 \times 120}{120 + 120} = 1,145 \text{ mm}^2
\]

Check for shear capacity per Cl. 6.2.6 for plastic design (Class 1):

\[
V_{c,Rd} = V_{pl,Rd} = A_v \times \left(\frac{f_y}{\sqrt{3}}\right) / \gamma_{M0} = 1,145 \times \left(\frac{275}{\sqrt{3}}\right) / 1.0 = 181.8 \text{ kN}
\]

Ratio per Eq. 6.17:

\[
\frac{V_{Ed}}{V_{c,Rd}} = \frac{25.0}{181.8} = 0.138
\]

Lateral Torsional Buckling

\[
M_{cr} = C_1 \frac{n^2EI_y}{(kL)^2} \left[ \frac{\left(\frac{k}{h_w}\right)^2 I_w}{T_z} + \frac{(kL)^2GI_t}{n^2EI_z} + (C_2Z_g)^2 - C_2Z_g \right]
\]

where

\[
\begin{align*}
C_1 &= 1.0 \\
C_2 &= 1.0 \\
n^2EI_y &= 162,800 \\
\left(\frac{k}{h_w}\right)^2 I_w &= 0 \\
\frac{(kL)^2GI_t}{n^2EI_z} &= 375,300 \\
C_2Z_g &= 1.0 \times 60 = 60
\end{align*}
\]

Therefore, \( M_{cr} = 1.0 \times 162,800 \left[ \sqrt{0 + 375,300 + 60^2} \right] = 904.6 \text{ kN} \cdot \text{m} \)

From Table 6.4, buckling curve “d” is used. From Table 6.3, \( a_{LT} = 0.76 \) for buckling curve d.

As per Cl. 6.3.2.1, tube sections are not susceptible to lateral-torsional buckling, so \( \chi_{LT} = 1.0 \).

\[
M_{b,Rd} = \chi_{LT}W_y \times f_y / \gamma_{M1} = 1.0 \times 97.6 \times 275 / 1.0 \times (10)^3 = 26.84 \text{ kN} \cdot \text{m}
\]

Ratio per Eq. 6.12:

\[
\frac{M_{Ed}}{M_{b,Rd}} = \frac{20.83}{26.84} = 0.776
\]

V. EC3 Belgian NA - Channel Section with Conc Load

Calculate the bending capacity of a channel section beam under subject to a pair of concentrated load per the Belgian NA to EC3

Details

The section is a C15X50, grade S275 steel. The member is a 6 m span, simply supported beam is subject to two concentrated loads of 10 kN each at the 1/3 points (2 m from either support).

Validation

Moment capacity:

\[ M_{chd} = \frac{W_{pl} f_y}{\gamma_{Mo}} = \frac{1.123(10)^3 275}{1.0(10)^6} = 308.7 \text{ kN m} \]

The critical moment is given by:

\[ M_{cr} = C_1 \left( \frac{n^2 EI}{k_L} \right)^2 \left[ \left( \frac{k_z}{k_w} \right)^2 + \left( \frac{k_z L}{k_w} \right)^2 G T + \frac{(C_2 Z_g - C_3 Z_j)^2}{n^2 E I_z} \right] - (C_2 Z_g - C_3 Z_j)^2 \]

where

\[
\begin{align*}
C_1 &= 1.046 \\
C_2 &= 0.42 \\
C_3 &= 1.0 \\
n^2 E I_y \quad &= 257,320 \\
(kL)^2 &
\end{align*}
\]

\[
\left( \frac{k}{k_w} \right) \frac{A^2 I_w}{I_y} = 28,852
\]

\[
\frac{(kL)^2 G I_T}{n^2 E I_y} = 315,300
\]

\[
C_2 Z_j = 0.42 \times 0.5 \times 381 = 80.01
\]

\[
\beta_f = \frac{b_c^3 + t_c}{b_c^3 + t_c + b_t^3 + t_t} = 0.5 \quad \text{(From SN030a-EN-EU)}
\]

\[
Z_j = 0.4 \times h_s (2 \times \beta_f - 1) = 0, \text{ since } \beta_f \geq 0.5
\]

\[
C_2 Z_j = 1.0 \times (0) = 0
\]

Therefore, \( M_{cr} = 1.046 \times 257,320 \left[ \sqrt{28,852 + 315,270 + (80.01)^2} - (80.01) \right] = 137.8 \text{ kN m} \)

### V. EC3 Belgian NA - Column with Axial Load

Calculate the axial and bending capacities and interaction ratios of a column using the Belgian NA to EC3.

#### Details

The 5 m tall column as a fixed base and is free to translate and rotate at the top. The column is subject to a 25 kN compressive load and moments of 5 kN·m about the X axis and 10 kN·m about the Z axis. The section is an HD320X127, grade S275 steel.

#### Validation

**Bending Capacity**

Moment capacity:

\[
M_{chk} = \frac{W_{p}bly_{y}}{\gamma_{M0}} = \frac{2.149(10)^{3}275}{1.0(10)^{8}} = 591.0 \text{ kN·m}
\]
The critical moment is given by:

\[ M_{cr} = C_1 \frac{n^2EI_y}{(kL)^2} \left( \frac{k}{k_w} \right)^2 \frac{I_w}{T_y} + \frac{(kL)^2G_{It} \pi^2}{n^2EI_y} + (C_2Z_g)^2 - C_2Z_g \]

where

\[ \begin{align*}
C_1 &= 2.578 \\
C_2 &= 1.554 \\
n^2EI_y &= 7,477,200 \\
(kL)^2 &= 22,394 \\
\left( \frac{k}{k_w} \right)^2 \frac{I_w}{T_y} &= 23,740 \\
\frac{(kL)^2G_{It} \pi^2}{n^2EI_y} &= 1.554 \times 160 = 248.6
\end{align*} \]

Therefore, \( M_{cr} = 1,540.6 \text{ kN m} \)

From the Belgian NA, \( \lambda_{LT, \theta} = 0.4, \beta = 0.75 \)

So, \( \lambda_{LT} = \frac{w_y f_y}{M_{cr}} = \sqrt{\frac{2.149 \times 10^3 \times 275}{1.5406 \times 10^6}} = 0.619 \)

\( H/b = 320/300 = 1.067 < 2 \) So, from Table 6.5 of Eurocode 3, \( a_{LT} = 0.34 \).

From Cl. 6.3.2.3 of Eurocode3:

\[ \Phi_{LT} = 0.5[1+a_{LT} (\lambda_{LT} - \lambda_{LT, \theta}) + \beta \lambda_{LT}^2] = 0.5[1 + 0.34 \times (0.619 - 0.4) + 0.75 \times 0.619^2] = 0.681 \]

So, \( \chi_{LT} = (\Phi_{LT} + \sqrt{\Phi_{LT}^2 - 2 \beta \lambda_{LT}^2})^{-1} = 0.908 \)

\[ M_B = \frac{x_{LT} w_y f_y}{y_{M1}} = \frac{0.908 \times 2.149(10)^3 \times 275}{1.0} = 536.8 \text{ kN m} \]

Compression Capacity

Critical compressive values:

\[ \begin{align*}
N_{cry} &= \sqrt{\frac{n^2EI_y}{(kL)^2}} = 7,477 \text{ kN} \\
N_{crz} &= \sqrt{\frac{n^2EI_z}{(kL)^2}} = 24,943 \text{ kN} \\
\lambda_{cy} &= \frac{A \times f_y}{N_{cry}} = 0.770 \\
\lambda_{cz} &= \frac{A \times f_y}{N_{crz}} = 0.422
\end{align*} \]

Determine \( \chi_y \)

\( h/b = 1.067 < 1.2 \) and \( t_f = 20.5 \text{ mm} < 100 \text{ mm} \)
So, for y-y axis, use curve “c”. Hence, \( \alpha = 0.49 \) [Table 6.2, EC3]

So, \( \phi = 0.5[1+\alpha (\lambda - 0.2) +\lambda^2)] = 0.936 \)

\[
X_y = \frac{1}{\phi + \sqrt{\phi^2 - \lambda^2}} \cdot 0.681 \quad \text{(governs)}
\]

Determine \( \chi_y \)

\[
h/b = 1.067 < 1.2 \quad \text{and} \quad t_f = 20.5 \text{ mm} < 100 \text{ mm}
\]

So, for z-z axis, use curve “b”. Hence, \( \alpha = 0.34 \) [Table 6.2, EC3]

So, \( \phi = 0.5[1+\alpha (\lambda - 0.2) +\lambda^2)] = 0.627 \)

\[
\chi_z = \frac{1}{\phi + \sqrt{\phi^2 - \lambda^2}} \cdot 0.917 \quad \text{(does not govern)}
\]

Compression capacity:

\[
X_y \times N_{Rk} = 0.681 \times 7,477 = 3,020.2 \text{ kN}
\]

Compression ratio:

\[
\frac{25 \text{ kN}}{3,020.2 \text{ kN}} = 0.008
\]

Critical Axial Loads for Flexure and Flexural Torsional Buckling

From NCCI document SN001a-EN-FU:

\[
N_{cr,T} = \frac{1}{i_0^2} \left( G I_t + \frac{n^2 E I_w}{I_T^2} \right)
\]

where

\[
i_o^2 = i_y^2 + i_z^2 + y_o^2 + z_o^2, \text{ here } y_o = z_o = 0
\]

\[
i_y = 75.68 \text{ mm} \quad \text{and} \quad i_z = 138.23 \text{ mm}
\]

\[
i_0^2 = 24,835 \text{ mm}^2
\]

\[
N_{cr,T} = \frac{1}{24,835} \left[ \frac{20,500 \times 225.1(10)^4}{2.6} + \frac{n^2(205,000)(2.069(10)^{12})}{5,000^2} \right] = 13,889 \text{ kN}
\]

\[
N_{cr,TF} = \frac{i_0^2}{2(i_y^2 + i_z^2)} \left[ N_{cr,y} + N_{cr,T} \cdot \sqrt{(N_{cr,y} + N_{cr,T})^2 \cdot 4N_{cr,y} N_{cr,T} \cdot i_y^2 + i_z^2} \right]
\]

\[
= \frac{1}{2} \left[ 24,943 + 13,889 \cdot \sqrt{(24,943 + 13,889)^2 \cdot 4(24,943)(13,889)^{1/2}} \right] = 13,889 \text{ kN}
\]

Interaction Check

From Annex A, Table A.1 of EC3, the auxiliary terms:

\[
\mu_z = \frac{N_{Ed}}{N_{crz} \times X_z} = 0.9999
\]

---

**Verification Examples**

**V.09 Steel Design**

STAAD.Pro 4045 User Manual
\[ \mu_y = \frac{1 - Y_y}{N_y / N_{cr}} = 0.9989 \]
\[ XLT = 0.908294 \]
\[ W_z = w_{plz} / w_{elz} = 2149 / 1926 = 1.1158 \]
\[ W_y = w_{ply} / w_{ely} = 939 / 615.933 = 1.525 > 1.5, \text{ so, } w_y = 1.5 \]
\[ \psi = 1.0 \]
\[ c_{mz,0} = 0.79 + 0.21 \times 1 + 0.36(1 - 0.33) \times \frac{25}{24.942} = 1.0002 \]
Also, \( c_{mz,0} > 1 - N_{Ed} / N_{cr, z} \), OK
\[ c_{my,0} = 0.79 + 0.21 \times 1 + 0.36(1 - 0.33) \times \frac{25}{7.477} = 1.0008 \]
Also, \( c_{my,0} > 1 - N_{Ed} / N_{cr, y} \), OK

Determination of \( \lambda_0 \)

\[ C_1 = 1, C_2 = 0 \]
\[ M_{cr} = 1,606 \text{ kN} \]
\[ \lambda_0 = \sqrt{\frac{2149 \times 10^3 \times 275}{1,606 \times 10^6}} = 0.6066 \]
\[ \lambda_{0,limit} = 0.2 \sqrt{C_1 \left( 1 - \frac{N_{Ed}}{N_{cr}} \right)^{\frac{1}{2}} \left( 1 - \frac{N_{Ed}}{N_{cr, T}} \right)} = 0.321 \]
\[ \lambda_0 > \lambda_{0,limit} \]
\[ a_{LT} = 1 \times I_1 / I_z = 0.993 \]
\[ e_z = \frac{M_{Z, Ed}}{N_{Ed}} \times \frac{A}{W_{elz}} = 3.350 \]
\[ C_{mz} = C_{mz,0} + (1 - C_{mz,0}) \times \frac{\sqrt{Z \times a_{LT}}}{1 + \sqrt{Z \times a_{LT}}} = 1.000 \]
\[ C_{my} = C_{my,0} = 1.001 \]
\[ C_{m LT} = C_{mz} \times \frac{a_{LT}}{\left( 1 - \frac{N_{Ed}}{N_{cr}} \right) \times \left( 1 - \frac{N_{Ed}}{N_{cr, T}} \right)} = 0.995 < 1 \]

So, \( C_{m LT} = 1.0 \)
\[ \lambda_{max} = \text{the maximum of } \lambda_y \text{ and } \lambda_z, \text{ therefore } \lambda_{max} = \lambda_y = 0.7702 \]
\[ b_{LT} = 0.5 \alpha_{LT} \lambda_0^2 \times \frac{M_{yEd}}{M_{ply, Rd}} \times \frac{M_{zEd}}{M_{plz, Rd}} = 0.5 \times 0.993 \times 0.6066^2 \times \frac{5 \times 10}{0.908 \times 258.3 \times 591} \equiv 0 \]
\[ \eta_{pl} = \frac{N_{Ed}}{N_{Rk}} = \frac{25}{4.436/1.0} = 0.0056 \]

\[ C_{zz} = 1 + \left( w_z + 1 \right) \left[ \left( 2 - \frac{1.6}{w_z} C_{mz}^2 \right) \max + \frac{1.6}{w_z} C_{mz}^2 \right] \eta_{pl} \cdot b_{LT} \]

\[ = 1 + (1.1158 - 1) \left[ \left( 2 - \frac{1.6}{1.1158} \right)^2 \times 0.7702 - \frac{1.6}{1.1158} \right] \times 0.00564 \cdot 0.0 \approx 1.0 \]

\[ W_{elz}/W_{plz} = 0.8962 < C_{ZZ} \text{ So, } C_{ZZ} = 1.0 \]

\[ C_{LT} = 10 a_{LT} \frac{\lambda_0^2}{5 + \lambda_y^4} \times \frac{M_{z,Ed}}{C_{mz} \times x_L T \times M_{plz,Rd}} = 0.0127 \]

\[ C_{zy} = 1 + \left( w_y - 1 \right) \left[ \left( 2 - 14 \frac{C_{my}^2 \times \lambda_{max}^2}{w_y^5} \right) \eta_{pl} \cdot C_{LT} \right] = 0.9962 \]

Check \( C_{zy} > 0.6 \sqrt{\frac{W_{y}}{W_{z}} \times \frac{W_{elz}}{W_{ple}}} = 0.456, 0K \)

\[ d_{LT} = 2 a_{LT} \frac{\lambda_0}{0.1 + \lambda_y^4} \times \frac{M_{z,Ed}}{C_{mz} \times x_L T \times M_{plz,Rd}} = 0.00927 \]

\[ = 2 \times 0.9927 \times \frac{0.6066}{0.1 + 0.7702^2} \times \frac{10}{1 \times 0.9093 \times 591} \times \frac{5}{1.0008 \times 258.3} = 0.0096 \]

\[ C_{yz} = 1 + \left( w_z - 1 \right) \left[ \left( 2 - 14 \frac{C_{my}^2 \times \lambda_{max}^2}{w_y^5} \right) \eta_{pl} \cdot d_{LT} \right] = 0.9981 \]

\[ e_{LT} = 1.7 a_{LT} \frac{\lambda_0}{0.1 + \lambda_y^4} \times \frac{M_{z,Ed}}{C_{mz} \times x_L T \times M_{plz,Rd}} = 0.0422 \]

\[ C_{yy} = 1 + \left( w_y - 1 \right) \left[ \left( 2 - 14 \frac{C_{my}^2 \times \lambda_{max}^2}{w_y^5} \right) \eta_{pl} \cdot e_{LT} \right] \]

\[ = 1 + (1.5 - 1) \left[ \left( 2 - 14 \frac{1.001^2 \times 0.7702}{0.7702^5} \right) \eta_{pl} \right] = 0.9804 \]

\[ W_{elz}/W_{ple} = 0.656 < C_{yy} \text{ So, } C_{yy} = 0.9804 \]

Interaction factors:

\[ K_{zz} = C_{mz} C_{mLT} \frac{\mu_z \times 1}{N_{Ed} N_{crz}} = 1.001 \]

\[ K_{zy} = C_{my} \frac{\mu_y \times 1}{N_{Ed} N_{crz}} = 0.06 \sqrt{\frac{w_y}{w_z}} = 0.7012 \]

\[ K_{y2} = C_{mz} C_{mLT} \frac{\mu_y \times 1}{N_{Ed} N_{crz}} \sqrt{\frac{w_y}{w_z}} = 0.5185 \]

\[ R = \frac{W_{elz} / W_{plz}}{C_{ZZ}} \]
\[ K_{yy} = C_{my} \frac{\mu_y}{N_{Ed} N_{cr}} \times \frac{1}{C_{yy}} = 1.023 \]

Check for Clause 6.3.3-661:

\[
\frac{N_{Ed}}{N_{Rk}} + K_{ZZ} \frac{M_{z,Ed}}{M_{z,Rk}} + K_{xy} \frac{M_{y,Ed}}{M_{y,Rk}} = \frac{25}{0.0174 \times 4436} \times 1.001 \frac{10}{0.9983 \times 591} + 0.7012 \frac{5}{258.3} = 0.038
\]

\[
\frac{N_{Ed}}{N_{Rk}} + K_{xy} \frac{M_{z,Ed}}{M_{z,Rk}} + K_{yy} \frac{M_{y,Ed}}{M_{y,Rk}} = \frac{25}{0.6909 \times 4436} \times 0.519 \frac{10}{0.9083 \times 591} + 1.0231 \frac{5}{258.3} = 0.038
\]

- **D5.D.10 Belgian National Annex to EC3** (on page 1556)

### V. EC3 Belgian NA - I Section with Conc Load

Calculate the bending capacity of a beam subject to a concentrated load per the Belgian NA to EC3.

#### Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, simply-supported span subject to a 30 kN concentrated load at midspan.

#### Validation

**Moment capacity:**

\[
M_{ck,ld} = \frac{W_{\text{ply}} f_y}{\gamma_M} = \frac{2.149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN m}
\]

The critical moment is given by:

\[
M_{cr} = C_1 \left( \frac{2EI_y}{(kL)^2} \right) \left\{ \frac{k}{k_w} \right\}^2 \frac{I_w}{T_y} + \frac{(kL)^2 G_I}{n^2EI_y} + \left( C_2 Z_g \right)^2 \left( C_2 Z_g \right)
\]

where

\[
\begin{align*}
C_1 &= 1.35 \\
C_2 &= 0.59 \\
n^2EI_y &= 7,477,200 \\
(kL)^2 &= 22,394 \\
\left( \frac{k}{k_w} \right)^2 &= 23,737 \\
(bkL)^2 G_I &= 0.59 \times 160 = 94.4
\end{align*}
\]

Therefore, \( M_{cr} = 1,416 \text{ kN m} \)

From the Belgian NA, \( \lambda_{LT,0} = 0.4, \beta = 0.75 \)

So, \( \lambda_{LT} = \frac{w_{\text{fy}} f_y}{M_{cr}} = \sqrt{\frac{2.149 \times (10)^3 \times 275}{1,416 \times (10)^6}} = 0.646 \)

\( H/b = 320/300 = 1.067 < 2 \) So, from Table 6.5 of Eurocode 3, \( \alpha_{LT} = 0.34 \).

From Cl. 6.3.2.3 of Eurocode 3:

\[
\Phi_{LT} = 0.5[1+\alpha_{LT} (\lambda_{LT} - \lambda_{LT,0}) + 8 \times \lambda_{LT}^2] = 0.5[1 + 0.34 \times (0.646 - 0.4) + 1 \times 0.646^2] = 0.698
\]
So, $\chi_{LT} = \left(\Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta_{LT}^2}\right)^{-1} = 0.896$

From Table 6.6 of the Eurocode 3, $k_c = 0.9$

Modification factor: $f = 1.0$

$\chi_{LT,mod} = \frac{\chi_{LT}}{f} = 0.896 < \frac{1}{\lambda_{LT}^2} = 2.396$, OK

$M_B = \frac{\chi_{LT}wfy}{\gamma M_1} = \frac{0.896 \times 2.149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 529.4 \text{kN} \cdot \text{m}$

### V. EC3 Belgian NA - I Section with UDL

Calculate the bending capacity of a beam using an I section subject to a uniformly distributed load per the Belgian NA to EC3.

#### Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, fixed-fixed span subject to a 10 kN/m uniform load.

#### Validation

Moment capacity:

\[
M_{chd} = \frac{W_{pl}f_y}{\gamma_{M0}} = \frac{2.149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN} \cdot \text{m}
\]

The critical moment is given by:

\[
M_{cr} = C_1 \frac{n^2 E I}{(kL)^2} \left( \frac{k}{k_w} \frac{T}{I} + \frac{(kL)^2 G_1}{n^2 E I} + (C_2 Z_g)^2 - C_2 Z_g \right)
\]

where

\[
C_1 = 2.578
\]
\[
\begin{align*}
C_2 &= 1.554 \\
k &= 0.5 \\
n^2EI_y &= 29,909,000 \\
\frac{(kL)^2}{(k_w)^2} &= 5,599 \\
f_{w}I_y &= 5,934 \\
C_2Z_g &= 1.554 \times 160 = 248.6
\end{align*}
\]

Therefore, \( M_{cr} = 1,712 \text{ kN} \cdot \text{m} \)

From the Belgian NA, \( \lambda_{LT,0} = 0.2, \beta = 1.0 \)

So, \( H/b = 320/300 = 1.067 < 2 \). So, from Table 6.5 of Eurocode 3, \( a_{LT} = 0.34 \).

From Cl. 6.3.2.3 of Eurocode3:

\[
\Phi_{LT} = 0.5[1 + a_{LT} (\lambda_{LT} - \lambda_{LT,0}) + 8 \times \lambda_{LT}^2] = 0.5[1 + 0.34 \times (0.589 - 0.2) + 1 \times 0.588^2] = 0.739
\]

So, \( X_{LT} = \left( \Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta \lambda_{LT}^2} \right)^{-1} = 0.843 \)

From Table 6.6 of the Eurocode 3, \( k_c = 0.9 \)

Modification factor: \( f = 1 - 0.5(1 - k_c)[1 - 2(\lambda_{LT} - 0.8)^2] = 1 - 0.5(1 - 0.9)[1 - 2(0.588 - 0.8)^2] = 0.955 \)

\( X_{LT,\text{mod}} = \frac{X_{LT}}{f} = 0.883 < \frac{1}{\lambda_{LT}^2} = 2.897, \text{OK} \)

\[
M_B = \frac{X_{LT}f_wI_y}{y_{M1}} = \frac{0.883 \times 2.149}{1} \times \left( \frac{10^3}{275} \right) = 521.8 \text{ kN} \cdot \text{m}
\]

If Cl. 6.3.2.2 is used to determine \( X_{LT} \):

\( H/b = 320/300 = 1.067 < 2 \). So, from Table 6.3 of Eurocode 3, \( a_{LT} = 0.21 \).

\[
\Phi_{LT} = 0.5[1 + a_{LT} (\lambda_{LT} - 0.2) + \lambda_{LT}^2] = 0.5[1 + 0.21 \times (0.588 - 0.2) + 1 \times 0.588^2] = 0.713
\]

So, \( X_{LT} = \left( \Phi_{LT} + \sqrt{\Phi_{LT}^2 - \lambda_{LT}^2} \right)^{-1} = 0.895 \)

\[
M_B = \frac{X_{LT}f_wI_y}{y_{M1}} = \frac{0.895 \times 2.149}{1} \times \left( \frac{10^3}{275} \right) = 528.9 \text{ kN} \cdot \text{m}
\]
## Results

### STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 Belgian NA - I Section with UDL.std` is typically installed with the program.

The following [D5.C.6 Design Parameters](on page 1493) are used:

- The Belgian NA is specified using NA 8
- Fully fixed span: CMN 0.5
- Uniformly distributed load w/ fixed-fixed supports: CMM 2
- The value of $C^2$ 1.554 is specified
- The parameter KC instructs the program to calculate the value of $k_c$
- A second design parameter set is used with MTH 1 to use Cl 6.3.2.2 to determine $\Phi_{LT}$

**Note:** The previously set parameters are still used as they are not specified again with a different value, which is the default behavior in STAAD.Pro batch design.

************** END OF TABULATED RESULT OF DESIGN **************
V. EC3 Belgian NA - Tee Section

Calculate the bending capacity of a beam using an Tee section subject to a uniformly distributed load and varying end moments per the Belgian NA to EC3.

Details

The section is an Indian INST100 with $f_y = 300$ MPa. The member is a 5 m, simply-supported span under a 2 kN/m uniform load. The left support has a -5.0 kN·m moment applied and the right support has a 2.5 kN·m moment applied.

Validation

Moment capacity:
The critical moment is given by:

\[ M_{cr} = C_1 \pi^2 E I (k_z L)^2 \left( \frac{k_z I_w}{I_y} \right)^2 + \frac{(k_z L)^2 G I_T}{n^2 E I_y} + (C_2 Z_y - C_3 Z_j)^2 - (C_2 Z_y - C_3 Z_j) \]

where

\[ C_1 = 1.0 \]
\[ C_2 = 1.0 \]
\[ C_3 = 1.0 \]
\[ n^2 E I_y = 64,421 \]
\[ \frac{(k_z L)^2}{n^2 E I_y} \]
\[ 2 \left( \frac{k_z I_w}{I_y} \right)^2 = \left( \frac{1}{T} \right)^2 \frac{30.76}{79.6} = 0.386 \]
\[ \frac{(k_z L)^2 G I_T}{n^2 E I_y} = \frac{(1 \times 5,000)^2 \times 205,000 \times 7.33 \times (10)^4}{2.6 \times n^2 \times 205,000 \times 79.6 \times (10)^4} = 89,714 \]
\[ C_2 Z_y = 1.0 \times 10 / 2 = 5 \]
\[ \Psi_f = 1 (I_f = 0, \text{as there is no tension flange present in the Tee section}) \]
\[ h_s = D - 0.5 \times t = 100 - 0.5 \times 10 = 95 \text{ mm} \]
\[ z_j = 0.8 \times \Psi_f h_s / 2 = 0.8 \times 1 \times 95 / 2 = 38 \text{ mm} \]
\[ C_3 Z_j = 1.0 \times 38 = 38 \]

Therefore, \[ M_{cr} = 1.0 \times 64,421 \left[ \sqrt{0.386 + 89,714 + (5 - 38)^2 - (5 - 38)} \right] = 21.5 \text{ kN·m} \]

**STAAD.Pro Input**

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 Belgian NA - Tee Section.std` is typically installed with the program.

The following **D5.C.6 Design Parameters** (on page 1493) are used:

- The Belgian NA is specified using **NA 8**
- Simply-supported span: **CMN 1.0**
- Varying end moments and a uniformly distributed load: **CMM 7**
• The values of $C_1 \ 1.0$, $C_2 \ 1.0$, and $C_3 \ 1.0$ are specified

**Note:** Since these parameters are specified, $\mu$ is *not* specified as it would be ignored in favor of the direct coefficient specifications. Refer to D5.D.10.2 Clause 6.3.2.2 – Elastic critical moment and imperfection factors for LTB checks (on page 1557) for additional details.

**************** END OF TABULATED RESULT OF DESIGN ****************
V. EC3 Belgian NA - Varying End Moments

Calculate the bending capacity of a beam using an I section subject to a concentrated load and varying end moments per the Belgian NA to EC3.

Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, simply-supported span subject to a 10 kN/m uniform load. The left support has a -10.0 kN·m moment applied and the right support has an 8.0 kN·m moment applied.

Validation

Moment capacity:

\[ M_{ckd} = \frac{W_{pl} f_y}{y_{M0}} = \frac{2.149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN·m} \]

The critical moment is given by:

\[ M_{cr} = C_1 \left( \frac{k^2 E I}{(kL)^2} \right) \left( \frac{k^2 w I}{T w} + \frac{(kL)^2 G I_t}{n^2 E I y} + (C_2 Z_g)^2 - C_2 Z_g \right) \]

where

\[ C_1 = 2.578 \]
\[ C_2 = 1.554 \]
\[ k = 1 \]
\[ \frac{k^2 E I}{(kL)^2} = 7,477,200 \]
\[ \frac{k^2 w I}{T w} = 22,394 \]
\[ \frac{(kL)^2 G I_t}{n^2 E I y} = 23,737 \]
\[ C_2 Z_g = 0.17 \times 160 = 27.2 \]

Therefore, \( M_{cr} = 1,541 \text{ kN·m} \)

\[ \mu = \frac{FL}{4M} = \frac{4 \times 5}{4 \times 10} = 0.5 > 0 \]

From the graph, \( C_1 = 1.184, C_2 = 0.17 \)

\[ C_2 Z_g = 0.17 \times 160 = 27.2 \]

Therefore, \( M_{cr} = 1,676 \text{ kN·m} \)

- D5.D.10 Belgian National Annex to EC3 (on page 1556)

V. EC3 French NA - Channel Section with Conc Load

Calculate the bending capacity of a channel section beam under subject to a pair of concentrated load per the French NA to EC3

Details

The section is a C15X50, grade S275 steel. The member is a 6 m span, simply supported beam is subject to two concentrated loads of 10 kN each at the 1/3 points (2 m from either support).

Validation

Moment capacity:

\[ M_{ckd} = \frac{W_{pl} f_y}{\gamma_{Mo}} = \frac{1.123(10)^3275}{1.0(10)^6} = 308.7 \text{ kN m} \]

The critical moment is given by:

\[ M_{cr} = C_1 \left( \frac{n Z^2 EI_y}{(kL)^2} \right) \left[ \left( \frac{k_z}{R_w} \right) \frac{I_w}{T_z} + \frac{(k_z L)^2 G I_T}{n^2 EI_z} + \left( C_2 Z_G \cdot C_3 Z_J \right)^2 - \left( C_2 Z_G \cdot C_3 Z_J \right) \right] \]

where

- \( C_1 = 1.046 \)
- \( C_2 = 0.42 \)
- \( C_3 = 1.0 \)
- \( n^2 EI_y = 257,320 \)
- \( \frac{(kL)^2}{(k_z L)^2} \frac{I_w}{T_y} = 28,852 \)
\[
\frac{(kL)^2 G I_T}{n^2 E I_y} = 315,300
\]
\[
C_2 Z_g = 0.42 \times 0.5 \times 381 = 80.01
\]
\[
\beta_f = \frac{b_c h_c / c_c + t_c}{b_c h_c / c_c + b_t h_t / t_t} = 0.5 \text{ (From SN030a-EN-EU)}
\]
\[
Z_j = 0.4 \times h_s (2 \times \beta_f - 1) = 0, \text{ since } \beta_f \geq 0.5
\]
\[
C_3 Z_j = 1.0 (0) = 0
\]

Therefore, \( M_{cr} = 1.046 \times 257,320 \left[ \sqrt{28,852 + 315,270 + (80.01)^2} - (80.01) \right] = 137.8 \text{ kN m} \)

V. EC3 French NA - Column with Axial Load

Calculate the axial and bending capacities and interaction ratios of a column using the French NA to EC3.

Details

The 5 m tall column as a fixed base and is free to translate and rotate at the top. The column is subject to a 25 kN compressive load and moments of 5 kN·m about the X axis and 10 kN·m about the Z axis. The section is an HD320X127, grade S275 steel.

Validation

Bending Capacity

Moment capacity:

\[ M_{bld} = \frac{W_{p} f_{y}}{y_{M0}} = \frac{2.149(10)^{3}275}{1.0(10)^{6}} = 591.0 \text{ kN·m} \]

The critical moment is given by:
\[ M_{cr} = C_1 \left( \frac{n^2EI_y}{(kL)^2} I \right)^{1/2} + \left( \frac{(hL)^2Gt}{n^2EI_y} \right) + (C_2 Z_g)^2 - C_2 Z_g \]

where

\[ C_1 = 2.578 \]

\[ C_2 = 1.554 \]

\[ n^2EI_y = 7,477,200 \]

\[ \left( \frac{hL}{kL} \right)^2 = 22,394 \]

\[ (hL)^2Gt = 23,740 \]

\[ C_2 Z_g = 1.554 \times 160 = 248.6 \]

Therefore, \( M_{cr} = 1,540.6 \text{ kN m} \)

From the French NA, \( \lambda_{LT,0} = 0.2 + 0.1 \times \frac{b}{h} = 0.2 + 0.1 \times \frac{300}{327} = 0.292, \beta = 1.0 \)

So, \( \lambda_{LT} = \frac{w_y f y}{M_{cr}} = \sqrt{\frac{2.149 \times 10^3 \times 275}{1.5406 \times 10^6}} = 0.619 \)

\( H/b = 320/300 = 1.067 < 2 \). So, from Table 6.5 of Eurocode 3,

\[ a_{LT} = 0.4 - 0.2 \frac{b}{h} \lambda_{LT}^2 = 0.4 - 0.2 \frac{300}{327} (0.619)^2 = 0.323 \]

From Cl. 6.3.2.3 of Eurocode3:

\[ \Phi_{LT} = 0.5 [1 + a_{LT} (\lambda_{LT} - \lambda_{LT,0}) + \beta \lambda_{LT}^2] = 0.5 [1 + 0.323 \times (0.619 - 0.292) + 0.75 \times 0.619^2] = 0.746 \]

So, \( X_{LT} = \left( \Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta \lambda_{LT}^2} \right) - 1 = 0.861 \)

So, \( kc = 0.9 \) and thus modification factor, \( f = 1 - 0.5 (1 - 0.9) \times (1 - 2(0.619 - 0.8)^2) = 0.953 \)

\( X_{LT, mod} = X_{LT} / f = 0.903 < 1 / \lambda_{LT}^2 = 2.603 \)

\( M_B = \frac{X_{LT} w_y f_y}{f_{M1}} = \frac{0.903 \times 2.149(10)^3 \times 275}{1.0} = 533.8 \text{ kN m} \)

**Compression Capacity**

Critical compressive values:

\[ N_{cry} = \sqrt{\frac{n^2EI_y}{(kL)^2}} = 7,477 \text{ kN} \]

\[ N_{crz} = \sqrt{\frac{n^2EI_z}{(kL)^2}} = 24,943 \text{ kN} \]

\[ \lambda_{cy} = \frac{A \times f_y}{N_{cry}} = 0.770 \]

\[ \lambda_{cz} = \frac{A \times f_y}{N_{crz}} = 0.422 \]
Determine $\chi_y$

$h/b = 1.067 < 1.2$ and $t_f = 20.5 \text{ mm} < 100 \text{ mm}$

So, for $y$-axis, use curve “c”. Hence, $\alpha = 0.49$ [Table 6.2, EC3]

So, $\phi = 0.5[1 + \alpha (\lambda - 0.2) + \lambda^2] = 0.936$

$\chi_y = \sqrt{\frac{1}{\phi + \sqrt{\phi^2 - \lambda^2}}} = 0.681$ (governs)

Determine $\chi_z$

$h/b = 1.067 < 1.2$ and $t_f = 20.5 \text{ mm} < 100 \text{ mm}$

So, for $z$-axis, use curve “b”. Hence, $\alpha = 0.34$ [Table 6.2, EC3]

So, $\phi = 0.5[1 + \alpha (\lambda - 0.2) + \lambda^2] = 0.627$

$\chi_z = \sqrt{\frac{1}{\phi + \sqrt{\phi^2 - \lambda^2}}} = 0.917$ (does not govern)

Compression capacity:

$\chi_y \times N_{Rk} = 0.681 \times 7,477 = 3,020.2 \text{ kN}$

Compression ratio: $25 \text{ kN} / 3,020.2 \text{ kN} = 0.008$

Critical Axial Loads for Flexure and Flexural Torsional Buckling

From NCCI document SN001a-EN-FU:

$$N_{cr,T} = \frac{1}{i_0^2} \left( GI_t + \frac{n^2 E I_w}{l_T^2} \right)$$

where

$$i_0^2 = i_y^2 + i_z^2 + y_0^2 + z_0^2; \text{ here } y_0 = z_0 = 0$$

$$i_y = 75.68 \text{ mm} \text{ and } i_z = 138.23 \text{ mm}$$

$$= 24,835 \text{ mm}^2$$

$$N_{cr,T} = \frac{1}{24,835} \left[ \frac{20,500 \times 225.1 (10)^4}{2.8} + \frac{n^2 (205,000)(2,069)(10)^{12}}{5,000^2} \right] = 13,889 \text{ kN}$$

$$N_{cr,TF} = \frac{i_0^2}{2(i_y^2 + i_z^2)} \left[ N_{cr,y} + N_{cr,T} \cdot \frac{(N_{cr,y} + N_{cr,T})^2 - 4N_{cr,y}N_{cr,T}}{i_y^2 + i_z^2} \right]$$

$$= \frac{1}{2} \left[ 24,943 + 13,889 \cdot \sqrt{(24,943 + 13,889)^2 - 4(24,943)(13,889)^2} \right] = 13,889 \text{ kN}$$

Interaction Check

From Annex A, Table A.1 of EC3, we get the auxiliary terms:

$$\mu_z = \frac{1 \cdot N_{Ed}}{N_{crz}} \cdot \frac{1 \cdot X_z \cdot N_{Ed}}{N_{crz}} = 1.000$$
\[ \mu_y = \frac{1 - N_{Ed}}{N_{cr} N_{Ed}} = 0.999 \]
\[ w_z = w_{plz} / w_{elz} = 1.116 \]
\[ w_y = w_{ply} / w_{ely} = 1.525 > 1.5 \]

The beam has uniform loading and fixed end supports and \( \psi = 1.0 \).

\[ C_{mz,0} = 0.79 + 0.21 \times 1 + 0.36 \left( 1 - 0.33 \right) \frac{25}{24} \frac{943}{25} = 1.000 > 1 - \frac{N_{Ed}}{N_{cr,z}} \]
\[ C_{my,0} = 0.79 + 0.21 \times 1 + 0.36 \left( 1 - 0.33 \right) \frac{25}{4} \frac{477}{10} = 1.001 > 1 - \frac{N_{Ed}}{N_{cr,y}} \]

Determine \( \lambda_0 \): \( C_1 = 1, C_2 = 0, M_{cr} = 1,606 \, kN \cdot m \)

\[ \lambda_0 = \sqrt{\frac{2 \times 149 \times 10^3 \times 275}{1,606 \times 10^6}} = 0.607 \]
\[ \lambda_{0, min} = 0.2 \sqrt{C_{mz,0} \left( 1 - \frac{N_{Ed}}{N_{cr,z}} \right) \left( 1 - \frac{N_{Ed}}{N_{cr,TF}} \right)} = 0.321 \]
\[ a_{LT} = 1 - I_t / I_z = 0.993 \]
\[ \varepsilon_z = \frac{M_{z, Ed}}{N_{Ed}} \times \frac{A}{w_{elz}} = 3.350 \]
\[ C_{mz} = C_{mz,0} \left( 1 - C_{mz,0} \right) \frac{a_{LT}}{1 + \varepsilon_z a_{LT}} = 1.000 \]
\[ C_{my} = C_{my,0} = 1.001 \]
\[ C_{mLT} = C_{mz}^2 \left( 1 - \frac{N_{Ed}}{N_{cr,z}} \right) \left( 1 - \frac{N_{Ed}}{N_{cr,TF}} \right) = 0.995 < 1 \]

So, \( C_{mLT} = 1.0, \lambda_{max} = \max(\lambda_z, \lambda_y) = \lambda_y = 0.770 \)

\[ b_{LT} = 0.5 a_{LT} \lambda_0^2 \frac{M_{y,Ed}}{x_{LT} \times M_{ply, Rd}} \times \frac{M_{z,Ed}}{M_{plz, Rd}} = 0.5 \times 0.993 \times 0.607^2 \frac{5}{0.909 \times 258.3} \times \frac{10}{591} \approx 0 \]
\[ \eta_{pl} = \frac{N_{Ed}}{N_{Rk} \left| M_1 \right|} = \frac{25}{4.496} = 0.006 \]
\[ C_{zz} = 1 + (w_z - 1) \left( \frac{2 - \frac{1.6}{w_z} C_{mz} \lambda_{max}^2 - \frac{1.6}{w_z} C_{mz} \lambda_{max}^2}{1} \right) \eta_{pl} - b_{LT} \]
\[ = 1 + (1.116 - 1) \left( \frac{2 - \frac{1.6}{1.116} \times 1^2 \times 0.770 - \frac{1.6}{1.116} \times 1^2 \times 0.770^2}{0.006} \right) = 1.000 \]
\[ c_{LT} = 10 a_{LT} \lambda_0^2 \frac{1}{5 + \lambda_y} \times \frac{M_{z, Ed}}{C_{mz} x_{LT} M_{plz, Rd}} = 0.013 \]
\[ C_{2y} = 1 + (w_y - 1) \left[ 2 - 14 \frac{C_{my} 2 \lambda_{max}^2}{w_y} \right] \eta_{pl} - c_{LT} = 0.996 \]

\[ C_{2y} > 0.6 \sqrt{\frac{w_y}{w_z}} \times \frac{w_{eLy}}{w_{ply}} = 0.456 \]

\[ d_{LT} = 2 a_{LT} \frac{\lambda_0}{0.1 + \lambda_y^4} \times \frac{M_{z,Ed}}{C_{mz} x_{LT} M_{ply, Rd}} \times \frac{M_{y,Ed}}{C_{my} M_{ply, Rd}} = 2 \times 0.993 \times 0.010 \times 0.993 \times 591 \times 1.000 \times 258.3 = 0.001 \]

\[ C_{yz} = 1 + (w_z - 1) \left[ 2 - 14 \frac{C_{my} 2 \lambda_{max}^2}{w_z} \right] \eta_{pl} - d_{LT} = 0.998 \]

\[ e_{LT} = 1.7 a_{LT} \frac{\lambda_0}{0.1 + \lambda_y^4} \times \frac{M_{z,Ed}}{C_{mz} x_{LT} M_{ply, Rd}} = 1.7 \times 0.993 \times 0.010 \times 0.993 \times 591 = 0.043 \]

\[ C_{yy} = 1 + (w_y - 1) \left[ 2 - 14 \frac{C_{my} 2 \lambda_{max}^2}{w_y} \right] \eta_{pl} - e_{LT} = 0.980 \]

\[ W_{eLy}/W_{ply} = 0.656 < C_{yy}, \text{So, } C_{yy} = 0.980 \]

Interaction factors:

\[ K_{zz} = C_{mz} C_{mLT} \frac{\mu_z}{1 - \frac{N}{N_{crz}}} \frac{1}{C_{zz}} = 1.001 \]

\[ K_{zy} = C_{my} \frac{\mu_y}{1 - \frac{N}{N_{cry}}} \frac{1}{C_{zy}} \frac{w_z}{w_y} = 0.701 \]

\[ K_{yz} = C_{mz} C_{mLT} \frac{\mu_y}{1 - \frac{N}{N_{crz}}} \frac{1}{C_{yz}} \frac{w_z}{w_y} = 0.518 \]

\[ K_{yy} = C_{my} \frac{\mu_y}{1 - \frac{N}{N_{crz}}} \frac{1}{C_{yy}} = 1.023 \]

Check for Clause 6.3.3-661:

\[ \frac{N_{Ed}}{N_{Rk}} X Z M Z, R k X L T \frac{M_{z,Ed}}{M_{z, Rk}} + K_{ZZ} \frac{M_{y,Ed}}{M_{y, Rk}} + K_{zy} \frac{M_{y,Ed}}{M_{y, Rk}} = \frac{25}{0.9174 \times 4.436} + \frac{10}{0.903 \times 591} + \frac{5}{258.3} = 0.038 \]

Check for Clause 6.3.3-662:
\[
\begin{align*}
\frac{N_{Ed}}{N_{Rk}} + K_{xyz} \frac{M_{z,Ed}}{M_{z,Rk}} + K_{xyy} \frac{M_{y,Ed}}{M_{y,Rk}} &= \frac{25}{0.6809 \times 4.436} + \frac{10}{0.903 \times 591} + \frac{1.023}{258.3} = 0.038
\end{align*}
\]

************* END OF TABULATED RESULT OF DESIGN *************
Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, simply-supported span subject to a 30 kN concentrated load at midspan.

Validation

Moment capacity:

\[ M_{ckd} = \frac{W_{pl} y_f}{\gamma_{M0}} = \frac{2.149 \times 10^3 \times 275}{1.0 \times 10^6} = 591.0 \text{ kN m} \]

The critical moment is given by:

\[ M_{cr} = C_1 \frac{n^2 EI_y}{(kL)^2} \left\{ \left[ k k_w \right] \frac{I_w}{I_y} + \frac{(kL)^2 G I_t}{n^2 EI_y} + \left(C_2 Z_g\right)^2 - C_2 Z_g \right\} \]

where

- \( C_1 = 1.35 \)
- \( C_2 = 0.59 \)
- \( n^2 EI_y = 7,477,200 \)
- \( (kL)^2 = 22,394 \)
- \( (kL)^2 G I_t = 23,737 \)
- \( C_2 Z_g = 0.59 \times 160 = 94.4 \)

Therefore, \( M_{cr} = 1,416 \text{ kN m} \)

From the French NA, \( \lambda_{LT, 0} = 0.2 + 0.1 \times b / h = 0.2 + 0.1 \times 300 / 327 = 0.292, \beta = 1.0 \)

So, \( \lambda_{LT} = \sqrt{\frac{w_{pl} y_f}{M_{cr}}} \sqrt{\frac{2.149 \times 10^3 \times 275}{1.416 \times 10^6}} = 0.646 \)

\[ H/b = 320/300 = 1.067 < 2 \]

\[ \alpha_{LT} = 0.4 - 0.2 \times b / h \times \lambda_{LT}^2 = 0.4 - 0.2 \times 300 / 327 \times 0.646^2 = 0.324 \]

From Cl. 6.3.2.3 of Eurocode3:

\[ \Phi_{LT} = 0.5[1 + \alpha_{LT} (\lambda_{LT} - \lambda_{LT, 0}) + \beta \lambda_{LT}^2] = 0.5[1 + 0.324 \times (0.646 - 0.292) + 1 \times 0.646^2] = 0.766 \]

So, \( X_{LT} = \left( \Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta \lambda_{LT}^2} \right)^{-1} = 0.849 \)

\[ M_B = \frac{x_{LT} w_{pl} y_f}{\gamma_{M1}} = \frac{0.849 \times 2.149 \times 10^3 \times 275}{1.0 \times 10^6} = 501.9 \text{ kN m} \]

V. EC3 French NA - I Section with UDL

Calculate the bending capacity of a beam using an I section subject to a uniformly distributed load per the French NA to EC3.

Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, fixed-fixed span subject to a 10 kN/m uniform load.
Validation

Moment capacity:

\[ M_{ckd} = \frac{W_{ply} f_y}{f_{M0}} = \frac{2.149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN m} \]

The critical moment is given by:

\[ M_{cr} = C_1 \frac{n^2 EI}{(kL)^2} \left[ \frac{k}{k_y} \right] I_w + \frac{(kL)^2 G_I}{n^2 EI} + (C_2 Z_g)^2 \left[ 1 - C_2 Z_g \right] \]

where

\[ C_1 = 2.578 \]
\[ C_2 = 1.554 \]
\[ \frac{n^2 EI}{y} = 7,477,200 \]
\[ \frac{(kL)^2}{y} = 22,394 \]
\[ \frac{(kL)^2 G_I}{y} = 23,737 \]
\[ C_2 Z_g = 1.554 \times 160 = 248.6 \]

Therefore, \( M_{cr} = 1,539 \text{ kN m} \)

From the French NA, \( \lambda_{LT, 0} = 0.2 + 0.1 \times b / h = 0.2 + 0.1 \times 300 / 327 = 0.292, \beta = 1.0 \)

So, \( \lambda_{LT} = \sqrt{\frac{w_y f_y}{M_{cr}}} = \sqrt{\frac{2.149 \times (10)^3 \times 275}{1,539 \times (10)^6}} = 0.620 \)

\[ H/b = 320/300 = 1.067 < 2 \]
\[ a_{LT} = 0.4 \times 0.2 \times b / h \times \lambda_{LT}^2 = 0.4 \times 0.2 \times 300 / 327 \times 0.620^2 = 0.330 \]

From Cl. 6.3.2.3 of Eurocode3:

\[ \Phi_{LT} = 0.5[1 + a_{LT} (\lambda_{LT} - \lambda_{LT, 0}) + \beta \lambda_{LT}^2] = 0.5[1 + 0.330 \times (0.620 - 0.292) + 1 \times 0.620^2] = 0.746 \]

So, \( x_{LT} = \left( \Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta \lambda_{LT}^2} \right)^{-1} = 0.861 \)

\[ k_c = 0.9 \]

Modification factor: \( f = 1 - 0.5(1 - k_c) \left[ 1 - 2(\lambda_{LT} - 0.8)^2 \right] = 1 - 0.5(1 - 0.9) \left[ 1 - 2(0.620 - 0.8)^2 \right] = 0.953 \)

\[ x_{LT, mod} = \frac{x_{LT}}{f} = 0.903 < \frac{1}{\lambda_{LT}^2} = 2.603, \text{ OK} \]

\[ M_B = \frac{x_{LT} w_y f_y}{y_{M1}} = \frac{0.903 \times 2.149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 533.8 \text{ kN m} \]

V. EC3 French NA - Tee Section

Calculate the bending capacity of a beam using an Tee section subject to a uniformly distributed load and varying end moments per the French NA to EC3.

Details
The section is an Indian INST100 with \( f_y = 300 \text{ MPa} \). The member is a 5 m, simply-supported span under a 2 kN/m uniform load. The left support has a -5.0 kN·m moment applied and the right support has a 2.5 kN·m moment applied.

Validation
Moment capacity:

\[
M_{ckd} = \frac{W_{ply} f_y}{r_{M0}} = \frac{45.5 \times (10)^3 \times 300}{1.0 \times (10)^6} = 13.7 \text{ kN m}
\]

The critical moment is given by:

\[
M_{cr} = C_1 \frac{n^2 EI_y}{(k_z L)^2} \left[ \left( \frac{k_z}{k_w} \right) \frac{I_w}{I_y} + \frac{(k_z L)^2 G I_T}{n^2 E I_y} + \left( C_2 Z_g \cdot C_3 Z_j \right)^2 - \left( C_2 Z_g \cdot C_3 Z_j \right) \right]
\]

where

\[
\begin{align*}
C_1 &= 1.0 \\
C_2 &= 1.0 \\
C_3 &= 1.0 \\
\frac{n^2 E I_y}{(k L)^2} &= 64,421 \\
\left( \frac{k_z}{k_w} \right)^2 \frac{I_w}{I_y} &= \left( \frac{1}{T} \right)^2 \frac{30.76}{79.6} = 0.386 \\
\frac{(k L)^2 G I_T}{n^2 E I_y} &= \frac{(1 \times 5,000)^2 \times 205,000 \times 7.33 \times (10)^4}{2.6 \times n^2 \times 205,000 \times 79.6 \times (10)^4} = 89,714
\end{align*}
\]
\[ C_2 Z_g = \frac{1.0 \times 10}{2} = 5 \]
\[ \Psi_f = 1 (I_f = 0, \text{as there is no tension flange present in the Tee section}) \]
\[ h_s = D - 0.5 \times t_f = 100 - 0.5 \times 10 = 95 \text{ mm} \]
\[ z_i = 0.8 \times \Psi_f h_s / 2 = 0.8 \times 1 \times 95 / 2 = 38 \text{ mm} \]
\[ C_3 Z_j = 1.0 \times 38 = 38 \]

Therefore, \( M_{cr} = 1.0 \times 64,421 \left[ \sqrt{0.386 + 89,714 + (5 - 38)^2} - (5 - 38) \right] = 21.5 \text{ kN} \cdot \text{m} \)

**V. EC3 French NA - Varying End Mom CMM8**

Calculate the bending capacity of a beam using an I section subject to a concentrated load and varying end moments per the French NA to EC3.

**Details**

The section is a HD320X127, Grade S275 steel. The member is a 5 m, simply-supported span subject to a 10 kN/m uniform load. The left support has a -10.0 kN-m moment applied and the right support has a 8.0 kN-m moment applied.

**Validation**

Moment capacity:

\[
M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{2.149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN m}
\]

The critical moment is given by:
\[ M_{cr} = C_1 \left[ \sum_{k=1}^{n^2EI_y \left( kL \right)^2} \left( \frac{k}{k_w} \right)^2 I_w \frac{T_y}{T_y} \frac{\left( kL \right)^2 GI_t}{n^2EI_y} + \left( C_2Z_g \right)^2 - C_2Z_g \right] \]

where
\[ k_w = \frac{7,477,200}{n^2EI_y} \]
\[ \frac{\left( kL \right)^2 GI_t}{n^2EI_y} = 22,394 \]
\[ C_2Z_g = 0.17 \times 160 = 27.2 \]
\[ \mu = \frac{FL}{4M} = \frac{4 \times 5}{4 \times 10} = 0.5 > 0 \]

From the graph, \( C_1 = 1.184, C_2 = 0.17 \)
\[ C_2Z_g = 0.17 \times 160 = 27.2 \]

Therefore, \( M_{cr} = 1,676 \text{ kN·m} \)

Validation

Section Properties

Moment of inertia about major axis,
\[ I_z = 2\left[ \frac{30 \times (2.05)^3}{12} + 30(2.05)\left( \frac{27.9 + 2.05}{2} \right)^2 \right] + \frac{1.15(27.9)^3}{12} = 29,707 \text{ cm}^4 \]

Moment of inertia about minor axis,
\[ I_z = 2\left[ \frac{2.05 \times (30)^3}{12} \right] + \frac{27.9(1.15)^3}{12} = 9,229 \text{ cm}^4 \]

Elastic section modulus about major axis, \( Z_z = \frac{29,707}{32} = 923.3 \text{ cm}^3 \)

Elastic section modulus about minor axis, \( Z_y = \frac{9,229}{30} = 307.6 \text{ cm}^3 \)

Plastic section modulus about major axis,
\[ W_{\text{ply}} = \frac{30(32)^2}{4} \cdot \frac{(30 - 1.15)(27.9)^2}{4} = 2,066 \text{ cm}^3 \]

Torsional constant,
\[ J = 2\left[ \frac{30(2.05)^3}{3} \right] + \frac{27.9(1.15)^3}{3} = 186.4 \text{ cm}^4 \]

Warping constant,
\[ I_w = \frac{(32 - 2.05)^2(30)^3}{24} = 2,068,700 \text{ cm}^6 \]

Moment capacity:
\[ M_{ckd} = \frac{W_{\text{ply}} f_y}{I_{M0}} = \frac{2,066 \times (10)^3 \times 275}{1.0 \times (10)^6} = 568.1 \text{ kN} \cdot \text{m} \]

The critical moment is given by:
\[ M_c = C_1 \frac{2EI_k^2}{(kL)^2} \left[ \frac{k}{k_w} \right]^2 I_w + \frac{(kL)^2 G I_t}{n^2 EI} + \left( C_2 Z_g \right)^2 - C_2 Z_g \]

where
\[ C_1 = 0.712 \]
\[ C_2 = 0.652 \]
\[ k = 0.5 \]
\[ n^2 EI_y = 29,909,000 \]
\[ \frac{(kL)^2}{2} \]
\[ \left( \frac{k}{k_w} \right)^2 I_w + \frac{(kL)^2 G I_t}{n^2 EI_y} \]
\[ C_2 Z_g = 0.652 \times 160 = 104.3 \]

Therefore, \( M_c = 966.7 \text{ kN} \cdot \text{m} \)
From the German NA, $\lambda_{LT, 0} = 0.4, \beta = 0.75$

So, $\lambda_{LT} = \sqrt{\frac{w_y f_y}{M_{cr}}} = \sqrt{\frac{2.066 \times (10)^3 \times 275}{966.7 \times (10)^6}} = 0.767$

$H/b = 320/300 = 1.067 < 2$. So, use buckling curve "c". From Table 6.5 of Eurocode 3, $\alpha_{LT} = 0.49$.

From Cl. 6.3.2.3 of Eurocode3:

$$\Phi_{LT} = 0.5[1 + \alpha_{LT} (\lambda_{LT} - \lambda_{LT, 0}) + \beta \lambda_{LT}^2] = 0.5[1 + 0.49(0.767 - 0.2) + 1 \times 0.767^2] = 0.810$$

So, $\chi_{LT} = \Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta \lambda_{LT}^2} = 1.185 > 1.0$; use the value from Table 6.6 of EC3: $k_c = 0.9$.

Modification factor: $f = 1 - 0.5(1 - k_c)[1 - 2(\lambda_{LT} - 0.8)^2] = 1 - 0.5(1 - 0.9)[1 - 2(0.767 - 0.8)^2] = 0.950$

$X_{LT, mod} = \frac{\chi_{LT}}{f} = 0.883 < \frac{1}{\lambda_{LT}^2} = 1.702$, OK

$$M_B = \frac{\chi_{LT} w_y f_y \gamma M_{1}}{\gamma M_{1}} = \frac{0.826 \times 2.066 \times (10)^3 \times 275}{1.1} = 426.5 \text{ kN} \cdot \text{m}$$

Torsion has not been considered in the design.
V. EC3 German NA - I Section with Conc Load

Calculate the bending capacity of a beam subject to a concentrated load per the German NA to EC3.

Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, simply-supported span subject to a 30 kN concentrated load at midspan.

Validation

Moment capacity:

\[ M_{c,b} = \frac{W_{p, y}}{\gamma_0} = \frac{2.149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN m} \]

The critical moment is given by:

\[
M_{cr} = C_1 \left( \frac{n^2EI_y}{(kL)^2} \right)^2 \left( \frac{k}{k_w} \right) \frac{I_w}{T_y} + \frac{(kL)^2 G I_t}{n^2EI_y} + (C_2 Z_y)^2 - C_2 Z_g \]

where

\[
C_1 = 1.348
\]

\[
C_2 = 0.63
\]

\[
\frac{n^2EI_y}{(kL)^2} = 7,477,200
\]

\[
\left( \frac{k}{k_w} \right) \frac{I_w}{T_y} = 22,394
\]

\[
\frac{(kL)^2 G I_t}{n^2EI_y} = 23,737
\]

\[
C_2 Z_g = 0.63 \times 160 = 100.8
\]

Therefore, \( M_{cr} = 1,375 \text{ kN m} \)

From the German NA, \( \lambda_{LT, 0} = 0.4, \beta = 0.75 \)

So, \( \lambda_{LT} = \sqrt{\frac{W_{p, y} f_y}{M_{cr}}} = \sqrt{\frac{2.149 \times (10)^3 \times 275}{1,375 \times (10)^6}} = 0.656 \)

\[ H/b = 320/300 = 1.067 < 2 \]

So from Table 6.5 of Eurocode 3: \( a_{LT} = 0.34 \)

From Cl. 6.3.2.3 of Eurocode3:

\[ \Phi_{LT} = 0.5[1+a_{LT} (\lambda_{LT} - \lambda_{LT, 0}) + 8 \times \lambda_{LT}^2] = 0.5[1 + 0.34(0.656 - 0.4) + 0.75 \times 0.656^2] = 0.705 \]

\[ kc = 1 \]

So, \( X_{LT} = \left( \Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta \lambda_{LT}^2} \right)^{-1} = 0.891 \)

Modification factor: \( f = 1 - 0.5(1 - 1) \times [1 - 2(0.656 - 0.8)^2] = 1.0 \)
\[ x_{LT,mod} = \frac{x_{LT}}{f} = \frac{0.891}{l} < 1 \]
\[ \frac{1}{\lambda_{LT}^2} = 2.897, \text{OK} \]

\[ M_B = \frac{x_{LT}f_y}{y_{M1}} = 0.891 \times 2.149 \times (10)^3 \times 275 \times 1.1 \times (10)^6 = 478.9 \text{ kN·m} \]

V. EC3 German NA - Column with Axial Load

Calculate the axial and bending capacities and interaction ratios of a column using the German NA to EC3.

Details

The 5 m tall column as a fixed base and is free to translate and rotate at the top. The column is subject to a 25 kN compressive load and moments of 5 kN·m about the X axis and 10 kN·m about the Z axis. The section is an HD320X127, grade S275 steel.

Validation

Bending Capacity

Moment capacity:

\[ M_{ckd} = \frac{W_{plf} f_y}{r_M} = \frac{2.149(10)^3}{1.0(10)^6} = 591.0 \text{ kN·m} \]

The critical moment is given by:

\[ M_{cr} = C_1 \frac{E I}{k w} \left( k w \right)^2 + \frac{(kL)^2 G I_t}{n^2 E I} + \left( C_2 Z_g \right)^2 \]

where

\[ C_1 = 2.578 \]
\[ C_2 = 1.554 \]

*************** END OF TABULATED RESULT OF DESIGN ***************
\[
\frac{n^2 EI_y}{(kL)^2} = 7,477,200
\]
\[
\left(\frac{k}{k_w}\right)^2 \frac{I_w}{T_y} = 22,394
\]
\[
\frac{(kL)^2 G I_t}{n^2 EI_y} = 23,740
\]
\[
C_2 Z_g = 1.554 \times 160 = 248.6
\]

Therefore, \( M_{cr} = 1,540.6 \text{ kN m} \)

From the German NA, \( \lambda_{LT,0} = 0.4, \beta = 0.75 \)

So, \( \lambda_{LT} = \sqrt{\frac{w_y \gamma_1}{M_{cr}}} = \sqrt{\frac{2.149 \times 10^3 \times 275}{1.5406 \times 10^6}} = 0.619 \)

\( H/b = 320/300 = 1.067 < 2 \) So, from Table 6.5 of Eurocode 3, \( a_{LT} = 0.34 \).

From Cl. 6.3.2.3 of Eurocode 3:

\[ \Phi_{LT} = 0.5[1 + a_{LT} (\lambda_{LT} - \lambda_{LT,0}) + 0.4 \times \lambda_{LT}^2] = 0.5[1 + 0.34 \times (0.619 - 0.4) + 0.75 \times 0.619^2] = 0.681 \]

So, \( X_{LT} = \left( \Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta \lambda_{LT}^2} \right)^{-1} = 0.908 \)

\( h_c = \left( \frac{1}{\sqrt{C_1}} \right) = \frac{1}{\sqrt{2.578}} = 0.623 \) and thus modification factor, \( f = 1 - 0.5(1 - 0.623) \times [1 - 2(0.619 - 0.8)^2] = 0.824 \)

\( X_{LT,mod} = X_{LT} / f = 0.824 = 1.102 > 1 \)

So, \( X_{LT,mod} = 1.0 \)

\[
M_B = \frac{X_{LT} w_y f_y}{y_{M1}} = \frac{1.0 \times 2.149 (10)^3 \times 275}{1.1} = 537.3 \text{ kN m}
\]

Compression Capacity

Critical compressive values:

\[
N_{cry} = \sqrt{\frac{n^2 EI_y}{(kL)^2}} = 7,477 \text{ kN}
\]

\[
N_{crz} = \sqrt{\frac{n^2 EI_z}{(kL)^2}} = 24,943 \text{ kN}
\]

\[
N_{c,Rd} = A g f_y / \gamma_{M0} = 16,130 \times 275 / 1.0 (10)^3 = 4,436 \text{ kN}
\]

for a Class 1 section.

Check the flexural buckling resistance per Cl. 6.3.1.1.

\[
N_{b,Rd} = \chi \times A g f_y / \gamma_{M1}
\]

for a Class 1 section.

Buckling curves for I section are found in Table 6.2. Imperfection factor, \( \alpha \), values are found in Table 6.1.

Along Z

\( h/b = 1.067 < 2 \)

\( t_f = 20.5 < 100 \)
So, for the z-z axis, use curve “b”. Hence, \( a = 0.34 \) (EC3 Table 6.2).

\[
\lambda_{cz} = \sqrt{\frac{A \times f_y}{N_{crz}}} = \frac{L_{cr}}{i_z \times \lambda_1}
\]

where

\[
\begin{align*}
L_{cr} &= 5,000 \text{ mm} \\
i_z &= 138.2 \text{ mm} \\
\lambda_1 &= 93.9e = 93.9\sqrt{\frac{235}{f_y}} = 93.9\sqrt{\frac{235}{275}} = 86.80
\end{align*}
\]

Thus, \( \lambda_{cz} = \frac{5,000}{\frac{75.68 \times 86.80}{738.2}} = 0.417 \)

\[
\phi = 0.5[1+\alpha (\lambda_z - 0.2) +\lambda^2)] = 0.624
\]

\[
X_z = \frac{1}{\phi + \sqrt{\phi^2 - \lambda^2}} = 0.919
\]

Compression capacity about Z:

\[
N_{b,Rd} = X_z \times A \times f_y / \gamma_{M1} = 0.919 \times 16,130 \times 275 / 1.1 = 3,707.5 \text{ kN}
\]

Along Y

For the y-y axis, use curve “c”. Hence, \( a = 0.49 \) (EC3 Table 6.2).

\[
\lambda_{cy} = \sqrt{\frac{A \times f_y}{N_{crz}}} = \frac{L_{cr}}{i_y \times \lambda_1}
\]

where

\[
\begin{align*}
L_{cr} &= 5,000 \text{ mm} \\
i_y &= 75.68 \text{ mm} \\
\lambda_1 &= 93.9e = 93.9\sqrt{\frac{235}{f_y}} = 93.9\sqrt{\frac{235}{275}} = 86.80
\end{align*}
\]

Thus, \( \lambda_{cy} = \frac{5,000}{\frac{75.68 \times 86.80}{738.2}} = 0.761 \)

\[
\phi = 0.5[1+\alpha (\lambda_z - 0.2) +\lambda^2)] = 0.827
\]

\[
X_y = \frac{1}{\phi + \sqrt{\phi^2 - \lambda^2}} = 0.687
\]

Compression capacity about Z:

\[
N_{b,Rd} = X_y \times A \times f_y / \gamma_{M1} = 0.687 \times 16,130 \times 275 / 1.1 = 2,768.6 \text{ kN}
\]

Thus, the compression capacity, \( N_{b,Rd} = 2,768.6 \text{ kN} \)

Compression ratio: \( 25 \text{ kN} / 2,768.6 \text{ kN} = 0.009 \)

Critical Axial Loads for Flexure and Flexural Torsional Buckling

From NCCI document SN001a-EN-FU:

\[
N_{cr,T} = \frac{1}{i_0^2} \left( GI_l + \frac{n^2 E I_w}{i_T^2} \right)
\]

where

\[
i_o^2 = i_y^2 + i_z^2 + y_0^2 + z_0^2; \text{ here } y_0 = z_0 = 0
\]
\[ i_y = 75.68 \text{ mm and } i_z = 138.23 \text{ mm} \]
\[ = 24,835 \text{ mm}^2 \]
\[ N_{cr,T} = \frac{1}{24,835} \left[ \frac{20,500 \times 225.1 (10)^4}{2.8} + n^2 \left( \frac{205,000 \times 2.069 (10)^{12}}{5,000^2} \right) \right] = 13,889 \text{ kN} \]
\[ N_{cr,TF} = \frac{\sqrt{i_y^2 + i_z^2}}{2} \left( N_{cr,y} + N_{cr,T} \cdot \sqrt{(N_{cr,y} + N_{cr,T})^2 - 4N_{cr,y}N_{cr,T} \frac{i_y^2 + i_z^2}{i_y^2}} \right) \]
\[ = \frac{1}{2} \left[ 24,943 + 13,889 \cdot \sqrt{(24,943 + 13,889)^2 - 4(24,943)(13,889)^2} \right] = 13,889 \text{ kN} \]

**Interaction Check**

From Annex B, Table B.3 of EN 1993:1-1:2005,
\[ W_z = \frac{W_{plz}}{W_{elz}} = 2.149 / 1.926 = 1.116 \]
\[ W_y = \frac{W_{ply}}{W_{ely}} = 939 / 615.9 = 1.525 > 1.5; W_y = 1.5 \]
\[ \psi = 1.0 \]

So, \( C_{mz} = 0.6 + 0.4\psi = 1.0 \)
\( C_{mLT} = C_{mz} = 1.0 \)
\( C_{my} = 0.6 + 0.4\psi = 1.0 \)

Interaction factors:
\[ K_{zz} = C_{mz} \left[ 1 + \lambda_z \cdot 0.2 \right] \frac{N_{Ed}}{N_{Rk} \gamma_{M1}} = 1 \left[ 1 + (0.422 \cdot 0.2) \frac{25}{0.917 \times 4,436} \right] = 1.001 \]
\[ K_{yy} = C_{my} \left[ 1 + (2\lambda_y \cdot 0.6) \right] \frac{N_{Ed}}{N_{Rk} \gamma_{M1}} = 1 \left[ 1 + (2 \times 0.770 \cdot 0.6) \frac{25}{0.681 \times 4,436} \right] = 1.008 \]
\[ K_{yz1} = 0.6K_{zz} = 0.601 \]
\[ K_{yz2} = 1 + \frac{0.1 \times \lambda_y}{C_{mLT} - 0.25} \frac{N_{Ed}}{N_{Rk} \gamma_{M1}} = 1 \left[ \frac{0.1 \times 0.770}{(1 - 0.25)} \frac{25}{0.681 \times 4,436} \right] = 0.999 \]

So, \( K_{yz} = \text{maximum}(K_{yz1}, K_{yz2}) = 0.999 \)
\[ K_{zy} = 0.6 \times K_{yy} = 0.6(1.008) = 0.605 \]

Check for Clause 6.3.3-661:
\[
\frac{N_{Ed}}{N_{Rk}} + K_{ZZ} \frac{M_{z,Ed}}{M_{z,Rk}} + K_{zy} \frac{M_{y,Ed}}{M_{y,Rk}} = \frac{25 \times 1.1}{0.9174 \times 4,436} + \frac{10 \times 1.1}{1.0 \times 591} + \frac{0.605 \times 5 \times 1.1}{258.3} = 0.038
\]

Check for Clause 6.3.3-662:
\[
\frac{N_{Ed}}{N_{Rk}} + K_{yz} \frac{M_{z,Ed}}{M_{z,Rk}} + K_{yy} \frac{M_{y,Ed}}{M_{y,Rk}} = \frac{25 \times 1.1}{0.681 \times 4,436} + \frac{0.999 \times 10 \times 1.1}{1.0 \times 591} + \frac{1.008 \times 5 \times 1.1}{258.3} = 0.049
\]

V. EC3 German NA - I Section with UDL

Calculate the bending capacity of a beam using an I section subject to a uniformly distributed load per the German NA to EC3.

Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, fixed-fixed span subject to a 10 kN/m uniform load.
Validation

Moment capacity:

\[ M_{ckd} = \frac{W_{plyf_y}}{\gamma_{M0}} = \frac{2.149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN m} \]

The critical moment is given by:

\[ M_{cr} = C_1 \frac{n^2 EI_y}{(kL)^2} \left[ \frac{(kL)^2 G I_t}{n^2 EI_y} + \left( C_2 Z_g \right)^2 \right] \]

where

\[ C_1 = 0.712 \]
\[ C_2 = 0.652 \]
\[ k = 0.5 \]
\[ n^2 EI_y = 29,909,000 \]
\[ \frac{(kL)^2}{(kL)^2} \]
\[ \frac{(kL)^2 G I_t}{n^2 EI_y} = 5,934 \]
\[ C_2 Z_g = 0.652 \times 160 = 104.3 \]

Therefore, \( M_{cr} = 966.7 \text{ kN m} \)

From the German NA, \( \lambda_{LT, 0} = 0.4 \), \( \beta = 0.75 \)

So, \( \lambda_{LT} = \sqrt[2.5]{\frac{w_yf_y}{M_{cr}}} = \sqrt[2.5]{\frac{2.149 \times (10)^3 \times 275}{966.7 \times (10)^6}} = 0.782 \)

\( H/b = 320/300 = 1.067 < 2 \). So, from Table 6.5 of Eurocode 3, \( \alpha_{LT} = 0.34 \).

From Cl. 6.3.2.3 of Eurocode3:

\[ \Phi_{LT} = 0.5 \left[ 1 + \alpha_{LT} (\lambda_{LT} - \lambda_{LT, 0}) + 6 \times \lambda_{LT}^2 \right] = 0.5 \left[ 1 + 0.34 \times (0.782 - 0.2) + 1 \times 0.782^2 \right] = 0.794 \]

So, \( X_{LT} = \left( \Phi_{LT} + \sqrt{\Phi_{LT}^2 - 6 \lambda_{LT}^2} \right) \frac{1}{\lambda_{LT}^2} = 0.827 \)

So, \( k_c = 1 / \sqrt{\Phi_{LT}^2} = 1 / \sqrt{0.794} = 1.182 > 1 \) but this value cannot be used, so from Table 6.6 of the Eurocode 3, \( k_c = 0.9 \)

Modification factor: \( f = 1 - 0.5 (1 - k_c) [1 - 2(\lambda_{LT} - 0.8)^2] = 1 - 0.5 (1 - 0.9) [1 - 2(0.782 - 0.8)^2] = 0.950 \)

\( X_{LT,mod} = \frac{X_{LT}}{f} = 0.871 < \frac{1}{\lambda_{LT}^2} = 1.635 \), OK

\[ M_B = \frac{X_{LT} w_yf_y}{\gamma_{M1}} = \frac{0.871 \times 2.149(10)^3 \times 275}{1.1} = 467.7 \text{ kN m} \]

STAAD.Pro Input

The file C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 German NA - I Section with UDL.std is typically installed with the program.

The following D5.C.6 Design Parameters (on page 1493) are used:

- The German NA is specified using NA 10
- Fully fixed span: CMN 0.5
- Uniformly distributed load w/ fixed-fixed supports: CMM 2
- The value of C2 0.652 is specified
- The parameter KC 0 instructs the program to calculate the value of $k_c$
- A second design parameter set is used with MTH 1 to use Cl 6.3.2.2 to determine $\Phi_{LT}$

Note: The previously set parameters are still used as they are not specified again with a different value, which is the default behavior in STAAD.Pro batch design.

V. EC3 Malaysian NA - Channel Section with Conc Load

Calculate the bending capacity of a channel section beam under subject to a pair of concentrated load per the Malaysian NA to EC3

Details

The section is a C15X50, grade S275 steel. The member is a 6 m span, simply supported beam is subject to two concentrated loads of 10 kN each at the 1/3 points (2 m from either support).

Validation

Moment capacity:

\[ M_{chd} = \frac{W_{pl}f_y}{f_{Mo}} = \frac{1.123(10)^3275}{1.0(10)^8} = 308.7 \text{ kN} \cdot \text{m} \]

The critical moment is given by:

\[ M_{cr} = C_1 \frac{n^2 E I_z}{(k_z L)^2} \left[ \left( \frac{k_z}{k_w} \right)^2 \frac{T_w}{t_z} + \left( \frac{k_z L}{n^2 E I_z} \right)^2 \frac{2G I_T}{(C_2 Z_g \cdot C_3 Z_j)^2 - (C_2 Z_g \cdot C_3 Z_j)} \right] \]

where

\[ C_1 = 1.046 \]
\[ C_2 = 0.42 \]
\[ C_3 = 1.0 \]
Results

V. EC3 Malaysian NA - I Section with Conc Load

Calculate the bending capacity of a beam subject to a concentrated load per the Malaysian NA to EC3.

Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, simply-supported span subject to a 30 kN concentrated load at midspan.

Validation

Moment capacity:

\[
M_{ckd} = \frac{W_{ply} f_y}{f_{M0}} = \frac{2.149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN m}
\]

The critical moment is given by:

\[
M_{cr} = C_1 \frac{n^2 EI}{(kL)^2} \left\{ \frac{k}{h_w} \left( \frac{I_w}{T} \right)^2 + \frac{(kL)^2 G I_t}{n^2 E I} + (C_2 Z_g)^2 - C_2 Z_g \right\}
\]
where

\[
\begin{align*}
C_1 &= 1.348 \\
C_2 &= 0.63 \\
n^2 EI_y &= 7,477,200 \\
\left(\frac{kL}{(k_w)^2}\right)^2 &= 22,394 \\
\left(\frac{k_w}{T_y}\right)^2 &= 23,737 \\
C_2 Z_g &= 0.63 \times 160 = 100.8
\end{align*}
\]

Therefore, \(M_{cr} = 1,375 \text{ kN·m}\)

From the Malaysian NA, \(\lambda_{LT, 0} = 0.4, \beta = 0.75\)

So, \(\lambda_{LT} = \sqrt{\frac{w_y f_y}{M_{cr}}} = \sqrt{\frac{2,149 \times (10)^3 \times 275}{1,375 \times (10)^6}} = 0.656\)

\(H/b = 320/300 = 1.067 < 2\). So, from Table 6.5 of Eurocode 3, \(\alpha_{LT} = 0.34\).

From Cl. 6.3.2.3 of Eurocode3:

\[
\phi_{LT} = 0.5 [1 + \alpha_{LT} (\lambda_{LT, 0} - \lambda_{LT})] + 8 x \lambda_{LT}^2 = 0.5 [1 + 0.34 \times (0.656 - 0.4) + 1 \times 0.656^2] = 0.705
\]

So, \(X_{LT} = \phi_{LT} + \sqrt{\phi_{LT}^2 - \beta \lambda_{LT}^2} = 0.934\)

So, \(kc = 1 / \sqrt{C_2} = 1 / \sqrt{1.348} = 0.861\)

Modification factor: \(f = 1 - 0.5(1 - 0.861) \times [1 - 2(0.656 - 0.8)^2] = 0.934\)

\(X_{LT,mod} = \frac{X_{LT}}{f} = 0.955 < \frac{1}{\lambda_{LT}^2} = 2.897, \text{ OK}\)

\[
M_B = \frac{X_{LT} w_y f_y}{Y_{M1}} = \frac{0.955 \times 2,149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 564.3 \text{ kN·m}
\]

Results

Torsion has not been considered in the design.
V. EC3 Malaysian NA - I Section with UDL

Calculate the bending capacity of a beam using an I section subject to a uniformly distributed load per the Malaysian NA to EC3.

Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, fixed-fixed span subject to a 10 kN/m uniform load.

Validation

Moment capacity:

\[ M_{ckd} = \frac{W_{pl} f_y}{3M_0} = \frac{2.149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN·m} \]

The critical moment is given by:

\[ M_{cr} = C_1 \left( \frac{n^2 EI}{(kL)^2} \right) \left\{ \frac{(kL)^2 I_w}{T} + \frac{(kL)^2 G_I}{n^2 EI} + \left[ (C_2 Z_g)^2 - C_2 Z_g \right] \right\} \]

where

- \( C_1 = 0.712 \)
- \( C_2 = 0.652 \)
- \( k = 0.5 \)
- \( I_w = 29,909,000 \)
- \( \left( \frac{kL}{k_w} \right)^2 T = 5,599 \)
- \( \left( \frac{kL}{k_w} \right)^2 G_I = 5,934 \)
- \( \frac{n^2 EI}{n^2 EI} = 0.652 \times 160 = 104.3 \)

Therefore, \( M_{cr} = 966.7 \text{ kN·m} \)

From the Malaysian NA, \( \lambda_{LT,0} = 0.4, \beta = 0.75 \)

So, \( \lambda_{LT} = \frac{\sqrt{\frac{w_{pl} f_y}{M_{cr}}}}{\sqrt[3]{\frac{2.149 \times (10)^3 \times 275}{966.7 \times (10)^6}}} = 0.782 \)

\( H/b = 320/300 = 1.067 < 2 \). So, from Table 6.5 of Eurocode 3, \( \alpha_{LT} = 0.34 \).

From Cl. 6.3.2.3 of Eurocode3:

\[ \Phi_{LT} = 0.5[1+\alpha_{LT} (\lambda_{LT} - \lambda_{LT,0}) + \beta \lambda_{LT}^3] = 0.5[1 + 0.34 \times (0.782 - 0.2) + 1 \times 0.782^3] = 0.794 \]

So, \( \chi_{LT} = (\Phi_{LT} + \sqrt[3]{\Phi_{LT}^2 - \beta \lambda_{LT}^3})^{-1} = 0.827 \)
So, \( k_c = \frac{1}{\sqrt{C_1}} = \frac{1}{\sqrt{0.712}} = 1.182 > 1 \) but this value cannot be used, so from Table 6.6 of the Eurocode 3, \( k_c = 0.9 \)

Modification factor: \( f = 1 - 0.5(1 - k_c)[1 - 2(\lambda_{LT} - 0.8)^2] = 1 - 0.5(1 - 0.9)[1 - 2(0.782 - 0.8)^2] = 0.950 \)

\[ X_{LT, mod} = \frac{X_{LT}}{f} = 0.871 < \frac{1}{\lambda_{LT}^2} = 1.635, \text{OK} \]

\[ M_B = \frac{X_{LT}w_yf_y}{\gamma_{M1}} = \frac{0.871 \times 2.149(10)^3 \times 275}{1.0} = 514.4 \text{ kN \cdot m} \]

V. EC3 Malaysian NA - Tee Section

Calculate the bending capacity of a beam using an Tee section subject to a uniformly distributed load and varying end moments per the Malaysian NA to EC3.

Details

The section is an Indian INST100 with $f_y = 300$ MPa. The member is a 5 m, simply-supported span under a 2 kN/m uniform load. The left support has a -5.0 kN·m moment applied and the right support has a 2.5 kN·m moment applied.

Validation

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_M} = \frac{45.5 \times (10)^3 \times 300}{1.0 \times (10)^6} = 13.7 \text{ kN m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 E I}{(k_z L)^2} \left[ \frac{k_z^2 I_z}{T_z} + \frac{(k_z L)^2 G I_T}{n^2 E I_z} + (C_2 Z_g \cdot C_3 Z_f)^2 - (C_2 Z_g \cdot C_3 Z_f) \right]$$

where

$$C_1 = 1.0$$
\[
\begin{align*}
C_2 &= 1.0 \\
C_3 &= 1.0 \\
\frac{n^2 EI_y}{(kL)^2} &= 64,421 \\
\left(\frac{k}{k_w}\right)^2 I_w \frac{1}{T_y} &= \left(\frac{1}{T}\right)^2 = 30.76 \\
\frac{(kL)^2 G I_T}{n^2 EI_y} &= \frac{(1\times5,000)^2\times205,000\times7.33\times(10)^4}{2.6\times205,000\times79.6\times(10)^4} = 89,714 \\
C_2 Z_g &= 1.0\times10 / 2 = 5 \\
\Psi_f &= I (I_f = 0, \text{as there is no tension flange present in the Tee section}) \\
h_s &= D - 0.5\times t = 100 - 0.5 \times 10 = 95 \text{ mm} \\
z_j &= 0.8\times\Psi_f / h_s / 2 = 0.8\times1\times95 / 2 = 38 \text{ mm} \\
C_3 Z_j &= 1.0 \times 38 = 38
\end{align*}
\]

Therefore, \( M_{cr} = 1.0 \times 64,421 \left[ \sqrt{0.386 + 89,714 + (5 - 38)^2 - (5 - 38)} \right] = 21.5 \text{ kN m} \)

V. EC3 Polish NA - Column with Axial Load

Calculate the axial and bending capacities and interaction ratios of a column using the Polish NA to EC3.

Details

The 5 m tall column as a fixed base and is free to translate and rotate at the top. The column is subject to a 25 kN compressive load and moments of 5 kN·m about the X axis and 10 kN·m about the Z axis. The section is an HD320X127, grade S275 steel.

Validation

Bending Capacity

Moment capacity:
The critical moment is given by:

\[ M_{cr} = C_1 \frac{n^2 EI}{(kL)^2} \left( \frac{(kL)^2 G I_t}{n^2 EI} + (C_2 Z_g)^2 - C_2 Z_g \right) \]

where

- \( C_1 = 2.578 \)
- \( C_2 = 1.554 \)
- \( n^2 EI_{y} = 7,477,200 \)
- \( (kL)^2 \left( \frac{k I_w}{k w} \right)^2 I_w \cdot I_y = 22,394 \)
- \( (kL)^2 G I_t = 23,740 \)
- \( C_2 Z_g = 1.554 \times 160 = 248.6 \)

Therefore, \( M_{cr} = 1,540.6 \text{ kN·m} \)

From the Polish NA, \( \lambda_{LT,0} = 0.4, \beta = 0.75 \)

So, \( \lambda_{LT} = \sqrt{\frac{w y f_y}{M_{cr}}} = \sqrt{\frac{2.149 \times 10^3 \times 275}{1,540.6 \times 10^6}} = 0.619 \)

\[ H/b = 320/300 = 1.067 < 2 \]

So, from Table 6.5 of Eurocode 3, \( a_{LT} = 0.34 \).

From Cl. 6.3.2.3 of Eurocode3:

\[ \Phi_{LT} = 0.5[1+a_{LT} (\lambda_{LT} - \lambda_{LT,0}) + \beta \times \lambda_{LT}^2] = 0.5[1 + 0.34 \times (0.619 - 0.4) + 0.75 \times 0.619^2] = 0.681 \]

So, \( \chi_{LT} = \left( \Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta \lambda_{LT}^2} \right)^{-1} = 0.908 \)

\[ M_B = \frac{\chi_{LT} w y f_y}{y_{M1}} = \frac{0.908 \times 2.149 \times 10^3 \times 275}{1.0} = 536.8 \text{ kN·m} \]

Compression Capacity

Critical compressive values:

- \( N_{cy} = \frac{n^2 EI_{y}}{(kI)^2} = 7,477 \text{ kN} \)
- \( N_{crz} = \frac{n^2 EI_{z}}{(kI)^2} = 24,943 \text{ kN} \)
- \( \lambda_{cy} = \frac{A \times f_y}{N_{cy}} = 0.770 \)
- \( \lambda_{crz} = \frac{A \times f_y}{N_{crz}} = 0.422 \)
Determine $\chi_y$

\[ h/b = 1.067 < 1.2 \quad \text{and} \quad t_f = 20.5 \text{ mm} < 100 \text{ mm} \]

So, for y-y axis, use curve “c”. Hence, $\alpha = 0.49$ [Table 6.2, EC3]

So, $\phi = 0.5[1+\alpha (\lambda - 0.2) +\lambda^2] = 0.936$

\[ \chi_y = \frac{1}{\phi + \sqrt{\phi^2 \cdot \lambda^2}} \times 0.681 \quad \text{(governs)} \]

Determine $\chi_z$

\[ h/b = 1.067 < 1.2 \quad \text{and} \quad t_f = 20.5 \text{ mm} < 100 \text{ mm} \]

So, for z-z axis, use curve “b”. Hence, $\alpha = 0.34$ [Table 6.2, EC3]

So, $\phi = 0.5[1+\alpha (\lambda - 0.2) +\lambda^2] = 0.627$

\[ \chi_z = \frac{1}{\phi + \sqrt{\phi^2 \cdot \lambda^2}} \times 0.917 \quad \text{(does not govern)} \]

Compression capacity:

\[ \chi_y \times N_{Rk} = 0.681 \times 7,477 = 3,020.2 \text{ kN} \]

Compression ratio:

\[ \frac{25 \text{ kN}}{3,020.2 \text{ kN}} = 0.008 \]

Critical Axial Loads for Flexure and Flexural Torsional Buckling

From NCCI document SN001a-EN-FU:

\[ N_{cr,T} = \frac{1}{i_0^2} \left( GI_t + \frac{n^2 EI_w}{i_T^2} \right) \]

where

\[ i_0^2 = i_y^2 + i_z^2 + y_0^2 + z_0^2; \text{ here } y_0 = z_0 = 0 \]

\[ i_y = 75.68 \text{ mm} \text{ and } i_z = 138.23 \text{ mm} \]

\[ = 24,835 \text{ mm}^2 \]

\[ N_{cr,T} = \frac{1}{24,835} \left[ \frac{20,500 \times 225.1(10)^4}{2.6} + \frac{n^2(205,000)(2,069)(10)^{12}}{5,000^2} \right] = 13,889 \text{ kN} \]

\[ N_{cr,TF} = \frac{i_0^2}{2(i_y^2 + i_z^2)} \left[ N_{cr,y} + N_{cr,T} \cdot \sqrt{(N_{cr,y} + N_{cr,T})^2 - 4N_{cr,y}N_{cr,T}i_y^2 + i_z^2} \right] \]

\[ = \frac{1}{2} \left[ 24,943 + 13,889 \cdot \sqrt{(24,943 + 13,889)^2 - 4(24,943)(13,889)} \right] = 13,889 \text{ kN} \]

Interaction Check

From Annex B, Table B.3 of EN 1993:1-1:2005,

\[ W_z = W_{plz} / W_{elz} = 2.149 / 1.926 = 1.116 \]

\[ W_y = W_{ply} / W_{ely} = 939 / 615.9 = 1.525 > 1.5; W_y = 1.5 \]

\[ \psi = 1.0 \]

So, $C_{mx} = 0.6 + 0.4\psi = 1.0$
\[ C_{mLT} = C_{m2} = 1.0 \]
\[ C_{my} = 0.6 + 0.4\psi = 1.0 \]

Interaction factors:

\[ K_{zz} = C_{mz} \left[ 1 + (\lambda_z - 0.2) \frac{N_{Ed}}{x_z \times N_{Rk} \times \gamma M_1} \right] = 1 \left[ 1 + (0.422 - 0.2) \frac{25}{0.681 \times 4, 436} \right] = 1.001 \]
\[ K_{yy} = C_{my} \left[ 1 + (2\lambda_y - 0.6) \frac{N_{Ed}}{x_y \times N_{Rk} \times \gamma M_1} \right] = 1 \left[ 1 + (2 \times 0.770 - 0.6) \frac{25}{0.681 \times 4, 436} \right] = 1.008 \]
\[ K_{yz1} = 0.6K_{zz} = 0.601 \]
\[ K_{yz2} = 1 + \frac{0.1 \times \lambda_y}{C_{mLT} - 0.25} \frac{N_{Ed}}{x_y \times N_{Rk} \times \gamma M_1} = 1 \cdot \frac{0.1 \times 0.770}{(1 - 0.25)} \frac{25}{0.681 \times 4, 436} = 0.999 \]

So, \( K_{yz} = \text{maximum}(K_{yz1}, K_{yz2}) = 0.999 \)

\[ K_{xy} = 0.6 \times K_{yy} = 0.6(1.008) = 0.605 \]

Check for Clause 6.3.3-661:

\[ \frac{N_{Ed}}{N_{Rk}^{\frac{1}{M_1}}} + K_{ZZ} \frac{M_{z,Ed}}{M_{z,Rk}^{\frac{1}{M_1}}} + K_{ZY} \frac{M_{y,Ed}}{M_{y,Rk}^{\frac{1}{M_1}}} = \frac{25}{0.9174 \times 4,436} + 1.001 \frac{10}{1.0 \times 591} + 0.605 \frac{5}{258.3} = 0.035 \]

Check for Clause 6.3.3-662:

\[ \frac{N_{Ed}}{N_{Rk}^{\frac{1}{M_1}}} + K_{YZ} \frac{M_{z,Ed}}{M_{z,Rk}^{\frac{1}{M_1}}} + K_{YY} \frac{M_{y,Ed}}{M_{y,Rk}^{\frac{1}{M_1}}} = \frac{25}{0.6809 \times 4,436} + 0.999 \frac{10}{1.0 \times 591} + 1.008 \frac{5}{258.3} = 0.045 \]

Check for PN-NA 20.2

About the Z-Z axis:

\[ \eta = \frac{N_{Ed}}{N_{Rd}} = \frac{25 \text{kN}}{4,436 \text{kN}} = 0.0056 \]
\[ m_z = \frac{M_{z,Ed}}{M_{z,Rd}} = \frac{10 \text{kN m}}{591 \text{kN m}} = 0.0169 \]
\[ m_y = \frac{M_{y,Ed}}{M_{y,Rd}} = \frac{5 \text{kN m}}{258.3 \text{kN m}} = 0.0194 \]
\[ \Delta_0 = 0.1 + 0.2 \left( \frac{W_{plz}}{W_{elz}} - 1 \right) = 0.1 + 0.2(1.116 - 1) = 0.123 \]

Per the Polish NA, the following must be satisfied:

\[ \frac{\eta}{x_z} + \frac{C_{mz} \times m_z}{x_{LT}} + C_{my} \times m_y \leq 1 \cdot \Delta_0 \]
\[ 0.0056 \frac{0.917}{0.908} + 0.0169 \leq 0.123 = 0.877 \]

The ratio of the inequality sides is then: \( 0.044 / 0.877 = 0.050 \)

About the Y-Y axis:
\[ \Delta_0 = 0.1 + 0.2 \left( \frac{W_{pl}}{W_{el}} \times 1 \right) = 0.1 + 0.2(1.525 \times 1) = 0.205 \]

Per the Polish NA, the following must be satisfied:

\[ \frac{\eta}{x_y} + \frac{C_{my} \times m_y}{\lambda_{LT}} + C_{mz} \times m_y \leq 1 \cdot \Delta_0 \]

\[ \frac{0.0056}{0.6809} + \frac{1 \times 0.0194}{0.908} + 1 \times 0.0169 = 0.046 \leq 1 \cdot 0.20 = 0.80 \]

The ratio of the inequality sides is then: \( 0.046 / 0.80 = 0.058 \)

V. EC3 Polish NA - I Section with Conc Load

Calculate the bending capacity of a beam subject to a concentrated load per the Polish NA to EC3.

Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, fixed-fixed span subject to a 30 kN concentrated load at midspan.

Validation

Moment capacity:

\[ M_{chk} = \frac{P_{flyy}}{\gamma_M} = \frac{2,149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN·m} \]

The critical moment is given by:

\[ M_{cr} = C_1 \left( \frac{n^2EI_y}{(kL)^2} \right) \left( \frac{k}{k_w} \right) \left( \frac{I_w}{I_y} \right) + \left( \frac{(kL)^2GIt}{n^2EI_y} \right) + \left( C_2Z_g \right)^2 - C_2Z_g \]

where

- \( C_1 = 1.683 \)
- \( C_2 = 1.645 \)
- \( n^2EI_y = 7,477,200 \)
- \( \frac{(kL)^2}{(kL)^2} = \frac{22,394}{\frac{I_w}{I_y}} \)
- \( \frac{(kL)^2GIt}{n^2EI_y} = 23,737 \)
- \( C_2Z_g = 1.645 \times 160 = 263.2 \)

Therefore, \( M_{cr} = 962.9 \text{ kN·m} \)

From the Polish NA, \( \lambda_{LT,0} = 0.4, \beta = 0.75 \)

So, \( \lambda_{LT} = \sqrt{\frac{w_{flyy}M_{cr}}{M_{cr}}} = \sqrt{\frac{2,149 \times (10)^3 \times 275}{962.9 \times (10)^6}} = 0.783 \)
H/b = 320/300 = 1.067 < 2
So from Table 6.3 of Eurocode 3, $a_{LT} = 0.21$.

From Cl. 6.3.2.2 of Eurocode 3:

$$\Phi_{LT} = 0.5 \left[ 1 + a_{LT} (\lambda_{LT} - 0.2) + \lambda_{LT}^2 \right] = 0.5 \left[ 1 + 0.21 (0.783 - 0.2) + (0.783)^2 \right] = 0.868$$

So, $X_{LT} = \left( \Phi_{LT} + \sqrt{\Phi_{LT}^2 - \lambda_{LT}^2} \right)^{-1} = \frac{1}{0.868 + \sqrt{(0.868)^2 - (0.783)^2}} = 0.805$

$$M_B = \frac{x_{LT}w_yf_y}{\gamma_{M1}} = \frac{0.805 \times 2.149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 475.7 \text{ kN·m}$$

V.09 Steel Design

STAAD.Pro

User Manual
** RELATED LINKS**

- **D5.D.8 Polish National Annex to EC3**(on page 1543)

**V. EC3 Polish NA - I Section with UDL**

Calculate the bending capacity of a beam using an I section subject to a uniformly distributed load per the Polish NA to EC3.

**Details**

The section is a HD320X127, Grade S275 steel. The member is a 5 m, fixed-fixed span subject to a 10 kN/m uniform load.

**Validation**

Moment capacity:

\[
M_{ekd} = \frac{W_{pl} f_y}{\gamma_M} = \frac{2.149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN·m}
\]
The critical moment is given by:

\[ M_{cr} = C_1 \frac{n^2 EI_y}{(kL)^2} \left[ \left( \frac{k}{k'} \right)^2 \frac{I_w}{I} + \frac{(kL)^2 G I}{n^2 EI_y} + \left( C_2 Z_g \right)^2 - C_2 Z_g \right] \]

where

\[ C_1 = 2.578 \]
\[ C_2 = 1.554 \]
\[ \frac{n^2 EI_y}{(kL)^2} = 7,477,200 \]
\[ \frac{\left( \frac{k}{k'} \right)^2 \frac{I_w}{I}}{I_w} = 22,394 \]
\[ \frac{(kL)^2 G I}{n^2 EI_y} = 23,737 \]
\[ C_2 Z_g = 1.554 \times 160 = 248.6 \]

Therefore, \( M_{cr} = 1,539 \, \text{kN} \cdot \text{m} \)

From the Polish NA, \( \lambda_{LT, \theta} = 0.4, \beta = 0.75 \)

So, \( \lambda_{LT} = \sqrt{\frac{w_y f_y}{M_{cr}}} = \sqrt{\frac{2.149 \times (10)^2 \times 275}{1,539 \times (10)^6}} = 0.620 \)

\( H/b = 320/300 = 1.067 < 2 \)

So, from Table 6.5 of Eurocode 3, \( a_{LT} = 0.34 \) (buckling curve “b”)

From Cl. 6.3.2.3 of Eurocode 3:

\[ \Phi_{LT} = 0.5 \left[ 1 + a_{LT} \left( \lambda_{LT} \cdot \lambda_{LT, \theta} \right) + \beta \times \lambda_{LT}^2 \right] = 0.5 \left[ 1 + 0.34 \left( 0.620 - 0.4 \right) + 0.75 \times (0.620)^2 \right] = 0.681 \]

So, \( \chi_{LT} = \left( \Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta \times \lambda_{LT}^2} \right)^{-1} = \frac{1}{0.681 + \sqrt{(0.681)^2 - 0.75(0.620)^2}} = 0.908 \)

For the Polish NA, the value of \( k_c \) is evaluated as:

\[ k_c = \sqrt{C_{mLT}} \]

where

\[ a_s = M_s / M_h = -10.42 / 20.83 = -0.5 \text{ for } -1 \leq a_s \leq 1; \text{ per Table B.3 of Annex B of EC3.} \]
\[ \psi = 1 \text{ for } 0 \leq \psi \leq 1 \]
\[ C_{mLT} = 0.1 - 0.8 \times a_s = 0.5 > 0.4, \text{ thus use } C_{mLT} = 0.5 \]

So, \( k_c = \sqrt{0.5} = 0.707 \)

Modification factor: \( f = 1 - 0.5 \left( 1 - k_c \right) \left[ 1 - 2 \left( \lambda_{LT} \cdot 0.8 \right)^2 \right] = 1 - 0.5 \left( 1 - 0.707 \right) \left[ 1 - 2(0.620 \cdot 0.8)^2 \right] = 0.863 \)

\[ X_{LT, \text{mod}} = \frac{X_{LT}}{f} = \frac{0.908}{0.863} = 1.05 > 1, \text{ thus use } X_{LT, \text{mod}} = 1 \]

\[ M_B = \frac{X_{LT} w_y f_y}{y_{M1}} = \frac{1.0 \times 2.149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591 \, \text{kN} \cdot \text{m} \]
## Results

### STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 Polish NA-I Section with UDL.std` is typically installed with the program.

The following **D5.C.6 Design Parameters** (on page 1493) are used:

- The Polish NA is specified using NA 6
- Uniformly distributed load w/ fixed-fixed supports: CMM 2
- The value of C2 1.554 is specified
- The yield strength is directly specified by PY 275000.

V. EC3 Singapore NA - Channel Section with Conc Load

Calculate the bending capacity of a channel section beam under subject to a pair of concentrated load per the Singaporean NA to EC3

Details

The section is a C15X50, grade S275 steel. The member is a 6 m span, simply supported beam is subject to two concentrated loads of 10 kN each at the 1/3 points (2 m from either support).

Validation

Moment capacity:

\[ M_{ckd} = \frac{W_{f}f_{y}}{n_{M0}} = \frac{1.128(10)^{2}275}{1.0(10)^{6}} = 308.7 \text{ kN m} \]

The critical moment is given by:

\[ M_{cr} = C_{1}\left(\frac{k_{L}}{k_{w}}\right)^{2}\left(\frac{I_{w}}{I_{z}}\right)\left[\frac{2}{T_{z}} + \frac{(k_{L})^{2}G_{I_{L}}}{n^{2}E_{I_{y}}} + (C_{2}Z_{g} \cdot C_{3}Z_{j})^{2} - (C_{2}Z_{g} \cdot C_{3}Z_{j})\right] \]

where

\[
\begin{align*}
C_{1} &= 1.046 \\
C_{2} &= 0.42 \\
C_{3} &= 1.0 \\
n^{2}E_{I_{y}} &= 257,320 \\
\left(\frac{hL}{k_{w}}\right)^{2} &= 28,852 \\
\left(\frac{k_{L}}{k_{w}}\right)^{2}\frac{I_{w}}{T_{y}} &= 315,300 \\
C_{2}Z_{g} &= 0.42 \times 0.5 \times 381 = 80.01
\end{align*}
\]
\[ \beta_f = \frac{b c^3 + t_c}{b c^3 + t_c + b t^3 + t_t} = 0.5 \text{ (From SN030a-EN-EU)} \]

\[ z_j = \frac{0.4 \times h_s (2 \beta_f - 1)}{C_2 Z_j} = 0 \text{ for } \beta_f \geq 0.5 \]

Therefore, \( M_{cr} = 1.046 \times 257,320 \left[ \sqrt{28,852 + 315,270 + (80.01)^2 - (80.01)} \right] = 137.8 \text{ kN m} \)

**V. EC3 Singapore NA - Column with Axial Load**

Calculate the axial and bending capacities and interaction ratios of a column using the Singaporean NA to EC3.

---

**Details**

The 5 m tall column as a fixed base and is free to translate and rotate at the top. The column is subject to a 25 kN compressive load and moments of 5 kN·m about the X axis and 10 kN·m about the Z axis. The section is an HD320X127, grade S275 steel.

---

**Validation**

**Bending Capacity**

Moment capacity:

\[
M_{cd} = \frac{W_{p} f_{y} I_{y}}{y_{M_{0}}} = \frac{2.149(10)^{3}275}{1.0(10)^{3}} = 591.0 \text{ kN·m}
\]

The critical moment is given by:

\[
M_{cr} = C_{1} \frac{n^{2}EI}{(kL)^{2}} \left[ \left( \frac{k}{f_{w}} \right)^{2} I_{w} + \frac{(kL)^{2}G_{I}}{n^{2}EI} + (C_{2}Z_{g})^{2} - C_{2}Z_{g} \right]
\]

**V. EC3 Singapore NA - Column with Axial Load**

Calculate the axial and bending capacities and interaction ratios of a column using the Singaporean NA to EC3.

---

**Details**

The 5 m tall column as a fixed base and is free to translate and rotate at the top. The column is subject to a 25 kN compressive load and moments of 5 kN·m about the X axis and 10 kN·m about the Z axis. The section is an HD320X127, grade S275 steel.

---

**Validation**

**Bending Capacity**

Moment capacity:

\[
M_{cd} = \frac{W_{p} f_{y} I_{y}}{y_{M_{0}}} = \frac{2.149(10)^{3}275}{1.0(10)^{3}} = 591.0 \text{ kN·m}
\]

The critical moment is given by:

\[
M_{cr} = C_{1} \frac{n^{2}EI}{(kL)^{2}} \left[ \left( \frac{k}{f_{w}} \right)^{2} I_{w} + \frac{(kL)^{2}G_{I}}{n^{2}EI} + (C_{2}Z_{g})^{2} - C_{2}Z_{g} \right]
\]
where

\[
\begin{align*}
C_1 &= 2.578 \\
C_2 &= 1.554 \\
n^2EI_y &= 7,477,200 \\
\frac{(kL)^2}{(k_w)^2} &= 22,394 \\
\frac{\left(\frac{k}{k_w}\right)^2I_w}{I_y} &= 23,740 \\
\frac{n^2EI_y}{C_2Z_g} &= 1.554 \times 160 = 248.6
\end{align*}
\]

Therefore, \(M_{cr} = 1,540.6 \text{ kN·m}\)

From the Singaporean NA, \(\lambda_{LT, \theta} = 0.4\), \(\beta = 0.75\)

So, \(\lambda_{LT} = \frac{w_y f_y}{M_{cr}} = \sqrt{\frac{2,149 \times 10^3 \times 275}{1,540.6 \times 10^6}} = 0.619\)

\(H/b = 320/300 = 1.067 < 2\). So, from Table 6.5 of Eurocode 3, \(\alpha_{LT} = 0.34\).

From Cl. 6.3.2.3 of Eurocode3:

\[
\Phi_{LT} = 0.5[1 + \alpha_{LT} (\lambda_{LT} - \lambda_{LT, \theta}) + \beta \lambda_{LT}^2] = 0.5[1 + 0.34 \times (0.619 - 0.4) + 0.75 \times 0.619^2] = 0.681
\]

So, \(X_{LT} = \left(\Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta \lambda_{LT}^2}\right)^{-1} = 0.908\)

So, \(k_c = 1 / \sqrt{C_1} = 1 / \sqrt{2.578} = 0.623\) and thus modification factor, \(f = 0.824\)

\(X_{LT, mod} = X_{LT} / f = 1.10 > 1\), thus use \(X_{LT} = 1\)

\[
M_B = \frac{x_{LT} w_y f_y}{y_{M1}} = \frac{1.0 \times 2,149(10)^3 \times 275}{1.0} = 591.0 \text{ kN·m}
\]

**Compression Capacity**

Critical compressive values:

\[
\begin{align*}
N_{cry} &= \sqrt{\frac{n^2EI_y}{(kl)^2}} = 7,477 \text{ kN} \\
N_{crz} &= \sqrt{\frac{n^2EI_z}{(kl)^2}} = 24,943 \text{ kN} \\
\lambda_{cy} &= \frac{A \times f_y}{N_{cry}} = 0.770 \\
\lambda_{cz} &= \frac{A \times f_y}{N_{crz}} = 0.422
\end{align*}
\]

Determine \(\chi_y\)

\(h/b = 1.067 < 1.2\) and \(t_f = 20.5 \text{ mm} < 100 \text{ mm}\)

So, for y-y axis, use curve "c". Hence, \(\alpha = 0.49\) [Table 6.2, EC3]
So, $\phi = 0.5[1+\alpha (\lambda - 0.2) +\lambda^2] = 0.936$

$x_y = \frac{1}{\phi + \sqrt{\phi^2 - \lambda^2}} 0.681$ (governs)

Determine $x_z$

$h/b = 1.067 < 1.2$ and $t_f = 20.5 \text{ mm} < 100 \text{ mm}$

So, for $z$-$z$ axis, use curve “b”. Hence, $\alpha = 0.34$ [Table 6.2, EC3]

So, $\phi = 0.5[1+\alpha (\lambda - 0.2) +\lambda^2] = 0.627$

$x_z = \frac{1}{\phi + \sqrt{\phi^2 - \lambda^2}} 0.917$ (does not govern)

Compression capacity:

$X_y \times N_{Rk} = 0.681 \times 7,477 = 3,020.2 \text{ kN}$

Compression ratio: $25 \text{ kN} / 3,020.2 \text{ kN} = 0.008$

Critical Axial Loads for Flexure and Flexural Torsional Buckling

From NCCI document SN001a-EN-FU:

$$N_{cr,T} = \frac{1}{2} \left( GI_t + \frac{n^2EI_w}{I_T^2} \right)$$

where

$$i_0^2 = i_y^2 + i_z^2 + y_0^2 + z_0^2; \text{ here } y_0 = z_0 = 0$$

$i_y = 75.68 \text{ mm}$ and $i_z = 138.23 \text{ mm}$

$= 24,835 \text{ mm}^2$

$$N_{cr,T} = \frac{1}{24,835} \left[ \frac{20,500 \times 225.1(10)^4}{2.8} + \frac{n^2(205,000)(2.069)(10)^{12}}{5,000^2} \right] = 13,889 \text{ kN}$$

$$N_{cr,TF} = \frac{i_0^2}{2(i_y^2 + i_z^2)} [N_{cr,y} + N_{cr,T} \cdot [\left[N_{cr,y} + N_{cr,T}\right]^2 - 4N_{cr,y}N_{cr,T} i_y^2 + i_z^2]^{1/2}]$$

$$= \frac{1}{2} \left[ 24,943 + 13,889 - \sqrt{24,943 + 13,889}^2 - 4(24,943)(13,889)^{1/2} \right] = 13,889 \text{ kN}$$

Interaction Check

From Annex B, Table B.3 of EN 1993:1-1:2005,

$$W_z = W_{plz} / W_{elz} = 2.149 / 1.926 = 1.116$$

$$W_y = W_{ply} / W_{ely} = 939 / 615.9 = 1.525 > 1.5; W_y = 1.5$$

$\psi = 1.0$

So, $C_{mz} = 0.6 + 0.4\psi = 1.0$

$C_{mLT} = C_{mz} = 1.0$

$C_{my} = 0.6 + 0.4\psi = 1.0$

Interaction factors:
\[
K_{zz} = C_m \left[ 1 + \lambda_z \frac{N_{Ed}}{X_z N_{Rk} \gamma_{M1}} \right] = 1 + (0.422 - 0.2) \frac{25}{0.681 \times 4, 436} = 1.001
\]
\[
K_{yy} = C_m \left[ 1 + 2 \lambda_y - 0.6 \frac{N_{Ed}}{X_y N_{Rk} \gamma_{M1}} \right] = 1 + (2 \times 0.770 - 0.6) \frac{25}{0.681 \times 4, 436} = 1.008
\]
\[
K_{yz1} = 0.6K_{zz} = 0.601
\]
\[
K_{yz2} = 1 + \frac{0.1 \lambda_y}{C_{mLT} - 0.25} \frac{N_{Ed}}{X_y N_{Rk} \gamma_{M1}} = 1 \cdot \frac{0.1 \times 0.770}{(1 - 0.25) \times 0.681 \times 4, 436} = 0.999
\]
So, \( K_{yz} = \max(K_{yz1}, K_{yz2}) = 0.999 \)
\[
K_{xy} = 0.6 \times K_{yy} = 0.6(1.008) = 0.605
\]

Check for Clause 6.3.3-661:
\[
\frac{N_{Ed}}{X_z N_{Rk} \gamma_{M1}} + K_{zz} \frac{M_z, Ed}{M_z, Rk} + K_{yy} \frac{M_y, Ed}{M_y, Rk} = \frac{25}{0.9174 \times 4, 436} + 1.001 \frac{10}{1.0 \times 591} + 0.605 \frac{5}{258.3} = 0.035
\]
Check for Clause 6.3.3-662:
\[
\frac{N_{Ed}}{X_y N_{Rk} \gamma_{M1}} + K_{yz} \frac{M_z, Ed}{M_z, Rk} + K_{yy} \frac{M_y, Ed}{M_y, Rk} = \frac{25}{0.6809 \times 4, 436} + 0.999 \frac{10}{1.0 \times 591} + 1.008 \frac{5}{258.3} = 0.045
\]

Results

BUCKLING CALCULATIONS (units - kN,m)
V. EC3 Singapore NA - I Section with Conc Load

Calculate the bending capacity of a beam subject to a concentrated load per the Singaporean NA to EC3.

Details
The section is a HD320X127, Grade S275 steel. The member is a 5 m, simply-supported span subject to a 30 kN concentrated load at midspan.

Validation
Moment capacity:

\[ M_{ckd} = \frac{W_{pl} f_y}{\gamma_M} = \frac{2.149 \times (10)^{3.3} \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN m} \]

The critical moment is given by:

\[ M_{cr} = C_1 \frac{n^2EI}{(kL)^2} \left[ \left( \frac{k}{k_w} \right)^2 \frac{I_w}{T} + \frac{(kL)^2GI_t}{n^2EI} + (C_2Z_g)^2 - C_2Z_g \right] \]

where

\[ C_1 = 1.348 \]
\[ C_2 = 0.63 \]
\[ n^2EI_y = 7,477,200 \]
\[ \frac{(kL)^2}{k_w} \left( \frac{k}{k_w} \right)^2 \frac{I_w}{T_y} = 22.394 \]
\[
\frac{(kL)^2GI_t}{n^2EI_y} = 23,737
\]
\[
C_2Z_g = 0.63 \times 160 = 100.8
\]

Therefore, \(M_{cr} = 1,375 \text{ kN•m}\)

From the Singaporean NA, \(\lambda_{LT, 0} = 0.4, \beta = 0.75\)

So, \(\lambda_{LT} = \sqrt{\frac{\frac{w_yf_y}{M_{cr}}}{1}} = \sqrt{\frac{2,149 \times (10)^3 \times 275}{1,375 \times (10)^6}} = 0.656\)

\(H/b = 320/300 = 1.067 < 2\). So, from Table 6.5 of Eurocode 3, \(a_{LT} = 0.34\).

From Cl. 6.3.2.3 of Eurocode3:

\[
\Phi_{LT} = 0.5[1 + a_{LT} (\lambda_{LT} - \lambda_{LT, 0}) + \beta \lambda_{LT}^2] = 0.5[1 + 0.34 \times (0.656 - 0.4) + 1 \times 0.656^2] = 0.705
\]

So, \(X_{LT} = \Phi_{LT} + \Phi_{LT}^2 - \beta \lambda_{LT}^2 = 1 + 0.656 = 0.861\) but this value cannot be used, so from Table 6.6 of the Eurocode 3, \(k_c = 0.9\)

Modification factor: \(f = 1 - 0.5(1 - 0.861) \times [1 - 2(0.656 - 0.8)^2] = 0.934\)

\[
X_{LT, mod} = \frac{X_{LT}}{f} = 0.955 < \frac{1}{\lambda_{LT}^2} = 2.897, \text{OK}
\]

\[
M_B = \frac{X_{LT}w_yf_y}{Y_{M1}} = \frac{0.955 \times 2,149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 564.3 \text{ kN•m}
\]

V. EC3 Singapore NA - I Section with UDL

Calculate the bending capacity of a beam using an I section subject to a uniformly distributed load per the Singaporean NA to EC3.
Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, fixed-fixed span subject to a 10 kN/m uniform load.

Validation

Moment capacity:

\[ M_{ckd} = \frac{W_{pl} f_y}{\gamma_{M0}} = \frac{2.149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN m} \]

The critical moment is given by:

\[ M_{cr} = C_1 \frac{n^2 EI}{(kL)^2} \left\{ \left( \frac{k}{k_w} \right)^2 \frac{I_w}{I} + \frac{(kL)^2 G I_t}{n^2 EI} \left( C_2 Z_g \right)^2 - C_2 Z_g \right\} \]

where

- \( C_1 = 0.712 \)
- \( C_2 = 0.652 \)
- \( k = 0.5 \)
- \( n^2 EI_y = 29,909,000 \)
- \( (kL)^2 = 5,599 \)
- \( (kL)^2 G I_t = 5,934 \)
- \( C_2 Z_g = 0.652 \times 160 = 104.3 \)

Therefore, \( M_{cr} = 966.7 \text{ kN m} \)

From the Singaporean NA, \( \lambda_{LT,0} = 0.4, \beta = 0.75 \)

So, \( \lambda_{LT} = \sqrt{\frac{w f y}{M_{cr}}} = \sqrt{\frac{2.149 \times (10)^3 \times 275}{966.7 \times (10)^6}} = 0.782 \)

\( H/b = 320/300 = 1.067 < 2 \) So, from Table 6.5 of Eurocode 3, \( a_{LT} = 0.34 \).

From Cl. 6.3.2.3 of Eurocode3:

\( \Phi_{LT} = 0.5[1 + a_{LT} (\lambda_{LT} - \lambda_{LT,0}) + 8 \times \lambda_{LT}^2] = 0.5[1 + 0.34 \times (0.782 - 0.2) + 1 \times 0.782^2] = 0.794 \)

So, \( \chi_{LT} = (\Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta \lambda_{LT}^2}) - 1 = 0.827 \)

Then, \( k_c = 1 / \sqrt{C_1} = 1 / \sqrt{0.712} = 1.182 > 1 \) but this value cannot be used, so from Table 6.6 of Eurocode 3, \( k_c = 0.9 \)

Modification factor: \( f = 1 \times 0.5(1 - k_c) [1 - 2 (\lambda_{LT} - 0.8)^2] = 1 \times 0.5(1 - 0.9)[1 - 2(0.782 - 0.8)^2] = 0.950 \)

\( X_{LT, mod} = \frac{X_{LT w y f y}}{\gamma_{M1}} = 0.871 < \frac{1}{\lambda_{LT}^2} = 1.635, \text{OK} \)

\[ M_B = \frac{X_{LT w y f y}}{\gamma_{M1}} = \frac{0.871 \times 2.149(10)^3 \times 275}{1.0} = 514.4 \text{ kN m} \]
If Cl. 6.3.2.2 is used to determine $\chi_{LT}$:

$$H/b = \frac{320}{300} = 1.067 < 2.$$ So, from Table 6.3 of Eurocode 3, $\alpha_{LT} = 0.21$. 

$$\Phi_{LT} = 0.5[1 + \alpha_{LT}(\lambda_{LT} - 0.2) + \lambda_{LT}^2] = 0.5[1 + 0.21 \times (0.782 - 0.2) + 1 \times 0.782^2] = 0.867.$$ (Cl. 6.3.2.2)

$$X_{LT} = \left( \frac{\Phi_{LT}}{\lambda_{LT}} + \sqrt{\Phi_{LT}^2 - \lambda_{LT}^2} \right)^{-1} = 0.806$$

$$M_B = \frac{X_{LT} w y f y}{y_{M1}} = \frac{0.806 \times 2.149 \times 10^3 \times 275}{1.0 \times 10^6} = 476.3 \text{ kN} \cdot \text{m}$$

**STAAD.Pro Input**

The file C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 Singapore NA-I Section with UDL.std is typically installed with the program.

The following *D5.C.6 Design Parameters* (on page 1493) are used:

- The Singaporean NA is specified using NA 7
- Fully fixed span: CMN 0.5
- Uniformly distributed load w/ fixed-fixed supports: CMM 2
- The parameter KC instructs the program to calculate the value of $k_c$
- A second design parameter set is used with MTH 1 to use Cl 6.3.2.2 to determine $\Phi_{LT}$

**Note:** The previously set parameters are still used as they are not specified again with a different value, which is the default behavior in STAAD.Pro batch design.

- **D5.D.9 Singaporean National Annex to EC3** (on page 1549)

**V. EC3 Singapore NA - Tee Section**

Calculate the bending capacity of a beam using a Tee section subject to a uniformly distributed load and varying end moments per the Singaporean NA to EC3.

**Details**

The section is an Indian INST100 with \( f_y = 300 \text{ MPa} \). The member is a 5 m, simply-supported span under a 2 kN/m uniform load. The left support has a -5.0 kN·m moment applied and the right support has a 2.5 kN·m moment applied.

**Validation**

Moment capacity:

\[
M_{ckd} = \frac{W_{ply} f_y}{\gamma_M 0} = \frac{45.5 \times (10)^3 \times 300}{1.0 \times (10)^6} = 13.7 \text{ kN m}
\]

The critical moment is given by:

\[
M_{cr} = C_1 \frac{n^2 E I_y}{(k_z L)^2} \left[ \frac{2 T_w}{I_w} + \left( \frac{k_z L}{n^2 E I_z} \right)^2 G_I T \right] \left( C_2 Z_g - C_3 Z_j \right)^2 - \left( C_2 Z_g - C_3 Z_j \right)^2
\]

where

\[
C_1 = 1.0 \\
C_2 = 1.0 \\
C_3 = 1.0 \\
n^2 E I_y = 64,421 \\
\frac{(k L)^2}{(k z L)^2} = \frac{2}{I_w} = \frac{30.76}{79.6} = 0.386 \\
\frac{(k L)^2 G_I T}{n^2 E I_y} = \frac{(1 \times 5,000)^2 \times 205,000 \times 7.33 \times (10)^4}{2.6 \times n^2 \times 205,000 \times 79.6 \times (10)^4} = 89,714 \\
C_2 Z_g = 1.0 \times 10 / 2 = 5 \\
\Psi_f = 1 (I_t = 0, as there is no tension flange present in the Tee section) \\
h_s = D - 0.5 \times t_f = 100 - 0.5 \times 10 = 95 \text{ mm} \\
z_j = 0.8 \times \Psi_f h_s / 2 = 0.8 \times 1 \times 95 / 2 = 38 \text{ mm} \\
C_3 Z_j = 1.0 \times 38 = 38
\]

Therefore, \( M_{cr} = 1.0 \times 64,421 \left[ 0.386 + 89,714 + (5 - 38)^2 \cdot (5 - 38) \right] = 21.5 \text{ kN m} \)

STAAD.Pro Input

The file C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 Singapore NA-Tee Section.std is typically installed with the program.

The following D5.C.6 Design Parameters (on page 1493) are used:

- The Singaporean NA is specified using NA 7
- Simply-supported span: CMN 1.0
- Varying end moments and a uniformly distributed load: CMM 7
- The values of C1 1.0, C2 1.0, and C3 1.0 are specified

**Note:** Since these parameters are specified, MU is not specified as it would be ignored in favor of the direct coefficient specifications. Refer to D5.D.10.2 Clause 6.3.2.2 – Elastic critical moment and imperfection factors for LTB checks (on page 1557) for additional details.

- D5.D.9 Singaporean National Annex to EC3 (on page 1549)

V. EC3 Singapore NA - Varying End Mom CMM8

Calculate the bending capacity of a beam using an I section subject to a concentrated load and varying end moments per the Singaporean NA to EC3.

Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, simply-supported span subject to a 10 kN/m uniform load. The left support has a -10.0 kN·m moment applied and the right support has a 8.0 kN·m moment applied.

Validation

Moment capacity:

\[ M_{ckd} = \frac{W_{pl} f_{y}}{\gamma_{M0}} = \frac{2.149 \times (10)^{3} \times 275}{1.0 \times (10)^{6}} = 591.0 \text{ kN} \cdot \text{m} \]

The critical moment is given by:

\[ M_{cr} = C_{1} \frac{n^{2} EI}{(kL)^{2}} \left\{ \left( \frac{k}{k_{w}} \right)^{2} + \frac{(kL)^{2} GI_{t}}{n^{2} EI} + (C_{2}Z_{g})^{2} - C_{2}Z_{g} \right\} \]

where
\[ k_w = k = 1 \]
\[ n^2EI_y = 7,477,200 \]
\[ \frac{1}{(kL)^2} = 22,394 \]
\[ \frac{1}{(kL)^2}GIt = 23,737 \]
\[ C_2Z_g = 0.17 \times 160 = 27.2 \]
\[ \mu = \frac{FL}{4M} = \frac{4 \times 5}{4 \times 10} = 0.5 > 0 \]

From the graph, \( C_1 = 1.184, C_2 = 0.17 \)
\[ C_2Z_g = 0.17 \times 160 = 27.2 \]

Therefore, \( M_{cr} = 1,676 \text{ kN m} \)

V. India

V. IS 800 2007 LSD - Angle - Flexural Torsional Buckling

Verify the design of a single angle subject to axial compress per the IS 800:2007 limit state method.

References

BIS. IS 808: Dimensions for Hot Rolled Steel Beam, Column, Channel, and Angle Sections. 1898. New Delhi. p.12

Related Links
Details

The member is a 2.5 m long cantilever subject to a 100 kN compressive force. The section used is a ISA 150x115x16. The steel has a yield strength of 250 MPa, an ultimate tensile strength of 420 MPa, a modulus of elasticity of 205×(10)^3 MPa, and a Poisson’s ratio of 0.3.

Section Properties

From IS: 808-1989, Table 6.1:

\[
\begin{align*}
A_x &= 40 \text{ cm}^2 \\
c_z &= 3.07 \text{ cm} \\
c_y &= 4.81 \text{ cm} \\
I_x &= 878 \text{ cm}^4 \\
I_y &= 447 \text{ cm}^4 \\
r_u &= 5.21 \text{ cm} \\
r_y &= 2.44 \text{ cm}
\end{align*}
\]

Validation

Check for axial compression about the major principal axis

The non-dimensional slenderness ratio,

\[
\lambda_z = \sqrt{\frac{f_y}{n^2 EI_x}} = \sqrt{\frac{250(1.0 \times 250)^2}{n^2 205,000}} 0.533
\]

Per Table 10, buckling class is “c” for an angle section. Per Table 7, for buckling class “c”, \(a = 0.49\)

\[
\phi_z = 0.5\left[1 + a(\lambda_z - 0.2) + \lambda_z^2\right] = 0.5\left[1 + 0.49(0.533 - 0.2) + (0.533)^2\right] = 0.724
\]

\[
\chi_z = \left(\phi_z + \sqrt{\phi_z^2 - \lambda_z^2}\right)^{-1} = \frac{1}{0.724 + \sqrt{(0.724)^2 - (0.533)^2}} = 0.825
\]

\[
f_{cdz} = \frac{x_z \times f_y}{\gamma_m} = \frac{0.825 \times 250(10)^6}{1.1} = 187.4 \text{ MPa}
\]

(Cl. 7.1.2.1)

The axial compression capacity with respect to the major principal axis is:

\[
P_{dz} = A_x \times f_{cdz} = 40(10)^2 \text{ cm}^2 \times 187.4 \text{ MPa}(10)^{-3} = 749.7 \text{ MPa}
\]

Check for axial compression about the minor principal axis

The non-dimensional slenderness ratio,

\[
\lambda_y = \sqrt{\frac{f_y}{n^2 EI_y}} = \sqrt{\frac{250(1.0 \times 250)^2}{n^2 205,000}} 1.139
\]

\[
\phi_y = 0.5\left[1 + a(\lambda_y - 0.2) + \lambda_y^2\right] = 0.5\left[1 + 0.49(1.139 - 0.2) + (1.139)^2\right] = 1.379
\]
\[ X_y = \left( \phi_y + \sqrt{\phi_y^2 - \lambda_y^2} \right)^{-1} = \frac{1}{1.379 + \sqrt{1.139^2 - 0.092^2}} = 0.464 \]  
\[ f_{cdy} = \frac{X_y \times f_y}{\gamma_{m0}} = \frac{0.464 \times 250(10)^6}{1.1} = 105.4 \text{ MPa} \]  
(Cl. 7.1.2.1)

The axial compression capacity with respect to the minor principal axis is:

\[ P_{dy} = A_x \times f_{cdy} = 40(10)^2 \text{ cm}^2 \times 105.4 \text{ MPa}(10)^{-3} = 421.8 \text{ MPa} \]

Check for axial compression against flexural torsional buckling

Since the member being design is an angle loaded through one leg, the axial compression capacity with respect to flexural torsional buckling must be checked. The end connection has two or more bolts (or is welded) and is assumed to be unrestrained (“hinged”). Therefore, from Table 12: \( k_1 = 0.7, k_2 = 0.6, \) and \( k_3 = 5. \)

\[ \lambda_e = k_1 + k_2 \times \lambda_{vv}^2 + k_3 \times \phi^2 \]  
(Cl. 7.5.1.2)

\[ \varepsilon = \sqrt{250} / f_y = 1 \]

\[ \phi = \frac{(b + d) / 2t}{\sqrt{\frac{n^2 \times E}{250}}} = \frac{(150 + 115) / (2 \times 16)}{1.0 \sqrt{\frac{n^2 \times 205,000}{250}}} = 0.092 \]

\[ \lambda_{vv} = \frac{L / t_y}{\sqrt{\frac{n^2 \times E}{250}}} = \frac{250 / 2.44}{1.0 \sqrt{\frac{n^2 \times 205,000}{250}}} = 1.139 \]

So, \( \lambda_e = \sqrt{0.7 + 0.6 \times 1.139^2 + 5 \times 0.092^2} = 1.233 \)

\[ \phi = 0.5 \left[ 1 + a(\lambda_e - 0.2) + \lambda_e^2 \right] = 0.5 \left[ 1 + 0.49(1.233 - 0.2) + (1.233)^2 \right] = 1.513 \]  
(Cl. 7.1.2.1)

\[ X = \left( \phi + \sqrt{\phi^2 - \lambda_e^2} \right)^{-1} = \frac{1}{1.513 + \sqrt{(1.513)^2 - (1.233)^2}} = 0.418 \]

\[ f_{cd} = \frac{X \times f_y}{\gamma_{m0}} = \frac{0.418 \times 250(10)^6}{1.1} = 95.06 \text{ MPa} \]

The axial compression capacity under flexural torsional buckling is:

\[ P_{dft} = A_x \times f_{cd} = 40(10)^2 \text{ cm}^2 \times 95.06 \text{ MPa}(10)^{-3} = 380.2 \text{ MPa} \]

The minimum capacity governs, thus flexural torsional buckling controls. The utilization ratio is

\[ \frac{P}{P_d} = \frac{100}{380.2} = 0.263 \]

### STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\India\IS 800 2007 LSD - Angle - Flexural Torsional Buckling.STD` is typically installed with the program.

The following D8.A.4 Design Parameters (on page 1610) are used:

- The beam type is a cantilever, specified by CAN 1
- The member is connected by a single angle leg, so ANG 1
- The connection is considered “hinged” using FXTY 0
- Two or more bolts are assumed at the connection, thus NBL 1
- The beam is laterally unsupported, specified by LAT 0

V. IS 800 2007 LSD - Angle - Tension with Block Shear

Verify the design of a single angle subject to tension per the IS 800:2007 limit state method.

Reference

Related Links
• D8.A.2 Design Process (on page 1600)

Details
The member is a 3 m long cantilever subject to a 100 kN tensile force. The section used is a ISA 150x90x15. The steel has a yield strength of 250 MPa, an ultimate tensile strength of 420 MPa, and a modulus of elasticity of 205×(10)^3 MPa.

Validation
Constants
\[ \gamma_{m0} = 1.1 \]
\[ \gamma_{m1} = 1.25 \]

Check for yielding of gross section per Cl. 6.2:
\[ T_{dg} = A_g \times f_y / \gamma_{m0} = 770.5 \text{ kN} \] (Cl 6.2)

Check for rupture of critical section per Cl. 6.3:
\[ \alpha = 0.8 \]
The net section factor is given as 0.79.
\[
A_{\text{net}} = 0.79 \times 33.9 \text{ cm}^2 = 26.8 \text{ cm}^2
\]
\[
T_{\text{dn}} = \alpha \times A_{\text{net}} \times f_u / \gamma_m = 719.9 \text{ kN}
\]  
(6.3)

Check for block shear per Cl 6.4.1:

<table>
<thead>
<tr>
<th>Result Type</th>

<td></td>
</tr>
<tr>
<td>Ratio for tension</td>
<td>0.196</td>
<td>0.196</td>
<td>none</td>
<td></td>
</tr>
</tbody>
</table>

Then tension capacity in block shear, \( T_{db} = \min(T_{db,1}, T_{db,2}) = 509.6 \text{ kN} \)

Tension capacity, \( T_d = \min(T_{dg}, T_{dn}, T_{db}) = 509.6 \text{ kN} \)

The critical ratio for tension is \( 100 \text{ kN} / 509.6 \text{ kN} = 0.196 \)

Results

STAAD.Pro Input

The file C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\India\IS 800 2007 LSD - Angle - Tension with Block Shear.STD is typically installed with the program.

The following D8.A.4 Design Parameters (on page 1610) are used:

- The default value of ALPHA is used.
The net section factor is specified by NSF 0.79

The areas considered in the block rupture calculation are specified by:

- AVN 2040
- AVG 3525
- ATN 570
- ATG 675

The beam type is a cantilever, specified by CAN 1

The beam is laterally unsupported, specified by LAT 0

V. IS 800 2007 LSD - Channel - with LTB

Verify the design of a channel section with lateral-torsional buckling per the IS 800:2007 limit state method.

Reference

BIS. IS 808: Dimensions for Hot Rolled Steel Beam, Column, Channel, and Angle Sections. 1898. New Delhi. p.6

Details

The member is a 3 m long cantilever subject to a 10 kN compressive force and uniform bending moments of 1 kN/m along both major and minor axes. The section used is a ISMC 200 and is unbraced against lateral-torsional buckling. The steel has a yield strength of 250 MPa, an ultimate tensile strength of 420 MPa, a modulus of elasticity of $205 \times (10)^3$ MPa, and a Poisson's ratio, $\nu = 0.3$.

Section Properties From IS:808

- Cross-sectional area, $A_x = 28.5 \, \text{cm}^2$
- Overall depth of the section, $h = 200 \, \text{mm}$
- Width of flange, $b_f = 75 \, \text{mm}$
- Thickness of flange, $t_f = 11.4 \, \text{mm}$
- Thickness of web, $t_w = 6.2 \, \text{mm}$
- Distance from heel to centroid, $c_y = 2.20 \, \text{cm}$
- Moment of inertia about major axis, $I_z = 1,830 \, \text{cm}^4$
- Moment of inertia about minor axis, $I_y = 139 \, \text{cm}^4$*
- Radius of gyration about major axis, $r_z = 8.02 \, \text{cm}$
- Elastic section modulus about minor axis, $Z_{ey} = 26.4 \, \text{cm}^3$

* This value have been taken from the built-in section library STAAD.Pro of Indian sections.

Additional section properties:

- Plastic section modulus about major axis, $Z_{pz} = 213 \, \text{cm}^3$
- Plastic section modulus about minor axis, $Z_{py} = 51.1 \, \text{cm}^3$
- Torsional moment of inertia, $I_x = 9.83 \, \text{cm}^4$

Validation

Constants

$\gamma_{m0} = 1.1$
$\gamma_{m1} = 1.25$

Section Classification
\[ \epsilon = \sqrt{\frac{250}{f_y}} = 1 \]
\[ b = b / 2 = 37.5 \text{ mm} \]
\[ b / t_f = 6.58 < 9.4 \epsilon = 9.4 \]
\[ d_w / t_w = 25.03 < 42 \epsilon = 42 \]

Hence, from Table 2 of IS 800:2007, the flange is plastic but the web is non-slender (i.e., semi-compact).

Therefore, the overall classification of the section is “semi-compact”.

Hence, from Table 10 of IS 800:2007, the buckling class about both axes is “c”.

**Check Slenderness Ratio**

\[ k_y = k_z = 1 \]

The maximum allowable slenderness ratio is 180.

Slenderness ratio about the major axis, \( k_z L / r_z = 37.41 < 180 \)

Radius of gyration about minor axis, \( r_y = \sqrt{\frac{I_y}{A_x}} = \sqrt{\frac{139}{28.5}} = 2.21 \text{ cm} \)

Slenderness ratio about the minor axis, \( k_y L / r_y = 135.8 < 180 \)

So the slenderness is within the limit.

**Axial Tension Capacity**

Check for yielding of gross section:

\[ T_{dg} = A_x \times f_y / \gamma_{m0} = 647.7 \text{ kN} \]

Check for rupture of critical section:

\[ \alpha = 0.8 \]
\[ T_{dn} = \alpha \times A_{net} \times f_u / \gamma_{m1} = 766.1 \text{ kN} \]

Block shear areas are not specified and therefore not checked.

No tension in the member, so critical ratio is 0.

**Check Axial Compression**

Axial compression capacity of major axis:

The non-dimensional slenderness ratio, \( \lambda_z = \sqrt{\frac{f_y (k_z L / r_z)^2}{n^2 E}} = \sqrt{\frac{250(1.0 \times 3,000 / 80.2)^2}{n^2 \times 205,000}} = 0.416 \)

For buckling class “c”, the imperfection factor, \( \alpha = 0.49 \)

\[ \phi_z = 0.5 \left[ 1 + \alpha (\lambda_z - 0.2) + \lambda_z^2 \right] = 0.639 \]
\[ X_z = \frac{1}{\phi_z + \sqrt{\phi_z^2 \cdot \lambda_z^2}} = \frac{1}{0.639 + \sqrt{0.639^2 \cdot 0.416^2}} = 0.889 \]

So, as per Cl. 7.1.2.1 of IS 800:2007, \( f_{cdz} = \min \left( \frac{x_z f_y}{\gamma_{m0} \cdot \gamma_{m0}} \right) = 202.0 \text{ MPa} \)

Therefore, axial compression capacity in the major axis: \( P_{dz} = A_x f_{cdz} = 575.6 \text{ kN} \)

The critical ratio for axial compression in major axis: \( 10 / 575.6 = 0.017 \)
Axial compression capacity of minor axis:

The non-dimensional slenderness ratio, \( \lambda_y = \sqrt{\frac{f_y k_y L}{r_y^2 E}} = \sqrt{\frac{205(1.0 \times 3,000 / 22.2)^2}{n^2 \times 205,000}} = 1.502 \)

For buckling class “c”, the imperfection factor, \( \alpha = 0.49 \)

\[
\phi_y = 0.5 \left[ 1 + \alpha (\lambda_y - 0.2) + \lambda_y^2 \right] = 1.961
\]

\[
X_y = \frac{1}{\phi_y + \sqrt{\phi_y^2 - \lambda_y^2}} = 0.311
\]

So, as per Cl. 7.1.2.1 of IS 800:2007, \( f_{cdy} = \min \left( \frac{x_y f_y}{\gamma_m 0}, \frac{f_y}{\gamma_m 0} \right) = 70.75 \text{ MPa} \)

Therefore, axial compression capacity in the minor axis: \( P_{dy} = A_{x} f_{cdy} = 201.6 \text{ kN} \), which governs.

Check Shear Capacity

Major Axis

As per Cl. 8.4.1.1 of IS 800:2007, the shear area, \( A_{vz} = 2 \times b f_t f = 1,710 \text{ mm}^2 \)

So, as per Cl. 8.4.1, \( V_{pz} = \frac{A_{vz} f_{yw}}{\sqrt{3}} = 246.8 \text{ kN} \)

Hence, shear capacity along major axis: \( V_{dz} = \frac{V_{pz}}{\gamma_m 0} = 224.4 \text{ kN} \)

Critical shear ratio along major axis: \( 3 / 224.5 = 0.013 \)

Minor Axis

As per Cl. 8.4.1.1 of IS 800:2007, the shear area, \( A_{vy} = h \times t_w = 1,240 \text{ mm}^2 \)

So, as per Cl. 8.4.1, \( V_{py} = \frac{A_{vy} f_{yw}}{\sqrt{3}} = 179.0 \text{ kN} \)

Hence, shear capacity along major axis: \( V_{dy} = \frac{V_{py}}{\gamma_m 0} = 162.7 \text{ kN} \)

As per Cl. 8.4.2, \( d_w / t_w = 25.03 < 67 \epsilon \), so resistance to shear buckling need not be checked.

Shear force along both axes = 3 kN.

Critical shear ratio along minor axis: \( 3 / 162.7 = 0.018 \)

Check Bending Capacity

Since the section has been classified as “semi-compact”, \( \beta_b = Z_{ez} / Z_{pz} = 0.859 \).

Major Axis Bending

The elastic lateral-torsional buckling moment:

\[
M_{cr} = \sqrt{n^2 E I_{y} \left[ G I_{t} + n^2 E I_{w} \frac{L}{L^2} \right]}
\]

where
\( G = \) shear modulus, \( \frac{E}{2(1+\nu)} = 78,850 \text{ MPa} \)
\( d' = d \cdot t_f = 188.6 \text{ mm} \)
\( b' = b \cdot t_w/2 = 71.9 \text{ mm} \)
\( a = \frac{1}{2 + \frac{d}{t_w}} = \frac{18.86(0.62)}{3(7.19)(1.14)} = 0.404 \)
\( \lambda_{LT} = \min \left[ \frac{\beta_b Z_{pz} f_y}{M_{cr}} \right] \)
\( \chi_{LT} = \frac{1}{\phi_{LT} + \frac{1}{\phi_{LT}}} = 0.730 \)
\( f_{bd} = \frac{X_{LT} f_y}{\gamma_{m0}} = 165.9 \text{ MPa} \)

So, the bending strength with respect to the major axis is \( M_{dz} = \beta_b Z_{pz} f_{bd} = 30.35 \text{ kN·m} \)

Actual bending moment about the major axis is \( M_z = 4.5 \text{ kN·m} \).

The critical bending ratio in the major axis is \( 4.5 / 30.35 = 0.148 \).

Minor Axis Bending
Since the section has been classified as "semi-compact", \( \beta_b = \frac{Z_{ey}}{Z_{py}} = 0.517 \).

Actual shear force in both axes, \( V = 3 \text{ kN} < 0.6V_d = 89.75 \text{ kN} \). Hence, the section is subjected to low shear.
\( \frac{\beta_b Z_{py} f_y}{\gamma_{m0}} = 5.938 \text{ kN·m} \)
\( \frac{1.2Z_{ey} f_y}{\gamma_{m0}} = 8.907 \text{ kN·m} \)

So, the governing bending strength with respect to the minor axis is \( M_{dy} = 5.938 \text{ kN·m} \).

Actual bending moment about the minor axis is \( M_z = 4.5 \text{ kN·m} \).

The critical bending ratio in the minor axis is \( 4.5 / 5.938 = 0.758 \).

Check Combined Interaction of Axial Compression and Bending
Section strength calculation as per Cl. 9.3.1.3:

Compression strength in yielding: \( N_d = \frac{A_p f_y}{T_{m0}} = \frac{28.5(10)^{1.1(250)}}{1.1} = 647.7 \text{ kN} \)

\[
\frac{N}{N_d} + \frac{M_y}{M_{dy}} + \frac{M_z}{M_{dz}} = \frac{10}{647.7} + 0.758 + 0.148 = 0.921
\]

Overall member strength in bending and axial compression

\[
n_y = \frac{F_x}{P_{dy}} = 0.050
\]
\[
n_z = \frac{F_x}{P_{dz}} = 0.017
\]
\[
K_y = \min \left| 1 + (\lambda_y \cdot 0.2)n_y = 1 + (1.51 \cdot 0.2) \cdot 0.050 = 1.066
\right| \quad 1 + 0.8n_y = 1 + 0.8 \cdot 0.050 = 1.040
\]
\[
K_z = \min \left| 1 + (\lambda_z \cdot 0.2)n_z = 1 + (0.416 \cdot 0.2) \cdot 0.017 = 1.004
\right| \quad 1 + 0.8n_z = 1 + 0.8 \cdot 0.017 = 1.014
\]
\[
K_{LT} = \max \left| 1 - \frac{0.11LTn_y}{C_{my}M_y} = 1 - \frac{0.1 \times 0.905 \times 0.050}{0.9 \cdot 0.25} = 0.993
\right| \quad 1 - \frac{0.1n_y}{C_{my}M_y} = 1 - \frac{0.1 \times 0.050}{0.9 \cdot 0.25} = 0.992
\]

\[
\frac{P}{P_{dy}} + K_y \frac{C_{my}M_y}{M_{dy}} + K_{LT} \frac{M_z}{M_{dz}} = 0.906
\]
\[
\frac{P}{P_{dz}} + 0.6K_y \frac{C_{my}M_y}{M_{dy}} + K_z \frac{C_{mz}M_z}{M_{dz}} = 0.577
\]

**STAAD.Pro Input**

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\India\IS 800 2007 LSD - Channel - With LTB.STD` is typically installed with the program.

The following [D8.A.4 Design Parameters](on page 1610) are used:

- The default value of ALPHA is used.
• The value of KX 1.0 is directly specified.
• The default value of the maximum allowable slenderness ratio, MAIN, of 180 is used.
• The effective length for lateral-torsional buckling is specified as LX 3 (m).
• The beam type is a cantilever, specified by CAN 1
• The beam is laterally unsupported, specified by LAT 0
• The default values of CMX, CMY, and CMZ of 0.9 are used (CMZ 0.9 is directly specified).

V. IS 800 2007 LSD - I Section - High Shear

Verify the design of an I section beam subject to high shear per the IS 800:2007 limit state method.

Reference

Related Links
- D8.A.2 Design Process (on page 1600)

Details

The member is a 3 m long, simply-supported beam subject to the following forces:

- compression force of 100 kN at the "roller" end, and
- concentrated transverse loads of 350 kN at both of the one-third points acting along the minor axis of the section

The section used is a built-up I shape with 400 mm × 20 mm flanges, a web thickness of 8 mm, and an overall depth of 550 mm. The steel has a yield strength of 250 MPa, an ultimate tensile strength of 420 MPa, and a modulus of elasticity of 205×(10)^3 MPa. The member is laterally supported along its length.

Validation

Section Properties

Depth of web, \( d = 550 - 2 \times 20 = 510 \, mm \)

Cross-sectional area, \( A_x = 2(400 \times 20) + 510 \times 8 = 20,080 \, mm^2 = 200.8 \, cm^2 \)

Moment of inertia about major axis, \( I_z = \frac{2bf^3}{12} + 2bt \left( \frac{h}{2} \right) \left( \frac{t}{2} \right)^2 + \frac{td^3}{12} = 21,336 \, cm^4 \)

Moment of inertia about minor axis, \( I_y = \frac{2t^3 f}{12} + \frac{dt^3}{12} = 137 \, cm^4 \)

Radius of gyration about major axis, \( r_z = \frac{I_z}{A_x} = 247.7 \, mm \)

Radius of gyration about minor axis, \( r_y = \sqrt{I_y / A_x} = 103.1 \, mm \)

Elastic section modulus about major axis, \( Z_{ez} = \frac{I_z}{h / 2} = 4,409 \, cm^3 \)
Elastic section modulus about minor axis, \( Z_{ey} = \frac{I_z}{b_f/2} = 1,067 \text{ cm}^3 \)

Plastic section modulus about major axis, \( Z_{pz} = b_f t_f (h - t_f) + 0.25t_w(h - 2t_f)^2 = 4,760 \text{ cm}^3 \)

Plastic section modulus about minor axis, \( Z_{py} = \frac{b_f^2 t_f}{2} + 0.25t_w^2(h - 2t_f) = 1,608 \text{ cm}^3 \)

Constants
\[
\gamma_{m0} = 1.1 \\
\gamma_{m1} = 1.25
\]

Section Classification
\[
\varepsilon = \sqrt{\frac{250}{f_y}} = 1 \\
b = b_f/2 = 200 \text{ mm} \\
b / t_f = 10 < 9.4\varepsilon = 9.4 \text{ and } b / t_f = 10 > 10.5\varepsilon = 10.5
\]
Since the section is symmetric about both axes, the neutral axis is at mid-depth.
\[
d_w / t_w = 63.75 < 84\varepsilon = 84
\]
Hence, from Table 2 of IS 800:2007, the flange is compact and the web is plastic.

Therefore, the overall classification of the section is "compact".
\[
h / b_f = 1.375 > 1.2 \text{ and } t_f = 20 \text{ mm} < 40 \text{ mm}
\]
Hence, from Table 10 of IS 800:2007, the buckling class about the major axis is “a” and the same about the minor axis is “b”.

Check Slenderness Ratio
\[
k_y = k_z = 1
\]
The maximum allowable slenderness ratio is 180.
Slenderness ratio about the major axis, \( k_zL / r_z = 12.21 < 180 \)
Slenderness ratio about the minor axis, \( k_yL / r_y = 29.10 < 180 \)
So the slenderness is within the limit.

Axial Tension Capacity
Check for yielding of gross section:
\[
T_{dg} = A_g \times f_y / \gamma_{m0} = 4,564 \text{ kN}
\]
Check for rupture of critical section:
\[
\alpha = 0.8 \\
T_{dn} = \alpha \times A_{net} \times f_u / \gamma_{m1} = 5,398 \text{ kN}
\]
Block shear areas are not specified and therefore not checked.
No tension in the member, so critical ratio is 0.

Check Axial Compression
Axial compression capacity of major axis:
The non-dimensional slenderness ratio, $\lambda_z = \sqrt{\frac{f_y (k_z L / r_z)^2}{n^2 E}} = 0.136$

For buckling class “a”, the imperfection factor, $\alpha = 0.21$

$$\phi_z = 0.5 \left[ 1 + \alpha (\lambda_z \cdot 0.2) + \lambda_z^2 \right] = 0.502$$

$$\chi_z = \frac{1}{\phi_z + \sqrt{\phi_z^2 - \lambda_z^2}} = 1.014$$

So, as per Cl. 7.1.2.1 of IS 800:2007, $f_{cdz} = \min \left( \frac{x_z f_y}{\gamma_{m0}} \cdot \frac{f_y}{\gamma_{m0}} \right) = 227.3 \text{ MPa}$

Therefore, axial compression capacity in the major axis: $P_{dz} = A_x f_{cdz} = 4,564 \text{ kN}$

Axial compression capacity of minor axis:

The non-dimensional slenderness ratio, $\lambda_y = \sqrt{\frac{f_y (k_y L / r_y)^2}{n^2 E}} = 0.324$

For buckling class “b”, the imperfection factor, $\alpha = 0.34$

$$\phi_y = 0.5 \left[ 1 + \alpha (\lambda_y \cdot 0.2) + \lambda_y^2 \right] = 0.573$$

$$\chi_y = \frac{1}{\phi_y + \sqrt{\phi_y^2 - \lambda_y^2}} = 0.955$$

So, as per Cl. 7.1.2.1 of IS 800:2007, $f_{cdy} = \min \left( \frac{x_y f_y}{\gamma_{m0}} \cdot \frac{f_y}{\gamma_{m0}} \right) = 217.1 \text{ MPa}$

Therefore, axial compression capacity in the minor axis: $P_{dy} = A_y f_{cdy} = 4,360 \text{ kN}$, which governs.

The critical ratio for axial compression = $100 / 4,360 = 0.023$

Check Shear Capacity

Major Axis

As per Cl. 8.4.1.1 of IS 800:2007, the shear area, $A_{uz} = 2 \times b f_t = 16,000 \text{ mm}^2$

So, as per Cl. 8.4.1, $V_{pz} = \frac{A_{uz} f_{yw}}{\sqrt{3}} = 2,309 \text{ kN}$

Hence, shear capacity along major axis: $V_{dz} = \frac{V_{pz}}{\gamma_{m0}} = 2,099 \text{ kN}$

Minor Axis

As per Cl. 8.4.1.1 of IS 800:2007, the shear area, $A_{vy} = h \times t_w = 4,400 \text{ mm}^2$

So, as per Cl. 8.4.1, $V_{py} = \frac{A_{vy} f_{yw}}{\sqrt{3}} = 635.1 \text{ kN}$

Hence, shear capacity along major axis: $V_{dy} = \frac{V_{py}}{\gamma_{m0}} = 577.4 \text{ kN}$

As per Cl. 8.4.2, $d / t_w = 63.75 < 67\varepsilon$, so resistance to shear buckling need not be checked.

No shear force along major axis (i.e., ratio = 0).
Critical shear ratio along minor axis: \( \frac{350}{577.4} = 0.606 \)

**Check Bending Capacity**

Since the section has been classified as "compact", \( \beta_b = 1 \).

**Major Axis Bending**

The actual shear force along the major axis, \( V = 350 \, kN > 0.6V_d = 346.4 \, kN \). Thus, the section is subjected to high shear.

\[
M_{dz} = \min \left( \beta_b Z_{pz} \frac{f_y}{\gamma_{m0}}, \frac{1.2Z_{ez} f_y}{\gamma_{m0}} \right) = 1,082 \, kN \cdot m \tag{Cl 8.2.1.1}
\]

Per Cl 9.2.2(a) for "compact" sections:

\[
\beta = \left( \frac{2V}{V_d} - 1 \right)^2 = 0.045
\]

The plastic section modulus excluding shear area, \( Z_{fdz} = Z_{pz} \frac{t_w h^2}{4} = 4,155 \, cm^3 \)

Plastic design strength of cross-section area excluding shear area, \( M_{fdz} = \frac{Z_{fdz} f_y}{\gamma_{m0}} = 944.4 \, kN \cdot m \)

\[
M_{dvz} = M_{dz} - \beta(M_{dz} \cdot M_{fdz}) = 1,082 - 0.045 \times (1,082 - 944.4) = 1,076 \, kN \cdot m
\]

So, the governing bending strength with respect to the major axis is \( M_{dz} = M_{dvz} = 1,076 \, kN \cdot m \).

**Minor Axis Bending**

There is no shear along the minor axis.

\[
\frac{\beta_b Z_{py} f_y}{\gamma_{m0}} = 365.5 \, kN \cdot m
\]

\[
\frac{1.2Z_{ey} f_y}{\gamma_{m0}} = 290.9 \, kN \cdot m
\]

So, the governing bending strength with respect to the minor axis is \( M_{dy} = 290.9 \, kN \cdot m \)

No bending moment about the minor axis in beam, so critical ratio is 0.

**Check Combined Interaction of Axial Compression and Bending**

Section strength calculation as per Cl. 9.3.1:

\[
n = \frac{N}{N_d} = 0.022 < 0.2
\]

Hence, from Table 17:

\[
\alpha_1 = \max(5n, 1) = 1
\]

\[
\alpha_2 = 2
\]

\[
M_{ndy} = M_{dy} = 290.9 \, kN \cdot m
\]

\[
1.11 M_{dz} (1 - n) = 1,168 \, kN \cdot m > M_{dz}
\]

\[
M_{ndz} = M_{dz} = 1,076 \, kN \cdot m
\]
\[
\left( \frac{M_y}{M_{ndy}} \right)^{a_1} + \left( \frac{M_z}{M_{ndz}} \right)^{a_2} = \left( \frac{0}{290.9} \right)^1 + \left( \frac{350}{1076} \right)^2 = 0.106
\]

Overall member strength in bending and axial compression

\[n_y = \frac{F_x}{P_{dy}} = 0.023\]
\[n_z = \frac{F_x}{P_{dz}} = 0.022\]
\[K_y = \min \left\{ 1 + (\lambda_y \cdot 0.2)n_y = 1 + (0.324 \cdot 0.2)0.023 = 1.003 \right\}
\[1 + 0.8n_y = 1 + 0.8 \cdot 0.023 = 1.018\]
\[K_z = \min \left\{ 1 + (\lambda_z \cdot 0.2)n_z = 1 + (0.136 \cdot 0.2)0.022 = 0.999 \right\}
\[1 + 0.8n_z = 1 + 0.8 \cdot 0.022 = 1.018\]

\[
P_{dz} + 0.6K_y \frac{C_{my}M_y}{M_{dy}} + K_z \frac{C_{mz}M_z}{M_{dz}} = 0.314
\]

**STAAD.Pro Input**

The file C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\India\IS 800 2007 LSD - I Section - High Shear.STD is typically installed with the program.

The following D8.A.4 Design Parameters (on page 1610) are used:

- The default value of ALPH is used.
- The default values of KY and KZ are used.
- The default value of the maximum allowable slenderness ratio, MAIN, of 180 is used.
- The beam type is simply supported, specified by CAN 2
- The beam is laterally supported, specified by LAT 1
- The default values of CMX, CMY, and CMZ of 0.9 are used.

**V. IS 800 2007 LSD - I Section - with LTB**

Verify the design of an I section with lateral-torsional buckling per the IS 800:2007 limit state method.

**Reference**

**Related Links**

- D8.A.2 Design Process (on page 1600)
Details
The member is a 3 m long cantilever subject to a 10 kN compressive force and uniform bending moments of 1 kN/m along both major and minor axes. The section used is an ISMB200 and is unbraced against lateral-torsional buckling. The steel has a yield strength of 250 MPa, an ultimate tensile strength of 420 MPa, a modulus of elasticity of 205×(10)^3 MPa, and a Poisson’s ratio, ν = 0.3.

Validation
Constants
\[ \gamma_m^0 = 1.1 \]
\[ \gamma_m^1 = 1.25 \]
Section Classification
\[ \varepsilon = \frac{250}{f_y} = 1 \]
\[ b = b_f/2 = 50 \text{ mm} \]
\[ b / t_f = 5 < 9.4 \varepsilon = 9.4 \]
Since the section is symmetric about both axes, the neutral axis is at mid-depth.
\[ d_w / t_w = 27.72 < 84 \varepsilon = 84 \]
Hence, from Table 2 of IS 800:2007, both the flange and web are plastic.
Therefore, the overall classification of the section is “plastic”.
\[ h / b_f = 2 > 1.2 \text{ and } t_f = 10 \text{ mm} < 40 \text{ mm} \]
Hence, from Table 10 of IS 800:2007, the buckling class about the major axis is “a” and the same about the minor axis is “b”.
Check Slenderness Ratio
\[ k_y = k_z = 1 \]
The maximum allowable slenderness ratio is 180.
Slenderness ratio about the major axis, \[ k_z L / r_z = 36.20 < 180 \]
Slenderness ratio about the minor axis, \[ k_y L / r_y = 142.2 < 180 \]
So the slenderness is within the limit.
Axial Tension Capacity
Check for yielding of gross section:
\[ T_{dg} = A_g \times f_y / \gamma_m^0 = 700 \text{ kN} \]
Check for rupture of critical section:
\[ \alpha = 0.8 \]
\[ T_{dn} = \alpha \times A_{net} \times f_u / \gamma_m^1 = 827.9 \text{ kN} \]
Block shear areas are not specified and therefore not checked.
No tension in the member, so critical ratio is 0.
Axial compression capacity of major axis:

The non-dimensional slenderness ratio, \( \lambda_z = \frac{f_y \left( k_z L / r_z \right)^2}{n^2 E} = 0.402 \)

For buckling class "a", the imperfection factor, \( \alpha = 0.21 \)

\[
\phi_z = 0.5 \left[ 1 + \alpha (\lambda_z - 0.2) + \lambda_z^2 \right] = 0.602
\]

\[
X_z = \frac{1}{\phi_z + \sqrt{\phi_z^2 - \lambda_z^2}} = 0.952
\]

So, as per Cl. 7.1.2.1 of IS 800:2007, \( f_{cdz} = \min \left( \frac{x_z f_y}{\gamma_m}, \frac{f_y}{\gamma_m} \right) = 216.4 \text{ MPa} \)

Therefore, axial compression capacity in the major axis: \( P_{dz} = A f_{cdz} = 666.5 \text{ kN} \)

The critical ratio for axial compression in major axis = \( 10 / 666.5 = 0.015 \)

Axial compression capacity of minor axis:

The non-dimensional slenderness ratio, \( \lambda_y = \frac{f_y \left( k_y L / r_y \right)^2}{n^2 E} = 1.581 \)

For buckling class "b", the imperfection factor, \( \alpha = 0.34 \)

\[
\phi_y = 0.5 \left[ 1 + \alpha (\lambda_y - 0.2) + \lambda_y^2 \right] = 1.985
\]

\[
X_y = \frac{1}{\phi_y + \sqrt{\phi_y^2 - \lambda_y^2}} = 0.314
\]

So, as per Cl. 7.1.2.1 of IS 800:2007, \( f_{cdy} = \min \left( \frac{x_y f_y}{\gamma_m}, \frac{f_y}{\gamma_m} \right) = 71.37 \text{ MPa} \)

Therefore, axial compression capacity in the minor axis: \( P_{dy} = A f_{cdy} = 219.8 \text{ kN}, \) which governs.

The critical ratio for axial compression in minor axis = \( 10 / 219.8 = 0.045 \)

Check Shear Capacity

Major Axis

As per Cl. 8.4.1.1 of IS 800:2007, the shear area, \( A_{vz} = 2 \times b f_y = 2,000 \text{ mm}^2 \)

So, as per Cl. 8.4.1, \( V_{pz} = \frac{A_{vz} f_y}{\sqrt{3}} = 288.7 \text{ kN} \)

Hence, shear capacity along major axis: \( V_{dz} = \frac{V_{pz}}{\gamma_m} = 262.4 \text{ kN} \)

Minor Axis

As per Cl. 8.4.1.1 of IS 800:2007, the shear area, \( A_{vy} = h \times t_w = 1,140 \text{ mm}^2 \)

So, as per Cl. 8.4.1, \( V_{py} = \frac{A_{vy} f_y}{\sqrt{3}} = 164.5 \text{ kN} \)

Hence, shear capacity along major axis: \( V_{dy} = \frac{V_{py}}{\gamma_m} = 149.6 \text{ kN} \)
As per Cl. 8.4.2, \( d_w / t_w = 27.72 < 67\varepsilon\), so resistance to shear buckling need not be checked.

Shear force along both axes = 3 kN.

Critical shear ratio along major axis: \( 3 / 149.6 = 0.020\)

Critical shear ratio along minor axis: \( 3 / 262.4 = 0.011\)

**Check Bending Capacity**

Since the section has been classified as "plastic", \( \beta_b = 1\).

**Major Axis Bending**

The elastic lateral-torsional buckling moment:

\[
M_{cr} = \frac{n^2EI_y}{L} \left( GJ_t + \frac{n^2EI_w}{L^2} \right)
\]

where

- \( G \) = shear modulus, \( = \frac{E}{2(1+v)} = 78,850 \) MPa
- \( I_t \) = torsional constant, \( I_x = 10.6 \) cm\(^4\)
- \( d' = h - t_f = 190 \) mm
- \( I_w \) = warping constant, as taken from the CISC document “Torsional Section Properties of Steel Shapes” (see reference), \( = \frac{(d')^2b^3_t f}{24} = 15,042 \) cm\(^6\)

\( M_{cr} = 60.13 \) kN·m

\[
\frac{\beta_bZ_{pz}f_y}{M_{cr}} = 0.999
\]

\[
\lambda_{LT} = \min \left[ \frac{1.2Z_{cy}f_y}{M_{cr}} = 1.027 \right]
\]

\[
\phi_{LT} = 0.5\left[ 1 + 0.21(\lambda_{LT} \cdot 0.2) + \lambda_{LT}^2 \right] = 1.803
\]

\[
\chi_{LT} = \frac{1}{\phi_{LT} + \sqrt{\lambda_{LT}^2 \cdot \lambda_{LT}^2}} = 0.666
\]

\[
f_{bd} = \frac{x_{LT} f_y}{\gamma_{m0}} = 151.4 \) MPa

So, the bending strength with respect to the major axis is \( M_{dz} = \beta_bZ_{pz}f_{bd} = 36.35 \) kN·m

Actual bending moment about the major axis is \( M_z = 4.5 \) kN·m.

The critical bending ratio in the major axis is \( 4.5 / 36.35 = 0.124\)

**Minor Axis Bending**

Actual shear force in both axes, \( V = 3 \) kN < 0.6\( V_d = 89.75 \) kN. Hence, the section is subjected to low shear.

\[
\frac{\beta_bZ_{py}f_y}{\gamma_{m0}} = 10.46 \) kN·m
\]

\[
\frac{1.2Z_{cy}f_y}{\gamma_{m0}} = 9.341 \) kN·m
So, the governing bending strength with respect to the minor axis is $M_{dy} = 9.341 \text{ kN} \cdot \text{m}$

Actual bending moment about the minor axis is $M_z = 4.5 \text{ kN} \cdot \text{m}$.

The critical bending ratio in the minor axis is $4.5 / 9.341 = 0.482$

Check Combined Interaction of Axial Compression and Bending

Section strength calculation as per Cl. 9.3.1:

$$n = \frac{N}{N_d} = 0.014 < 0.2$$

Hence, from Table 17:

$$\alpha_1 = \max(5n, 1) = 1$$

$$\alpha_2 = 2$$

$$M_{ndy} = M_{dy} = 9.341 \text{ kN} \cdot \text{m} \quad \text{(Cl. 9.3.1.2(c))}$$

$$1.11 M_{dz} (1 \cdot n) = 39.78 \text{ kN} \cdot \text{m} > M_{dz}$$

$$M_{ndz} = M_{dz} = 36.35 \text{ kN} \cdot \text{m}$$

$$\left( \frac{M_y}{M_{ndy}} \right)^{a_1} + \left( \frac{M_z}{M_{ndz}} \right)^{a_2} = \left( \frac{4.5}{9.341} \right)^1 + \left( \frac{4.5}{36.35} \right)^2 = 0.497$$

Overall member strength in bending and axial compression

$$n_y = \frac{F_x}{P_{dy}} = 0.045$$

$$n_z = \frac{F_x}{P_{dz}} = 0.015$$

$$K_y = \min \left| \begin{array}{c}
1 + (\lambda_y \cdot 0.2)n_y = 1 + (1.581 \cdot 0.2) \cdot 0.045 = 1.063 \\
1 + 0.8n_y = 1 + 0.8 \cdot 0.045 = 1.036
\end{array} \right|$$

$$K_z = \min \left| \begin{array}{c}
1 + (\lambda_z \cdot 0.2)n_z = 1 + (0.402 \cdot 0.2) \cdot 0.015 = 1.003 \\
1 + 0.8n_z = 1 + 0.8 \cdot 0.015 = 1.012
\end{array} \right|$$

$$K_{LT} = \max \left| \begin{array}{c}
1 + \frac{0.11}{\frac{c_{mLT} n_y}{0.25}} = 1 + \frac{0.1 \times 0.999 \times 0.045}{0.9 \cdot 0.25} = 0.993 \\
1 + \frac{0.1 n_y}{\frac{c_{mLT} 0.25}{0.25}} = 1 + \frac{0.1 \times 0.045}{0.9 \cdot 0.25} = 0.993
\end{array} \right|$$

$$\frac{P}{P_{dy}} + K_y \frac{C_{my} M_y}{M_{dy}} + K_{LT} \frac{M_z}{M_{dz}} = 0.618$$

$$\frac{P}{P_{dz}} + 0.6 K_y \frac{C_{my} M_y}{M_{dy}} + K_z \frac{C_{mz} M_z}{M_{dz}} = 0.397$$

**STAAD.Pro Input**

The file C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\India\IS 800 2007 LSD - I Section - with LTB.STD is typically installed with the program.

The following **D8.A.4 Design Parameters** (on page 1610) are used:

- The default value of ALPHA is used.
- The default values of KY and KZ are used (KX 1.0 is directly specified).
- The default value of the maximum allowable slenderness ratio, MAIN, of 180 is used.
- The effective length for lateral-torsional buckling is specified as LX 3 (m).
- The beam type is a cantilever, specified by CAN 1
- The beam is laterally unsupported, specified by LAT 0
- The default values of CMX, CMY, and CMZ of 0.9 are used (CMZ 0.9 is directly specified).

Verification Examples

V. IS 800 2007 LSD - I Section - without LTB

Verify the design of an I section subject to axial force and biaxial bending per the IS 800:2007 limit state method.

Reference

Related Links

• *D8.A.2 Design Process* (on page 1600)

Details

The member is a 3 m long cantilever subject to a 10 kN compressive force and uniform bending moments of 1 kN/m along both major and minor axes. The section used is a ISMB200 and is braced to prevent lateral-torsional buckling. The steel has a yield strength of 250 MPa, an ultimate tensile strength of 420 MPa, and a modulus of elasticity of 205×(10)³ MPa.

Validation

Constants

\[ \gamma_{m0} = 1.1 \]
\[ \gamma_{m1} = 1.25 \]

Section Classification

\[ \epsilon = \sqrt{250/\sigma_y} = 1 \]
\[ b = b_t/2 = 50 \text{ mm} \]
\[ b/t_f = 5 < 9.4\epsilon = 9.4 \]
Since the section is symmetric about both axes, the neutral axis is at mid-depth.

\[ \frac{d_w}{t_w} = 27.72 < 84 \epsilon = 84 \]

Hence, from Table 2 of IS 800:2007, both the flange and web are plastic.

Therefore, the overall classification of the section is "plastic".

\[ \frac{h}{b_f} = 2 > 1.2 \text{ and } t_f = 10 \text{ mm} < 40 \text{ mm} \]

Hence, from Table 10 of IS 800:2007, the buckling class about the major axis is “a” and the same about the minor axis is “b”.

**Check Slenderness Ratio**

\[ k_y = k_z = 1 \]

The maximum allowable slenderness ratio is 180.

Slenderness ratio about the major axis, \( k_z L / r_z = 36.20 < 180 \)

Slenderness ratio about the minor axis, \( k_y L / r_y = 142.2 < 180 \)

So the slenderness is within the limit.

**Axial Tension Capacity**

Check for yielding of gross section:

\[ T_{dg} = A_g \times f_y / \gamma_m = 700 \text{ kN} \]

Check for rupture of critical section:

\[ \alpha = 0.8 \]

\[ T_{dn} = \alpha \times A_{net} \times f_u / \gamma_m = 827.9 \text{ kN} \]

Block shear areas are not specified and therefore not checked.

No tension in the member, so critical ratio is 0.

**Check Axial Compression**

Axial compression capacity of major axis:

The non-dimensional slenderness ratio, \( \lambda_z = \sqrt{\frac{f_y (k_z L / r_z)^2}{n^2 E}} = 0.402 \)

For buckling class “a”, the imperfection factor, \( \alpha = 0.21 \)

\[ \phi_z = 0.5 \left[ 1 + \alpha (\lambda_z - 0.2) + \lambda_z^2 \right] = 0.602 \]

\[ \chi_z = \frac{1}{\phi_z + \sqrt{\phi_z^2 - \lambda_z^2}} = 0.952 \]

So, as per Cl. 7.1.2.1 of IS 800:2007, \( f_{cdz} = \min \left( \frac{x_z f_y}{\gamma_{m0}}, \frac{f_y}{\gamma_{m0}} \right) = 216.4 \text{ MPa} \)

Therefore, axial compression capacity in the major axis: \( P_{dz} = A_{sfz} f_{cdz} = 666.5 \text{ kN} \)

The critical ratio for axial compression in major axis = \( 10 / 666.5 = 0.015 \)

Axial compression capacity of minor axis:
The non-dimensional slenderness ratio, \( \lambda_y = \sqrt{\frac{f_y k_y L}{n^2 E}} = 1.581 \)

For buckling class “b”, the imperfection factor, \( \alpha = 0.34 \)
\[
\phi_y = 0.5\left[1 + \alpha(\lambda_y - 0.2) + \lambda_y^2\right] = 1.985
\]
\[
\chi_y = 1 - \frac{\phi_y}{\sqrt{\phi_y^2 + \lambda_y^2}} = 0.314
\]

So, as per Cl. 7.1.2.1 of IS 800:2007, \( f_{cdy} = \min(\chi_y f_y \gamma_{m0}, f_y \gamma_{m0}) = 71.37 \text{ MPa} \)

Therefore, axial compression capacity in the minor axis: \( P_{dy} = A_{x} f_{cdy} = 219.8 \text{ kN} \), which governs.

The critical ratio for axial compression in minor axis = \( 10 / 219.8 = 0.045 \)

Check Shear Capacity

Major Axis
As per Cl. 8.4.1.1 of IS 800:2007, the shear area, \( A_{vz} = \frac{2 \times b_f t_f}{2,000 \text{ mm}^2} \)

So, as per Cl. 8.4.1, \( V_{pz} = \frac{A_{vz} f_{yw}}{\sqrt{3}} = 288.7 \text{ kN} \)

Hence, shear capacity along major axis: \( V_{dz} = \frac{V_{pz}}{\gamma_{m0}} = 262.4 \text{ kN} \)

Minor Axis
As per Cl. 8.4.1.1 of IS 800:2007, the shear area, \( A_{vy} = h \times t_w = 1,140 \text{ mm}^2 \)

So, as per Cl. 8.4.1, \( V_{py} = \frac{A_{vy} f_{yw}}{\sqrt{3}} = 164.5 \text{ kN} \)

Hence, shear capacity along major axis: \( V_{dy} = \frac{V_{py}}{\gamma_{m0}} = 149.6 \text{ kN} \)

As per Cl. 8.4.2, \( d_w / t_w = 27.72 < 67\varepsilon \), so resistance to shear buckling need not be checked.

Shear force along both axes = 3 kN.

Critical shear ratio along major axis: \( 3 / 149.6 = 0.020 \)

Critical shear ratio along minor axis: \( 3 / 262.4 = 0.011 \)

Check Bending Capacity

Since the section has been classified as “plastic”, \( \beta_b = 1. \)

Actual shear force in both axes, \( V = 3 \text{ kN} < 0.6V_d = 89.75 \text{ kN} \). Hence, the section is subjected to low shear.

Major Axis Bending
\[
\frac{\beta_b^2 Z_{py} f_y}{\gamma_{m0}} = 54.55 \text{ kN m}
\]
\[
\frac{1.2Z_{cy} f_y}{\gamma_{m0}} = 72.10 \text{ kN m}
\]
So, the governing bending strength with respect to the minor axis is \( M_{dy} = 54.55 \text{ kN m} \)

Actual bending moment about the major axis is \( M_z = 4.5 \text{ kN m} \).

The critical bending ratio in the major axis is \( \frac{4.5}{54.55} = 0.083 \)

Minor Axis Bending

\[
\frac{\rho b Z_p y_f}{\gamma_{m0}} = 10.46 \text{ kN m}
\]

\[
\frac{1.2 Z_e y_f}{\gamma_{m0}} = 9.341 \text{ kN m}
\]

So, the governing bending strength with respect to the minor axis is \( M_{dy} = 9.341 \text{ kN m} \)

Actual bending moment about the minor axis is \( M_z = 4.5 \text{ kN m} \).

The critical bending ratio in the minor axis is \( \frac{4.5}{9.341} = 0.482 \)

Check Combined Interaction of Axial Compression and Bending

Section strength calculation as per Cl. 9.3.1:

\[
n = \frac{N}{N_d} = 0.014 < 0.2
\]

Hence, from Table 17:

\[
a_1 = \text{max}(5n, 1) = 1
\]

\[
a_2 = 2
\]

\[
M_{ndy} = M_{dy} = 9.341 \text{ kN m}
\]

\[
1.11 \cdot M_{dz} \left(1 - n\right) = 59.70 \text{ kN m} > M_{dz}
\]

\[
M_{ndz} = M_{dz} = 54.55 \text{ kN m}
\]

\[
\left(\frac{M_y}{M_{ndy}}\right)^{a_1} + \left(\frac{M_z}{M_{ndz}}\right)^{a_2} = \left(\frac{4.5}{9.341}\right)^1 + \left(\frac{4.5}{54.55}\right)^2 = 0.489
\]

Overall member strength in bending and axial compression

\[
n_y = \frac{F_x}{P_{dy}} = 0.045
\]

\[
n_z = \frac{F_x}{P_{dz}} = 0.015
\]

\[
K_y = \min \left[ 1 + (\lambda_y - 0.2)n_y = 1 + (1.581 - 0.2) \cdot 0.045 = 1.063 \right.
\]

\[
1 + 0.8n_y = 1 + 0.8 \cdot 0.045 = 1.036
\]

\[
K_z = \min \left[ 1 + (\lambda_z - 0.2)n_z = 1 + (0.402 - 0.2) \cdot 0.015 = 1.003 \right.
\]

\[
1 + 0.8n_z = 1 + 0.8 \cdot 0.015 = 1.012
\]

\[
\frac{P}{T_{dz}} + 0.6K_y \frac{C_{my} M_y}{M_{dy}} + K_z \frac{C_{mz} M_z}{M_{dz}} = 0.359
\]

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\India\IS 800 2007 LSD - I Section - without LTB.STD` is typically installed with the program.

The following [D8.A.4 Design Parameters](on page 1610) are used:

- The default value of ALPHA is used.
- The default values of KY and KZ are used (KX 1.0 is directly specified).
- The default value of the maximum allowable slenderness ratio, MAIN, of 180 is used.
- The effective length for lateral-torsional buckling is specified as LX 3 (m).
- The beam type is a cantilever, specified by CAN 1
- The beam is laterally supported, specified by LAT 1
- The default values of CMX, CMY, and CMZ of 0.9 are used (CMZ 0.9 is directly specified).

**V. IS 800 2007 LSD - I Section with Cover Plate**

Verify the design of an I section with cover plates subject to axial force and biaxial bending per the IS 800:2007 limit state method.

**Reference**

**Related Links**

- [D8.A.2 Design Process](on page 1600)

**Details**

The structure consists of a 5 m long column with fixed based and a 5 m cantilever beam at the top. The resulting loads on the column to be designed are:

- a 55.98 kN·m moment about the major axis
- a 10 kN·m moment about the minor axis
- a 23.984 kN compressive force
- a 2 kN shear force along the major axis
- a 1.2 kN shear force along the minor axis

The section used is an ISMB500 with a 250 mm × 10 mm top cover plate and a 200 mm × 10 mm bottom cover plate. The section is braced to prevent lateral-torsional buckling. The steel has a yield strength of 250 MPa, an ultimate tensile strength of 420 MPa, and a modulus of elasticity of 205×(10)³ MPa.
Validation

Section Properties

Overall depth of the whole section, \( h = D + t_{pl1} + t_{pl2} = 500 + 10 + 10 = 520 \text{ mm} \)

Depth of web of IS MB500, \( d_w = D - 2\times t_f = 500 - 2 \times 17.2 = 465.6 \text{ mm} \)

Cross-section area of top cover plate, \( A_{top} = 25 \text{ cm} \times 1 \text{ cm} = 25 \text{ cm}^2 \)

Cross-section area of bottom cover plate, \( A_{bottom} = 20 \text{ cm} \times 1 \text{ cm} = 20 \text{ cm}^2 \)

Cross-section area, \( A_x = 111 \text{ cm}^2 + 25 \text{ cm}^2 + 20 \text{ cm}^2 = 156 \text{ cm}^2 \)

Distance of CG from top of overall section: \( y = \frac{A_{top} \left( \frac{t_{pl1}}{2} + D \right) + A_x \left( \frac{t_{pl1}}{2} + D + \frac{t_{pl2}}{2} \right)}{A_x} = 251.8 \text{ mm} \)

Overall moment of inertia about the major axis:

\[
I_z = I_z' + A_x \left( \frac{D}{2} + t_{pl1} \cdot y \right)^2 + \frac{b_{pl1} t_{pl1}^3}{12} + A_{top} \left( \frac{t_{pl1}}{2} \cdot y \right)^2 + \frac{b_{pl2} t_{pl2}^3}{12} + A_{bottom} \left( t_{pl1} + D + \frac{t_{pl2}}{2} \cdot y \right)^2
\]

\[
I_z = 45,200 \times (10)^4 + 111 \times (10)^2 \left( \frac{500}{2} + 10 \cdot 251.8 \right)^2 + \frac{250 \times 10^3}{12} + 2,500 \left( \frac{10}{2} \cdot 251.8 \right)^2 + 200 \times 10^3 \left( 10 + 500 + \frac{5}{2} \cdot 251.8 \right)^2
\]

\[
= 743.6(10)^6 \text{ mm}^4 = 74,360 \text{ cm}^4
\]

Overall moment of inertia about the minor axis (section is symmetric about this axis):
\[ I_y = I'_{y} + \frac{t_{p1}^3 b_{p1}}{12} + \frac{t_{p2}^3 b_{p2}}{12} = 1,370 \times (10)^4 + \frac{10 \times 250^3}{12} + \frac{10 \times 200^3}{12} = 33.39(10)^6 \text{ mm}^4 = 3,339 \text{ cm}^4 \]

Radius of gyration about the major axis, \( r_z = \sqrt{\frac{I_z}{A_x}} = \sqrt{74,360 / 156} = 21.8 \text{ cm} \)

Radius of gyration about the minor axis, \( r_y = \sqrt{\frac{I_y}{A_x}} = \sqrt{3,339 / 156} = 4.63 \text{ cm} \)

Elastic section modulus about the major axis, \( Z_{ez} = \frac{I_z}{h - y} = \frac{74,360}{52 - 25.18} = 2,773 \text{ cm}^3 \)

Elastic section modulus about the minor axis, \( Z_{ey} = \frac{I_y}{b_{p1}/2} = \frac{3,339}{25/2} = 267.1 \text{ cm}^3 \)

Distance to equal area axis from top, \( c_p = \frac{(D + 2t_{p1} + t_f) t_{w} + b_{f} t_{p2} b_{p2} - b_{f} t_{p1} t_{p1}}{2t_{w}} = 226.9 \text{ mm} \)

Plastic section modulus about the major axis,
\[
Z_{pz} = b_{f} t_{p1} \left( c_p \cdot \frac{t_{p1}}{2} \right) + b_{f} t_{f} \left( c_p \cdot t_{p1} \cdot \frac{t_f}{2} \right) + t_w \left( \frac{c_p \cdot t_{p1} \cdot t_f}{2} \right)^2 + t_w \left( \frac{D + t_{p1} \cdot c_p \cdot t_f}{2} \right)^2 + b_{f} t_{f} \left( D + t_{p1} \cdot c_p \cdot t_f \right) + b_{f} t_{p2} t_{p2} \left( D + t_p + \frac{t_{p2}}{2} \cdot c_p \right) = 3,190 \text{ cm}^3
\]

Plastic section modulus about the minor axis, \( Z_{py} = \frac{2t_{f} + \frac{b_{f} t_{f}}{4} + \frac{d_{w} t_{w}^{2}}{4} + \frac{t_{p1} b_{p1}^{2}}{4} + \frac{t_{p2} b_{p2}^{2}}{4}}{4} = 547 \text{ cm}^3 \)

Constants
\[
\gamma_{m0} = 1.1 \\
\gamma_{m1} = 1.25
\]

Section Classification
\[
\varepsilon = \sqrt{250/f_y} = 1
\]

Section classification of different portions of the section must be checked separately. Checking is performed per Table 2 of IS 800:2007 as indicated in the following figure:
Figure 493: Different portions of the cross section to be checked for section classification

1. Outstanding element of top cover plate: \( \frac{b_{p1} \cdot b_f}{2t_{p1}} = 3.5 < 9.4 \varepsilon = 9.4 \) hence, plastic.

2. Internal element of top cover plate: \( \frac{b_f}{t_{p1}} = 18 < 29.3 \varepsilon = 29.3 \) hence, plastic.

3. Internal element of top flange \( \frac{b_f}{2t_f} = 5.23 < 29.3 \varepsilon = 29.3 \) hence, plastic.

4. Internal element of bottom flange \( \frac{b_f}{2t_f} = 5.23 < 29.3 \varepsilon = 29.3 \) hence, plastic.

5. Internal element of bottom cover plate \( \frac{b_f}{t_{p2}} = 18 < 29.3 \varepsilon = 29.3 \) hence, plastic.

6. Outstanding element of bottom cover plate \( \frac{b_{p2} \cdot b_f}{2t_{p2}} = 1 < 9.4 \varepsilon = 9.4 \) hence, plastic.

7. Web of ISMB section \( \frac{d_2}{t_w} = 45.65 < 84 \varepsilon = 84 \) hence, plastic.

Overall classification of the section is based on the most critical class among the different classes identified above. Here, the overall section is classified as “plastic”.

Since \( t_f = 17.2 \text{ mm} < 40 \text{ mm} \)

Hence, from Table 10, as per the requirements of welded I section, the buckling class about major axis buckling is “b” and the same about minor axis buckling is “c”.

Check Slenderness Ratio \( k_y = k_z = 1 \)

The maximum allowable slenderness ratio is 180.

Slenderness ratio about the major axis, \( k_z L / r_z = 1.0 \times 500 / 21.8 = 22.9 < 180 \)
Slenderness ratio about the minor axis, \( k_yL / r_y = 1.0 \times 500 / 4.63 = 108.0 < 180 \)
So the slenderness is within the limit.

**Axial Tension Capacity**

Check for yielding of gross section:
\[
T_{dg} = A_g \times f_y / \gamma_m = 3,545 \, \text{kN}
\]

Check for rupture of critical section:
\[
\alpha = 0.8
\]
\[
T_{dn} = \alpha \times A_{net} \times f_u / \gamma_m = 4,193 \, \text{kN}
\]
Block shear areas are not specified and therefore not checked.

No tension in the member, so critical ratio is 0.

**Check Axial Compression**

Axial compression capacity of major axis:

The non-dimensional slenderness ratio, \( \lambda_z = \sqrt{\frac{f_y \left( k_zL / r_z \right)^2}{E \pi^2}} = 0.255 \)

For buckling class “b”, the imperfection factor, \( \alpha = 0.34 \)
\[
\phi_z = 0.5 \left[ 1 + \alpha (\lambda_z \cdot 0.2) + \lambda_z^2 \right] = 0.542
\]
\[
X_z = \frac{1}{\phi_z + \sqrt{\phi_z^2 - \lambda_z^2}} = 0.981
\]

So, as per Cl. 7.1.2.1 of IS 800:2007, \( f_{cdz} = \min \left( \frac{x_z f_y}{\gamma_m} \right) = 222.9 \, \text{MPa} \)

Therefore, axial compression capacity in the major axis: \( P_{dz} = A_x f_{cdz} = 3,477 \, \text{kN} \)

Axial compression capacity of minor axis:

The non-dimensional slenderness ratio, \( \lambda_y = \sqrt{\frac{f_y \left( k_yL / r_y \right)^2}{E \pi^2}} = 1.201 \)

For buckling class “c”, the imperfection factor, \( \alpha = 0.49 \)
\[
\phi_y = 0.5 \left[ 1 + \alpha (\lambda_y \cdot 0.2) + \lambda_y^2 \right] = 1.467
\]
\[
X_y = \frac{1}{\phi_y + \sqrt{\phi_y^2 - \lambda_y^2}} = 0.433
\]

So, as per Cl. 7.1.2.1 of IS 800:2007, \( f_{cdy} = \min \left( \frac{x_y f_y}{\gamma_m} \right) = 98.43 \, \text{MPa} \)

Therefore, axial compression capacity in the minor axis: \( P_{dy} = A_y f_{cdy} = 1,536 \, \text{kN} \), which governs.

The critical ratio for axial compression in minor axis = 23.98 / 1,536 = 0.007

**Check Shear Capacity**

Major Axis
As per Cl. 8.4.1.1 of IS 800:2007, the shear area, $A_{vz} = 2 \times b_f t_f + b_{p1} t_{p1} + b_{p2} t_{p2} = 10,692 \text{ mm}^2$

So, as per Cl. 8.4.1, $V_{pz} = \frac{A_{vz} f_y w}{\sqrt{3}} = 1,543 \text{ kN}$

Hence, shear capacity along major axis: $V_{dz} = \frac{V_{pz}}{\gamma_{m0}} = 1,403 \text{ kN}$

Minor Axis

As per Cl. 8.4.1.1 of IS 800:2007, the shear area, $A_{vy} = d_w t_w = 4,749 \text{ mm}^2$

So, as per Cl. 8.4.1, $V_{py} = \frac{A_{vy} f_y w}{\sqrt{3}} = 685.5 \text{ kN}$

Hence, shear capacity along major axis: $V_{dy} = \frac{V_{py}}{\gamma_{m0}} = 623.2 \text{ kN}$

As per Cl. 8.4.2, $d_w / t_w = 45.65 < 67\epsilon$, so resistance to shear buckling need not be checked.

Shear force along major axis = 2 kN.

Critical shear ratio along major axis: $2 / 1,403 = 0.001$

Shear force along minor axis = 1.2 kN.

Critical shear ratio along minor axis: $1.2 / 623.2 = 0.002$

Check Bending Capacity

Since the section has been classified as “plastic”, $\beta_b = 1$.

The section is low shear in both axes.

Major Axis Bending

$$\frac{\beta_b Z_{py} f_y}{\gamma_{m0}} = 724.9 \text{ kN m}$$

Actual bending moment about the major axis is $M_z = 55.98 \text{ kN m}$.  

The critical bending ratio in the major axis is $55.98 / 724.9 = 0.077$

Minor Axis Bending

$$\frac{\beta_b Z_{py} f_y}{\gamma_{m0}} = 124.3 \text{ kN m}$$

Actual bending moment about the minor axis is $M_z = 10 \text{ kN m}$.  

The critical bending ratio in the minor axis is $10 / 124.3 = 0.080$

Check Combined Interaction of Axial Compression and Bending

Section strength calculation as per Cl. 9.3.1:

$$n = \frac{N}{N_d} = 0.007 < 0.2$$

Hence, from Table 17:

$$\alpha_1 = \max(5n, 1) = 1$$

$$\alpha_2 = 2$$

As per 9.3.1.2(b),
\[ a = \frac{A - 2b f_f}{A} = 0.603 \]

\[ n_1 = \max(n, a) = 0.603 \]

\[ M_{ndy} = \min M_{dy} \left[ 1 - \left( \frac{n_1 - a}{1 - a} \right)^2 \right] = 124.3 \, \text{kN} \cdot \text{m} \]

\[ M_{ndz} = \min M_{dz} \left( \frac{1 - n}{1 - 0.3a} \right) = 724.2 \, \text{kN} \cdot \text{m} \]

Therefore:

\[ \left( \frac{M_y}{M_{ndy}} \right)^{a_1} + \left( \frac{M_z}{M_{ndz}} \right)^{a_2} = \left( \frac{10}{124.3} \right)^{1} + \left( \frac{55.98}{724.2} \right)^{2} = 0.086 \]

Overall member strength in bending and axial compression

\[ n_y = \frac{F_x}{P_{dy}} = 0.016 \]

\[ n_z = \frac{F_x}{P_{dz}} = 0.007 \]

\[ K_y = \min \left[ 1 + (\lambda_y \cdot 0.2)n_y = 1 + (1.201 - 0.2) \times 0.016 = 1.016 \right] \]

\[ K_z = \min \left[ 1 + (\lambda_z \cdot 0.2)n_z = 1 + (0.255 - 0.2) \times 0.007 = 1.000 \right] \]

\[ \frac{P}{P_{dz}} + 0.6 K_y \frac{C_{my} M_y}{M_{dy}} + K_z \frac{C_{mz} M_z}{M_{dz}} = 0.120 \]

V. IS 800 2007 LSD - Pipe - Tension and Bending

Verify the design of a pipe section subject to axial tension and biaxial bending per the IS 800:2007 limit state method.

Details
The member is a 3 m long cantilever subject to a 10 kN tensile force and uniform bending moments of 1 kN/m along both major and minor axes. The section used is a 90 mm nominal bore with a wall thickness of 3.6 mm (STAAD.Pro section designation PIP10106L) and is braced to prevent lateral-torsional buckling. The steel has a yield strength of 250 MPa, an ultimate tensile strength of 420 MPa, and a modulus of elasticity of $205 \times (10)^3$ MPa.

Validation

Section Properties
Outer diameter, $OD = 101.6$ mm
Wall thickness, $t = 3.6$ mm
Inner diameter, $ID = 101.6 - 2 \times 3.6 = 94.4$ mm
Cross-section area, $A_x = \frac{\pi}{4} (101.6^2 - 94.4^2) = 11.08$ cm$^2$
Moment of inertia about both axes, $I = \frac{n}{64} (101.6^4 - 94.4^4) = 133.2$ cm$^4$
Radius of gyration about both axes, $r = \sqrt{\frac{I}{A_x}} = 3.47$ cm
Elastic section modulus about both axes, $Z_e = \frac{I}{OD/2} = 26.23$ cm$^3$
Plastic section modulus about both axes, $Z_p = \frac{1}{6} (101.6^3 - 94.4^3) = 34.6$ cm$^3$

Constants
$\gamma_m0 = 1.1$
$\gamma_m1 = 1.25$

Section Classification
\[ \varepsilon = \sqrt{\frac{250}{f_y}} = 1 \]
For circular, hollow tubes subjected to moment, $OD/t = 28.22 < 42\varepsilon^2 = 42$
Therefore, the classification of the section is “plastic”.
Hence, from Table 10 of IS 800:2007, the buckling class about both axes is “a”.

Check Slenderness Ratio
$k_y = k_z = 1$
The maximum allowable slenderness ratio is 180.
Slenderness ratio about both axes, $k_zL / r_z = 86.67 < 180$
So the slenderness is within the limit.
### Axial Tension Capacity

Check for yielding of gross section per Cl. 6.2:

\[
T_{dg} = A_g \times f_y / \gamma_m = 11.08 \times 250 / 1.1 = 251.8 \text{ kN}
\]

Check for rupture of critical section per Cl. 6.3:

\[
\alpha = 0.8
\]

\[
T_{dn} = \alpha \times A_{net} \times f_u / \gamma_m = 0.8 \times 11.08 \times 420 / 1.25 = 297.8 \text{ kN}
\]

Block shear areas are not specified and therefore not checked.

The critical tension ratio \(10 / 251.8 = 0.040\)

### Check Axial Compression

The non-dimensional slenderness ratio, \(\lambda_z = \sqrt{\frac{f_y (k_z L / r_z)^2}{n^2 E}} = 0.961\)

For buckling class "a", the imperfection factor, \(\alpha = 0.21\)

\[
\phi_z = 0.5 \left[ 1 + \alpha (\lambda_z - 0.2) + \lambda_z^2 \right] = 1.042
\]

\[
X_z = \frac{1}{\phi_z \cdot \sqrt{\phi_z \cdot \lambda_z^2}} = 0.692
\]

So, as per Cl. 7.1.2.1 of IS 800:2007, \(f_{cdz} = \min \left( X_z \frac{f_y}{\gamma_m}, \frac{f_y}{\gamma_m} \right) = 157.3 \text{ MPa}\)

Therefore, axial compression capacity for both axes: \(P_{dz} = A_{fcdz} = 147.3 \text{ kN}\)

The critical ratio for axial compression is 0 (i.e., no compression).

### Check Shear Capacity

As per Cl. 8.4.1.1 of IS 800:2007, the shear area, \(A_{usz} = 2 \times A_x / \pi = 7.054 \text{ cm}^2\)

So, as per Cl. 8.4.1, \(V_{pz} = \frac{A_{usz} f_y w_3}{\sqrt{3}} = 101.8 \text{ kN}\)

Hence, shear capacity along major axis: \(V_{dz} = \frac{V_{pz}}{\gamma_m} = 92.56 \text{ kN}\)

Shear force along both axes = 3 kN.

Critical shear ratio along both axes: \(3 / 92.56 = 0.032\)

### Check Bending Capacity

Since the section has been classified as "plastic", \(\beta_b = 1\).

Actual shear force in both axes, \(V = 3 \text{ kN} < 0.6 V_d = 55.53 \text{ kN}\). Hence, the section is subjected to low shear.

\[
\frac{\beta_b Z_{py} f_y}{\gamma_m} = 7.861 \text{ kN} \cdot \text{m}
\]

\[
\frac{1.5 Z_{ey} f_y}{\gamma_m} = 8.925 \text{ kN} \cdot \text{m}
\]

So, the governing bending strength with respect to the minor axis is \(M_{dy} = 7.861 \text{ kN} \cdot \text{m}\)
Actual bending moment about the minor axis is $M_z = 4.5 \text{ kN} \cdot \text{m}$.

The critical bending ratio in the minor axis is $4.5 / 7.861 = 0.572$

Check Combined Interaction of Axial Compression and Bending

Section strength calculation as per Cl. 9.3.1:

$$n = \frac{N}{N_d} = 0.004$$

Hence, from Table 17:

$$\alpha_1 = 2$$
$$\alpha_2 = 2$$

$$M_{ndy} = M_{dy} = 9.341 \text{ kN} \cdot \text{m}$$

$$(\frac{M_y}{M_{ndy}})^{\alpha_1} + (\frac{M_{yz}}{M_{ndz}})^{\alpha_2} = (4.5 \frac{7.861}{7.861})^2 + (4.5 \frac{7.861}{7.861})^2 = 0.655$$

Overall member strength in bending and axial compression

$$M_{eff} = M_z - \psi F_z \frac{Z_e}{A_x} = 4.5 - \frac{1.0 \times 10 \times 26.23}{11.08 \times 10^2} = 4.264 \text{ kN} \cdot \text{m}$$

$$M_{eff} / M_{dz} = 4.263 / 7.861 = 0.542$$

The loading and section is the same in both axes.

**STAAD.Pro Input**

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\India\IS 800 2007 LSD - Pipe - Tension and Bending.STD` is typically installed with the program.

The following [D8.A.4 Design Parameters](on page 1610) are used:

- The default value of \( \text{ALPHA} \) is used.
- The default values of \( \text{KY} \) and \( \text{KZ} \) are used.
- The default value of the maximum allowable slenderness ratio, \( \text{MAIN} \), of 180 is used.
- The default value of \( \Psi \).  
- The beam type is a cantilever, specified by \( \text{CAN} \ 1 \)
- The beam is laterally supported, specified by \( \text{LAT} \ 1 \)

V. IS 800 2007 - LSD Rod Compression and Bending

Verify the program-calculated design results for a 3 m long cantilever beam, subjected to axial compression and biaxial bending. The beam section used is a 50 mm diameter steel rod and is designed as per IS 800:2007.

Details

The 3 m cantilever section is subject to a 10 kN axial compression load at the free end as well as 1 kN/m uniform loads along the length in both the “major” and “minor” axes. The cantilever is assumed to be laterally supported.

The steel yield stress is \( f_y = 250 \text{ MPa} \), the specified minimum tensile strength is \( F_{ut} = 420 \text{ MPa} \), and the modulus of elasticity is \( E = 205(10)^3 \text{ MPa} \).

Validation

Section Properties

Gross area:

\[
A_g = \frac{n(5 \text{ cm})^2}{4} = 19.6 \text{ cm}^2
\]

Moment of inertia:
$I_y = I_z = \frac{n(5 \text{ cm})^4}{64} = 30.7 \text{ cm}^4$

Elastic section modulus:

$$Z_e = \frac{I}{D^2} = 12.28 \text{ cm}^3$$

Plastic section modulus:

$$Z_p = \frac{(5 \text{ cm})^3}{6} = 20.83 \text{ cm}^3$$

Radius of gyration:

$$r_{yy} = r_{zz} = \sqrt{\frac{I}{A_g}} = 1.252 \text{ cm}$$

**Partial Safety Factors**

Partial safety factor for failure in tension by yielding (per Table 5 of IS:800 2007), $\gamma_{m0} = 1.1$.

Partial safety factor for failure at ultimate stress (per Table 5 of IS:800 2007), $\gamma_{m1} = 1.25$.

**Forces**

Axial force, $F_x = 10 \text{ kN}$

Shear forces, $F_y = F_z = 1 \text{ kN/m} \times 3 \text{ m} = 3 \text{ kN}$

Moments, $M_y = M_z = \frac{(1 \text{ kN/m}) \times (3 \text{ m})^2}{2} = 4.5 \text{ kN m}$

**Section Classification**

Although Table 2 of IS800:2007 does not specify the classification for solid rod sections, the width to thickness ratio for a solid rod is 1.0. Hence, it is a Class 1 section (Plastic).

**Check Slenderness Ratio**

$$K_y = K_z = 1$$

The allowable slenderness ratio is 180.

$$\frac{k_y L}{r_{yy}} = \frac{k_z L}{r_{zz}} = \frac{1.0 \times 300 \text{ cm}}{1.252 \text{ cm}} = 239.7 > 180$$

Section fails in slenderness.

**Check Axial Tension**

The design strength in tension (or compression) due to yielding (per Section 6),

$$T_{dg} = N_d = \frac{A_g \times F_y}{\gamma_{m0}} = \frac{19.6 \times (10)^{-4} \text{ m}^2 \times 250 \times (10)^3 \text{kN}}{1.1} = 445.5 \text{ kN}$$

Assume that $A_{net} = A_g$ and $a = 0.8$, the design strength in rupture of critical section,

$$T_{dn} = a \times A_{net} \frac{F_u}{\gamma_{m1}} = 0.8 \times 19.6 \times (10)^{-4} \text{ m}^2 \times \frac{420 \times (10)^3 \text{kN}}{1.25} = 526.8 \text{ kN}$$

**Check Axial Compression**

Per Section 7 of IS: 800-2007
Euler buckling stress, \( f_{cc} = \frac{n^2 E}{(KLr)^2} = \frac{n^2 \times 205(10)^3 \text{MPa}}{(239.7)^2} = 35.21 \text{ MPa} \)

Non-dimensional effective slenderness ratio, \( \lambda = \sqrt{\frac{f_y}{f_{cc}}} = \sqrt{\frac{250 \text{ MPa}}{35.21 \text{ MPa}}} = 2.665 \)

The imperfection factor given in Table 7; for buckling class (as per Table 10 for solid sections), \( a = 0.49 \).

\[ \phi = 0.5[1 + a(\lambda - 0.2) + \lambda^2] = 4.654 \]

\[ \chi = \frac{1}{\phi + \sqrt{\phi^2 - \lambda}} = 0.118 \]

The design compressive stress,

\[ f_{cd} = \chi \frac{f_y}{m_0} = 0.118 \times \frac{250}{1.1} = 26.84 \text{ MPa} < \frac{f_y}{m_0} = \frac{250}{1.1} = 227.3 \text{ MPa} \]

The design compressive strength,

\[ P_d = A_g f_{cd} = 19.6 \times (10)^{-4} \text{ m}^2 \times 26.84 \times (10)^3 \text{ kN} / \text{ m}^2 = 52.6 \text{ kN} \]

Design ratio in compression: \( \frac{F_x}{P_d} = \frac{10}{52.6} = 0.19 \) (for both local z and y axes)

Check for Shear

Per Cl 8.4 and 8.4.1 of IS: 800-2007

Per Cl. 8.4.1.1, the shear area is taken as the gross area of the solid round section; \( A_v = A_g = 19.6 \text{ cm}^2 \).

The shear force used for design is taken as the resultant SRSS combination of the “major” and “minor” axes:

\[ V_u = \sqrt{(F_y)^2 + (F_x)^2} = \sqrt{(3 \text{ kN})^2 + (3 \text{ kN})^2} = 4.243 \text{ kN} \]

The plastic under pure shear is taken as the nominal shear strength,

\[ V_p = A_v \frac{f_{yw}}{\sqrt{3}} = 19.6 \times (10)^{-4} \text{ m}^2 \times \frac{250 \times (10)^3}{\sqrt{3}} = 282.9 \text{ kN} \]

\[ V_d = \frac{V_p}{y_{m_0}} = \frac{282.9 \text{ kN}}{1.1} = 257.2 \text{ kN} \]

Design ratio in shear: \( \frac{V_u}{V_d} = \frac{4.654}{257.2} = 0.016 \)

Check for Bending

Per Section 8 of IS: 800-2007

The bending moment used for design is taken as the resultant SRSS combination of the “major” and “minor” axes:

\[ M' = \sqrt{(M_y)^2 + (M_z)^2} = \sqrt{(4.5 \text{ kN} \text{ m})^2 + (4.5 \text{ kN} \text{ m})^2} = 6.364 \text{ kN} \text{ m} \]

This is used as the “major” axis bending moment and the “minor” axis bending moment is taken as zero.

When \( V < 0.6V_d \) on a cantilever beam, then the design bending strength is taken as:
\[ V_u = 4.343 \text{kN} < 0.6 (257.2 \text{kN}) = 154.3 \text{kN} \]

\[ M_d = \frac{\beta_b \times Z_p \times F_y}{\gamma_{m0}} < \frac{1.5 \times Z_e \times F_y}{\gamma_{m0}} \]

where \[ \beta_b = 1 \]

\[ M_d = \frac{1.0 \left( 20.83 \times 10^{-6} \text{m}^3 \right) \left( 250 \times 10^3 \text{kN} / \text{m}^2 \right)}{1.1} = 4.734 \text{kN m} \]

\[ M_d = \frac{1.5 \left( 12.28 \times 10^{-6} \text{m}^3 \right) \left( 250 \times 10^3 \text{kN} / \text{m}^2 \right)}{1.1} = 4.186 \text{kN m} \]

Design ratio in bending: \[ \frac{M'}{M_d} = \frac{6.364}{4.186} = 1.52 \]

Check for Combined Axial Force

Check the reduced flexural strength under combined axial force and the respective uniaxial moment acting alone (Cl. 9.3.1.2).

The ratio for the compression yielding is \( n = \frac{N}{N_d} = 0.022 \)

\[ M_{nd, \text{max}} = 1.04 \times M_d (1 - n^{1.7}) = 1.04 \times 4.186 \text{kN m} (1 - 0.022^{1.7}) = 4.347 \text{kN m} \]

Use \( M_d = 4.186 \text{kN m} \).

The combined bending ratio is taken as:

\[ \left( \frac{M'}{M_{nd,y}} \right)^{a_1} + \left( \frac{M'}{M_{nd,z}} \right)^{a_2} \]

where

\[ a_1 = 1 \]
\[ a_2 = 1 \]

\[ \left( \frac{0.19}{4.186} \right)^{1.0} + \left( \frac{6.364}{4.186} \right)^{1.0} = 1.52 \]

Check for Combined Axial Force and Bending Moment

Per Cl 9.3.2.2 of IS: 800-2007

\[ K_y = K_z = \min \left( 1 + (1 - 0.2)n, 1 + 0.8n \right) = 1 + (2.665 - 0.2)0.19 = 1.468 \]
\[ 1 + 0.8n = 1 + 0.8 \times 0.19 = 1.152 \]

\[ K_{LT} = 1.0 \]

\[ \frac{P}{P_{dy}} + K_y \left( \frac{C_{my} \times M_y}{M_{dy}} \right) + K_{LT} \frac{M_z}{M_{dz}} = 0.19 + 1.152 \left( \frac{0.9 \times 4.5}{4.186} \right) + 1.0 \times \frac{4.5}{4.186} = 2.380 \]

\[ \frac{P}{P_{dy}} + K_y \left( \frac{C_{my} \times M_y^2 + M_z^2}{M_{dy}} \right) + 0 = 0.19 + 1.152 \left( \frac{0.9 \times 4.5^2 + 4.5^2}{4.186} \right) + 0 = 1.766 \]

\[ \frac{P}{P_{dz}} + 0.6K_y \left( \frac{C_{my} \times M_y}{M_{dy}} \right) + K_z \left( \frac{C_{mz} \times M_z}{M_{dz}} \right) = 0.19 + 0.6 \times 1.152 \left( \frac{0.9 \times 4.5}{4.186} \right) + 1.152 \left( \frac{0.9 \times 4.5}{4.186} \right) = 1.973 \]

#### STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\India\IS 800 2007 LSD - ROD - Compression and Bending.STD` is typically installed with the program.

The following D8.A.4 Design Parameters (on page 1610) are used:

- The lateral support condition is specified by LAT 1
- The cantilever member is specified by CAN 1

### V. IS 800 2007 - WSD Rod Compression and Bending

Verify the program-calculated design results for a 3 m long cantilever beam, subjected to axial compression and biaxial bending. The beam section used is a 50 mm diameter steel rod and is designed as per IS 800:2007 working stress design method.

**Details**

The 3 m cantilever section is subject to a 10 kN axial compression load at the free end as well as 1 kN/m uniform loads along the length in both the "major" and "minor" axes. The cantilever is assumed to be laterally supported.
The steel yield stress is $f_y = 250 \text{ MPa}$, the specified minimum tensile strength is $F_u = 420 \text{ MPa}$, and the modulus of elasticity is $E = 205(10)^3 \text{ MPa}$

Validation
Section Properties

Gross area:

$$A_g = \frac{\pi (5 \text{ cm})^2}{4} = 19.6 \text{ cm}^2$$

Moment of inertia:

$$I_y = I_z = \frac{\pi (5 \text{ cm})^4}{64} = 30.7 \text{ cm}^4$$

Elastic section modulus:

$$Z_e = \frac{I}{D} = \frac{206}{12} = 12.28 \text{ cm}^3$$

Plastic section modulus:

$$Z_p = \frac{(5 \text{ cm})^3}{6} = 20.83 \text{ cm}^3$$

Radius of gyration:

$$r_{yy} = r_{zz} = \sqrt{\frac{I}{A_g}} = 1.252 \text{ cm}$$

Partial Safety Factors

Partial safety factor for failure in tension by yielding (per Table 5 of IS:800 2007), $\gamma_{m0} = 1.1$.

Partial safety factor for failure at ultimate stress (per Table 5 of IS:800 2007), $\gamma_{m1} = 1.25$.

Forces

Axial force, $F_x = 10 \text{ kN}$

Shear forces, $F_y = F_z = 1 \text{ kN/m} \times 3 \text{ m} = 3 \text{ kN}$

Moments, $M_y = M_z = \frac{(1 \text{ kN/m}) \times (3 \text{ m})^2}{2} = 4.5 \text{ kN} \cdot \text{m}$

Section Classification

Although Table 2 of IS800:2007 does not specify the classification for solid rod sections, the width to thickness ratio for a solid rod is 1.0. Hence, it is a Class 1 section (Plastic).

Check Slenderness Ratio

$K_y = K_z = 1$

The allowable slenderness ratio is 180.

$$\frac{k_y L}{r_{yy}} = \frac{k_z L}{r_{zz}} = \frac{(1.0) \times 300 \text{ cm}}{1.252 \text{ cm}} = 239.7 > 180$$

Section fails in slenderness.

Check Axial Tension
The permissible stress in compression/tension due to yielding (per Section 11.2.1(a)),
\[ f_{atg} = 0.6f_y = 0.6 \times 250 \text{ MPa} = 150 \text{ MPa} \]

Assume that \( A_{net} = A_g \) and \( a = 0.8 \), the design strength in rupture of critical section,
\[ T_{dn} = a \times A_{net} \frac{F_u}{\gamma_{m1}} = 0.8 \times 19.6 \times (10)^{-4} \text{ m}^2 \times \frac{420 \times (10)^{3} \text{kN}}{1.25 \text{m}^2} = 526.8 \text{ kN} \]

The permissible stress governed by rupture of the net section,
\[ f_{att} = 0.69 \frac{T_{dn}}{A_g} = 0.69 \frac{526.8 \text{kN}(10)^3}{19.6 \times (10)^{-4} \text{m}^2} = 185.5 \text{ MPa} \]

Check Axial Compression

Per section 11.3 of IS:800 2007.

The actual compression under service load,
\[ f_c = \frac{P_s}{A_e} = \frac{F_x}{A_g} = \frac{10 \text{kN} \times (10)^3}{19.6 \times (10)^{-4} \text{m}^2} = 51.02 \text{ MPa} \]

Euler buckling stress,
\[ f_{cc} = \frac{\pi^2 E}{(KL/r_p)^2} = \frac{\pi^2 \times 205(10)^3 \text{MPa}}{(239.7)^2} = 35.21 \text{ MPa} \]

Non-dimensional effective slenderness ratio,
\[ \lambda = \frac{\frac{f_y}{f_{cc}} 250}{35.21 \text{MPa}} = 2.665 \]

The imperfection factor given in Table 7; for buckling class (as per Table 10 for solid sections), \( a = 0.49 \).
\[ \phi = 0.5[1 + a(\lambda - 0.2) + \lambda^2] = 4.654 \]
\[ \chi = \frac{1}{\phi + \sqrt{\phi^2 \cdot \lambda^2}} = 0.118 \]

The design compressive stress,
\[ f_{cd} = \chi \frac{f_y}{\gamma_{m0}} = 0.118 \times 250 \frac{1.1}{1.1} = 26.84 \text{ MPa} < \frac{f_y}{\gamma_{m0}} = \frac{250}{1.1} = 227.3 \text{ MPa} \]
\[ f_{ac} = 0.6 \times f_{cd} = 0.6 \times 26.84 \text{ MPa} = 16.10 \text{ MPa} \]

Design ratio in compression: \( \frac{f_c}{f_{ac}} = \frac{51.02}{16.10} = 0.317 \) (for both local z and y axes)

Check for Shear

Per Cl 11.42 of IS:800-2007

Per Cl. 8.4.1.1, the shear area is taken as the gross area of the solid round section; \( A_v = A_g = 19.6 \text{ cm}^2 \).

The shear force used for design is taken as the resultant SRSS combination of the “major” and “minor” axes:
\[ V_u = \sqrt{(F_y)^2 + (F_z)^2} = \sqrt{(3 \text{kN})^2 + (3 \text{kN})^2} = 4.243 \text{ kN} \]

The plastic under pure shear is taken as the nominal shear strength,
\[ \tau_p = \frac{V_s}{A_v} = \frac{4.243 \text{kN}}{19.6 \times (10)^{-4} \text{m}^2} = 2.165 \text{ MPa} \]

The permissible shear stress at working load, \( \tau_{ab} = 0.4f_y = 0.4 \times 250 \text{ MPa} = 100 \text{ MPa} \)
Design ratio in shear: \( \frac{\tau_s}{\tau_{ab}} = \frac{2.165}{100} = 0.022 \)

**Check for Bending**

Per Section 11.4 of IS: 800-2007

The bending moment used for design is taken as the resultant SRSS combination of the “major” and “minor” axes:

\[
M' = \sqrt{(M_y)^2 + (M_z)^2} = \sqrt{(4.5 \text{ kN m})^2 + (4.5 \text{ kN m})^2} = 6.364 \text{ kN m}
\]

This is used as the “major” axis bending moment and the “minor” axis bending moment is taken as zero.

The actual bending stress, \( f_b = \frac{M_s Z_e}{I_e} = \frac{6.364 \text{ kN m} \times 10^3}{12.28 \text{ cm}^3} = 518.2 \text{ MPa} \)

The permissible bending stress at working load, \( f_{ab} = 0.66 f_y = 0.66 \times 250 \text{ MPa} = 165 \text{ MPa} \)

Design ratio in bending: \( \frac{f_b}{f_{ab}} = \frac{518.2}{165} = 3.141 \)

**Check for Combined Axial Force and Bending**

As per Cl. 11.5.2(a) of IS: 800-2007.

\[
C_{mLT} = 0.9
\]

\[
K_y = K_z = \min \left( 1 + \left( \frac{f_c}{f_{ac}} \right) \right) = 1 + \left( \frac{2.665 - 0.2}{0.317} \right) = 1.781
\]

\[
K_{LT} = - \frac{0.1 \left( \frac{f_c}{f_{ac}} \right)}{C_{mLT}} = - \frac{0.1(0.317)}{0.9 - 0.25} = - 0.049
\]

\[
\frac{f_c}{f_{ac}} + 0.6 K_y C_{my} \frac{f_{bcy}}{f_{acy}} + K_{LT} \frac{f_{bc}}{f_{ac}} = 0.317 + 0.6(1.254)(0.9)(0) - 0.049(3.141) = 0.163
\]

\[
\frac{f_c}{f_{ac}} + 0.6 K_y C_{my} \frac{f_{bcy}}{f_{acy}} + K_z C_{mz} \frac{f_{bcz}}{f_{ac}} = 0.317 + 0.6(1.254)(0.9)(0) + 1.254(0.9)(3.141) = 3.862
\]

As per Cl. 11.5.2(b) of IS: 800-2007.

\[
\frac{f_c}{0.6 f_y} + \frac{f_{bcy}}{f_{acy}} + \frac{f_{bcz}}{f_{ac}} = \frac{5.102}{0.6(250)} + \frac{0}{165} + 3.141 = 3.175
\]

**Results**

### STAAD.Pro Input

The file C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\India\IS 800 2007 WSD - ROD - Compression and Bending.STD is typically installed with the program.

The following **D8.A.4 Design Parameters** (on page 1610) are used:

- The lateral support condition is specified by **LAT 1**
- The cantilever member is specified by **CAN 1**

---

*This problem has been created to validate the program calculated design results of rod section subjected to axial Compression and biaxial bending using IS 800 2007 (WSD)*

V. IS 801-Beam with axial and major axis bending

Verification example for a cold-formed beam subject to axial compression and bending moment according to IS: 801-1975.

Details
Verifies the calculations for an IS 60CU40x4 (Channel without lips) beam that is 2 m long and subject to axial compression and major axis bending moment. This example checks for compression, shear, bending and compression and bending interaction as per IS 801.

Material properties:

\[ E = 2,074,000 \text{ kgf/cm}^2 = 203,400 \text{ MPa} \]

\[ F_{y,i} = 350.0 \text{ MPa} = 3,569 \text{ kgf/cm}^2 \]

\[ F_u = 450 \text{ MPa} \]

\[ G = 795,000 \text{ kgf/cm}^2 = 77,963 \text{ MPa} \]

Design forces:

\[ P = 0.5 \text{ kN} \]

\[ M_z = 0.748 \text{ kN·m} \]

\[ V_y = 1.874 \text{ kN} \]

Verification

Section Dimension Checks

Check for flat width ratio:

\[ w = b - (r + t) = r - (0.4 + 0.6) = 3 \text{ mm} \]

\[ w/t = 3 / 0.4 = 7.5 < 60 \]

Hence, OK (ref. cl 5.2.3(a))

Check for web height to thickness ratio:

\[ h/t = (d - 2\times t_f - 2\times \text{ root radius}) / t = (6 - 2\times 0.4 - 2\times 0.6)/0.4 = 10 < 500 \]

Hence, OK (ref. cl 5.2.3(b))

Check for web height to thickness ratio:

\[ h/t = (6 - 2\times 0.4) / 0.4 = 13 < 150 \]

Hence, OK (ref. cl 5.2.4(a))

Check for limiting slenderness

\[ k \frac{L}{r_y} = 1.0 \frac{200 \text{ mm}}{1263 \text{ mm}} = 158.3 < 200 \]

Hence, OK (ref. cl 6.3.3)

Calculation of Allowable Compressive Stress

For calculation of axially loaded member, “Q” is an important factor. The definition and method of calculation for value of Q is provided in Clause no. 6.6.1.1 (a). Channel section without lips is a combination of stiffened & unstiffened elements.
As per clause no 6.1.1.1 of IS801, the increase of steel strength happens due to cold work of forming.

Total corner area, \( A_{\text{corner}} = 2 (45.2 \, \text{mm}^2) = 91.2 \, \text{mm}^2 = 0.912 \, \text{cm}^2 \)

Total area of flanges, \( A_{\text{flange}} = 2 \times b \times t = 2 (0.4) (0.4) = 3.2 \, \text{cm}^2 \)

\[ C = \frac{A_{\text{corner}}}{A_{\text{flange}}} = 0.931 / 3.2 = 0.285 \]

Effective depth, \( h_e = h = 4 \, \text{cm} \)

Therefore, effective area, \( A_e = A = 4.91 \, \text{cm}^2 \)

\[ B_e = 3.69 \frac{F_u}{F_y} \cdot 0.819 \left( \frac{F_u}{F_y} \right)^2 \cdot 1.79 = 1.6004 \]

\[ m = 0.192 \frac{F_u}{F_y} \cdot 0.068 = 0.1789 \]

Tensile yield point of corner, \( F_{yc} = \frac{B_e \times F_y}{r \cdot m} = 521.0 \, \text{MPa} \)

Tensile yield point of flat portions, \( F_{yt} = F_y = 350.0 \, \text{MPa} \)

Average yield point of cold-forming for tension/compression members, \( F_{ya(\text{compression})} = (C \times F_{yc}) + (1 - C) \times F_{yc} = 381.8 \, \text{MPa ( = 3,893 kgf/cm}^2 \)

Average yield point of cold-forming for flexural members, \( F_{ya(\text{bending})} = (C \times F_{yc}) + (1 - C) \times F_{yc} = 398.8 \, \text{MPa} \)

\[ w = 3 \, \text{cm} \]

\[ w / t = 7.5 \]

As per cl. 6.2 of IS 801, compressive stress:

\[ F_c = 0.6 \times F_{ya} = 0.6 \times 381.8 = 229.1 \, \text{MPa} \]

\[ Q_s = \frac{F_c}{0.6F_{ya}} = \frac{229.1}{229.1} = 1 \]

\[ h = d - 2(r + t) = 4 \, \text{cm} \]

\[ h / t = 13 < \frac{1435}{\sqrt{F_c}} = 29.69 \]

\[ Q_a = \frac{A_e}{A} = 1 \]

\[ Q = Q_s \times Q_a = 1 \]

Allowable compression stress, \( F_{a1} \), for members braced against twisting (ref. cl 6.6.1.1)

\[ C_e = \sqrt{\frac{2\pi E}{F_{ya}}} = 102.5 \]

\[ \frac{C_e}{\sqrt{Q}} = 102.5 \]

Slenderness ratio \( KL/r = 158.3 \)

\[ F_{a1} = \frac{12}{23} Q \times F_{ya} \cdot \frac{3(Q \times F_{ya}) (KL/r)^2}{23n^2E} = 41.06 \, \text{MPa} \]
Maximum allowable compressive stress (Fa2) for flexural-torsional buckling (ref. cl 6.6.1.2 of IS 801)

\[ r_0 = \sqrt{r_x^2 + r_y^2 + x_0^2} = 3.732 \text{ cm} \]

\[ \sigma_x = \frac{n^2 \times E}{K_x r_x} = 274.8 \text{ MPa} \]

\[ \beta = 1 - \left( \frac{x_0}{r_x} \right)^2 = 0.5071 \]

\[ \sigma_t = \frac{1}{A \times r_o^2} \times \frac{(G \times J) + (n^2 \times E \times C_w)}{(K_x \times L)^2} = 324.2 \text{ MPa} \]

\[ \sigma_{TF0} = \frac{1}{2\beta} \left[ (\sigma_{ex} + \sigma_t) \cdot \sigma_{ex} + \sigma_t \right] = 174.5 \text{ MPa} \]

\[ F_y = F_y \times Q = 381.8 \text{ MPa} \]

\[ F_{a2} = 0.522 \times \sigma_{TF0} = 91.09 \text{ MPa} \]

The allowable compressive stress, \( F_a \), is the minimum of \( F_{a1} \) and \( F_{a2} \):

\[ F_a = 41.06 \text{ MPa} \]

**Calculation of Allowable Bending Stress**

As per clause number 6.1, maximum allowable stress on extreme fiber is:

\[ F = 0.6 \times F_{ya(\text{compression})} = 0.6 \times 381.8 \text{ MPa} = 229.1 \text{ MPa} \]

As the section is channel without lips, the flanges are unstiffened. So, as per clause 6.2 we need to check allowable compressive stress on the unstiffened element.

\[ \frac{w}{t} = 7.5 < \frac{530}{\sqrt{F_{ya}}} = \frac{530}{\sqrt{3893 \text{ kgf/cm}^2}} = 8.494 \]

Also, the yield strength of steel, \( F_y > 2,230 \text{ kgf/cm}^2 = 227.5 \text{ MPa} \).

\[ F_c = 0.6 \times F_{ya(\text{compression})} = 229.1 \text{ MPa} \]

For the major axis bending, the allowable compressive stress, \( F_{bc} \), is the minimum of \( F \) and \( F_c \)

\[ F_{bc} = 229.1 \text{ MPa} \]

Similarly, for major axis bending, the allowable tensile stress, \( F_{bt} = 0.6 \times F_{ya(\text{compression})} = 229.1 \text{ MPa} \)

Calculate the allowable bending stress for laterally unbraced beams:

Allowable bending stress for laterally unbraced beams has been calculated as per clause 6.3 (a).

Unsupported length, \( L = 2 \text{ m} \) (the UNL parameter can be used for this).

\[ S_{xc} = Z_{xx} = 8.93 \text{ cm}^3 \]

\[ C_b = 1.0 \text{ for a member under compression and bending.} \]

\[ \frac{L^2 \times S_{xc}}{d \times F_{yc}} = 14,140 > 1.8n^2 E \frac{C_b}{F_{ya(\text{compression})}} = 9,464 \]
Allowable bending stress in the web:

\[ F_{bw1} = \frac{36,560,000}{(d/2)^2} = 216,330 \text{ kN/m}^2 = 21,215 \text{ MPa} \]

Per cl. 6.4.2, \( F_{bw} \) is the minimum of \( F_{bw1} \) and \( 0.6 \times F_{ya(bending)} = 239.2 \text{ MPa} \)

\[ F_{bw} = 239.2 \text{ MPa} \]

**Calculation of Allowable Shear Stress**

Per cl. 6.4:

Clear distance between flanges = \( h = d - 2t = 52 \text{ mm} \)

\[ F_{v1} = \frac{1275 \times \sqrt{F_y}}{ht} = 577.1042 \text{ MPa} \quad \text{(cl. 6.4.1(a))} \]

\[ F_{v2} = \frac{585000}{(ht)^2} = 3,395 \text{ MPa} \quad \text{(cl. 6.4.1(b))} \]

\[ \frac{h}{t} = 13 < \frac{4,590}{\sqrt{F_y}} = 76.8 \]

Allowable shear stress, \( F_v \) is the minimum of \( F_{v1} \) or \( 0.4 \times F_y = 140.1 \text{ MPa} \)

\[ F_v = 140.1 \text{ MPa} \]

**Allowable combined bending and shear stress:**

\[ \frac{ht}{F_y} < \frac{4590}{\sqrt{F_y}}, F_{ve} = F_{ve1} = 577.1 \text{ MPa} \]

**Actual Stresses**

**Compression**

\[ f_a = P/A = 0.5 \text{ kN} / 4.91 \text{ mm}^2 = 1.018 \text{ MPa} \]

**Bending**

\[ f_b = M / Z_{xx} = 0.748 \text{ kN m} / 8.93 \text{ cm}^3 = 83.76 \text{ MPa} \]

**Bending in Web**

Actual bending stress in the web is calculated by interpolation of bending stress diagram:

\[ f_{bw} = f_b \times \left(1 - \frac{t}{0.5 \times d}\right) = 72.59 \text{ MPa} \]

**Shear**

\[ f_v = \frac{V_y}{\frac{1.874(10)^3}{(14060 - 2 \times 4)} = 9.01 \text{ MPa} } \]

**Stress Ratio**

**Compression**
\[ f_a / F_a = 1.018 / 41.06 = 0.024 \]

Bending

for bending compression: \( f_b / F_{bc} = 83.76 / 229.1 = 0.366 \)
for bending tension: \( f_b / F_{bt} = 83.76 / 229.1 = 0.366 \)
for unbraced bending: \( f_b / F_b = 83.76 / 85.18 = 0.983 \)
for web bending: \( f_{bw} / F_{bw} = 72.59 / 239.2 = 0.303 \)

Shear

\[ f_v / F_v = 9.01 / 140.1 = 0.064 \]

Combined bending and shear (ref. cl 6.4.3 of IS 801):

\[
\sqrt{\left( \frac{f_{bw}}{F_{bw1}} \right)^2 + \left( \frac{f_{vy}}{F_{vy1}} \right)^2} = \sqrt{\left( \frac{75.59}{21.215} \right)^2 + \left( \frac{9.01}{577.1} \right)^2} = 0.016
\]

Interaction ratio for axial and bending

As \( Q = 1.0 \), \( F_{a0} \) can be calculated using cl. 6.6.1.1(b) with \( L = 0 \):

\[
F_{a0} = \frac{12}{23} Q \times F_{ya} \cdot \frac{3(Q \times F_{ya})^2}{23a^2E} (K^*L_r) = 182.6 \text{ MPa}
\]

\[
\frac{f_a}{F_{a0}} + \frac{f_{b1}}{F_{b1}} = \frac{1.018}{182.6} + \frac{83.76}{229.1} = 0.371 \quad (6.7.2(a) \cdot 2nd \text{ eq})
\]

Verification Examples
V.09 Steel Design

V. IS 801-Column with axial and major axis bending

Verification example for a cold-formed column subject to axial compression and bending moment according to IS:801-1975.

Details
Verifies the calculations for an IS 60CS40x4 (channel with lips) column that is 2 m long and subject to axial compression and major axis bending moment. This example checks for compression, shear, bending, and compression and bending interaction as per IS 801.

Material properties:

\[ E = 2,074,000 \text{ kgf/cm}^2 = 203,400 \text{ MPa} \]
\[ F_y = 3,569 \text{ kgf/cm}^2 = 353.0 \text{ MPa} \]
\[ F_u = 4,588 \text{ kgf/cm}^2 = 450 \text{ MPa} \]
\[ G = 795,000 \text{ kgf/cm}^2 = 77,963 \text{ MPa} \]

Design forces:

\[ P = 10 \text{ kN} \]
\[ M_z = 4.0 \text{ kN·m} \]
\[ V_y = 2 \text{ kN} \]

Verification

Section Dimension Checks

Flanges (ref. cl 5.2.3):

\[ w = 4 - 2 \times 0.4 - 2 \times 0.6 = 2 \]
\[ w/t = 2 / 0.4 = 5 < 60, \text{ Hence OK} \]

Web (ref. cl 5.2.4):

\[ W/t = (6 - 2 \times 0.4 - 2 \times 0.6) / 0.4 = 10 < 500 \text{ and} \]
\[ h/t = (6 - 2 \times 0.4) / 0.4 = 13 < 150, \text{ Hence OK} \]

Check for limiting slenderness (ref. cl 6.3.3):

\[ K \times L_y/r_y = 1.0 \times 200 \text{ mm} / 1.453 \text{ mm} = 137.6 < 200 \]

Hence, OK

Allowable Compression Strength

Maximum allowable compressive stress for flexural buckling Y (ref. cl 6.6.1.1 of IS 801)

Design stress, \( F = 0.6 \times f_y = 2,160 \text{ kgf/cm}^2 = 211.8 \text{ MPa} \)

Effective width of flange, \( B_{eff} \)

\[ W = 4 - 2 \times 0.4 - 2 \times 0.6 = 2 \text{ cm} \]
\[ \frac{w}{t} = 5 < \frac{1.435}{\sqrt{F}} = 30.87 \]
Effective width of web, \( B_{\text{eff}} \)

\[ W/t < 30.87 \]

\[ B_{\text{eff}} = w = 2 \text{ cm} \]

\[ B_{\text{eff}} = w = 10 \text{ cm} \]

\[ A_{\text{eff}} = 5.8 \text{ cm}^2 \]

Factor, \( Q = A_{\text{eff}} / A = 1.0 \)

\[ C_e = \sqrt{\frac{2\pi^2 E}{F_y}} = 106.6 \]

\[ \text{Slenderness limit} = \frac{C_e}{\sqrt{Q}} = 106.6 < 137.6 \]

\[ F_{a1} = \frac{10,680,000}{(kL/r)^2} = 564.1 \text{ kgf/cm}^2 \]

The allowable compressive stress for flexural torsional buckling (ref. cl 6.6.1.2 of IS 801)

\[ \sigma_{TF0} = \frac{1}{2\pi} \left( \sigma_{ex} + \sigma_t \right) \cdot \sqrt{\left( \sigma_{ex} + \sigma_t \right)^2 - 4\beta \times \sigma_{ex} \times \sigma_t} = 1,201 \text{ kgf/cm}^2 = 117.8 \text{ MPa} \]

\[ 1,201 \text{ kgf/cm}^2 < 0.5 \times F = 1,800 \text{ kgf/cm}^2 \]

\[ F_{a2} = 0.522 \times \sigma_{TF0} = 626.9 \text{ kgf/cm}^2 \]

The allowable compressive stress, \( F_a \) is the minimum of \( F_{a1} \) and \( F_{a1} \).

\[ F_a = 546.1 \text{ kgf/cm}^2 = 55.32 \text{ MPa} \]

**Allowable Bending Strength**

\[ C = 1.0 \] for member under combined axial and bending.

\[ F_b = \frac{3}{5} F_y \cdot \frac{F_y^2}{54\pi^2 E \cdot C_b} \left( \frac{L^2 S_{xc}}{d \times I_{yc}} \right) = 1,412 \text{ kgf/cm}^2 = 138.5 \text{ MPa} \]

Maximum allowable compressive stress:

\[ F_{b1} = 0.6 \times F_y = 2,160 \text{ kgf/cm}^2 = 211.8 \text{ MPa} \]

**Allowable Shear Strength**

\[ \frac{h}{t} = 13 < \frac{4.590}{\sqrt{F_y}} = 76.5 \]

\[ F_{v1} = \frac{1.275 \sqrt{F_y}}{(h/t)} = 5,884 \text{ kgf/cm}^2 \]

\[ F_{v2} = 0.4 F_y = 1,440 \text{ kgf/cm}^2 \]
The allowable shear stress, $F_v$, is the minimum of $F_{v,1}$ and $F_{v,2}$:

$$F_v = 1,440 \text{ kgf/cm}^2 = 141.3 \text{ MPa}$$

**Axial and Bending Interaction**

$$f_a = \frac{P}{A} = 10 \text{ kN} / 5.8 \text{ cm}^2 = 1,019.7 \text{ kgf} / 5.8 \text{ cm}^2 = 175.8 \text{ kgf/cm}^2$$

$$f_{b1} = \frac{M}{Z} = 4.0 \text{ kN m} / 9.4 \text{ cm}^3 = 40,789 \text{ kgf cm} / 9.4 \text{ cm}^3 = 4,339 \text{ kgf/cm}^2$$

$$C_{mx} = 0.6$$

$$F_e' = 1,294 \text{ kgf/cm}^2$$

$$F_a = \frac{f_a}{F_{a,1}} + \frac{f_{b1}C_{mx}}{F_{b1}} = \frac{175.8}{564.1} + \frac{4,339(0.6)}{2,160(1 \cdot 175.8 \cdot 1,294)} = 0.312 + 1.395 = 1.705$$

Hence, not OK

$$F_{a,0} = 1,879 \text{ kgf/cm}^3$$

$$F_a = \frac{f_a}{F_{a,0}} + \frac{f_{b1}}{F_{b1}} = \frac{175.8}{1,879} + \frac{4,339}{2,160} = 0.094 + 2.009 = 2.103$$

**V. IS 801-Pipe subject to axial compression and bending**

Verification example for a cold-formed beam subject to axial compression and bending moment according to IS: 801-1975.

**Details**

The section used is an ST 101.6x2.6CHS (pipe) section. The beam is a 6 m span subject to axial compression and bending moments. Both ends of the span are fixed.

Material properties:

- $E = 203,400 \text{ MPa}$
- $F_y = 353.0 \text{ MPa}$

Design forces:

- $P = \pm 2.5 \text{ kN}$
- $M_z = 3.88 \text{ kN} \cdot \text{m}$
- $V_y = 3.88 \text{ kN}$

Section properties:

- Outer diameter, $OD = 101.6 \text{ mm}$
- Thickness, $t = 2.6 \text{ mm}$
- Area, $A = 8.09 \text{ cm}^2$
- Moment of inertia about the major axis, $I_{zz} = 99.1 \text{ cm}^3$
Verification

**Section modulus about the major axis,** \( Z_{xx} = 19.51 \text{ cm}^3 \)

**Verification**

**Compressive Stress**

Radius of gyration, \( r_x = \sqrt{\frac{I_{xx}}{A}} = \sqrt{\frac{99.1}{8.09}} = 3.50 \text{ cm} \)

Allowable compression stress:

\[
C_e = \sqrt{\frac{2\pi^2 E}{F_y}} = \sqrt{\frac{2\pi^2 \times 203,404}{353.1}} = 106.6
\]

\[
Q = 1
\]

\[
\frac{C_e}{\sqrt{Q}} = \frac{106.6}{\sqrt{1.0}} = 106.6 < \frac{KL}{r} = \frac{1.0(600)}{3.50} = 171.4
\]

Therefore, the allowable compressive stress:

\[
F_c = \frac{12\pi^2 E}{23} \left(\frac{KL}{r}\right)^2 = \frac{12\pi^2 \times 203,404}{23(171.4)^2} = 35.65 \text{ MPa}
\]

Actual stress in compression

\[
f_c = \frac{P}{A} = \frac{2.5 \times 10^3}{8.09 \times 10^2} = 3.09 \text{ MPa}
\]

Stress ratio in compression: \( 3.09 / 35.65 = 0.087 \)

**Bending Stress**

Avg. diameter = 101.6 mm \( \cdot \) 2.6 mm = 99.0 mm

\[
\frac{D}{r} = \frac{99.0}{2.6} = 38.1 < \frac{232,000}{F_y} = \frac{232,000}{353.1} = 657.0
\]

Per Cl. 6.8, the maximum allowable stress in bending:

\[
F = 0.6 \times F_y = 0.6 \times 353.1 = 211.9 \text{ MPa}
\]

Actual bending stress:

\[
f_b = \frac{M}{Z_{xx}} = \frac{3.88 \times 10^3}{19.51} = 198.9 \text{ MPa}
\]

Stress ratio in bending: \( 198.9 / 211.9 = 0.939 \)

**Tensile Stress**

Allowable tension stress:

\[
F = 0.6 \times F_y = 0.6 \times 353.1 = 211.9 \text{ MPa}
\]

Actual stress in tension

\[
f_t = \frac{P}{A} = \frac{2.5 \times 10^3}{8.09 \times 10^2} = 3.09 \text{ MPa}
\]

Stress ratio in tension: \( 3.09 / 211.9 = 0.015 \)
Calculation of Allowable Shear Stress

Allowable shear stress:

\[ F_v = 0.4 \times F_y = 0.4 \times 353.1 = 141.2 \text{ MPa} \]

Shear area:

\[ A_z = 0.5 \times 2 \pi (10.16 / 2) 0.26 = 4.15 \text{ cm}^2 \]

Actual shear stress:

\[ f_v = \frac{V_y}{A_z} = \frac{3.88(10)}{4.15} = 9.349 \text{ MPa} \]

Stress ration in shear: \( 9.35 / 141.2 = 0.066 \)

### NOTE:

Torsion and deflections have not been considered in the design.

---

**V. IS 801-Zee with lips having axial compression and bending**

Verification example for a cold-formed beam subject to axial compression and bending moment according to IS: 801-1975.
Details

The section used is a IS 125ZS45x2.55 section. The beam is a 2 m span subject to axial compression and major axis bending moments. The span is a propped cantilever (one end fixed, the other pinned).

Material properties:

\[ E = 203,400 \text{ MPa} = 2,074,000 \text{ kgf/cm}^2 \]
\[ F_y = 350 \text{ MPa} = 3,569 \text{ kgf/cm}^2 \]
\[ G = 77,968 \text{ MPa} = 795,000 \text{ kgf/cm}^2 \]

Design forces:

\[ P = 25 \text{ kN} \]
\[ M_z = 2.71 \text{ kN·m} \]
\[ V_y = 6.85 \text{ kN} \]

Section properties:

Depth of section, \( d = 125 \text{ mm} \)
Width of section, \( b = 45 \text{ mm} \)
Thickness, \( t = 2.55 \text{ mm} \)
Length of lips, \( c = 20 \text{ mm} \)
Fillet radius, \( r = 3.825 \text{ mm} \)
Area, \( A = 5.94 \text{ cm}^2 \)
Moment of inertia about the major axis, \( I_{zz} = 135 \text{ cm}^3 \)
Moment of inertia about the minor axis, \( I_{yy} = 27.5 \text{ cm}^3 \)
Section modulus about the major axis, \( Z_{xx} = 21.6 \text{ cm}^3 \)
Section modulus about the minor axis, \( Z_{yy} = 6.3 \text{ cm}^3 \)
Torsion constant, \( J = 0.125 \text{ cm}^4 \)
Warping constant, \( C_w = 834 \text{ cm}^6 \)
Number of corners, \( N_c = 4 \)
Area of corner, \( A_c = 74 \text{ mm}^2 \)

Verification

Section Dimension Checks

Check flat width ratio per Cl. 5.2.3:

\[ w = b \cdot 2 \times (r + t) = 4.5 \cdot 2 \times (0.3825 + 0.255) = 3.225 \text{ cm} \]
\[ \frac{w}{t} = \frac{3.225}{0.255} = 12.65 < 60 \]

Hence, OK.

Check web height to thickness ratio per Cl. 5.2.4:

\[ h = D - 2(t + r) = 125 - 2 \times (2.55 + 3.825) = 112.3 \text{ mm} \]
\[ \frac{h}{t} = \frac{112.3}{0.255} = 44.02 < 150 \]

Hence, OK.

Check slenderness ratio limits per Cl. 6.3.3:
Radius of gyration, about major axis $r_x = \sqrt{\frac{I_{zz}}{A}} = \sqrt{\frac{135}{5.94}} = 4.77 \text{ cm}$

$$KL/r_x = \frac{1.0(200)}{4.77} = 41.95$$

Radius of gyration, about minor axis $r_y = \sqrt{\frac{I_{yy}}{A}} = \sqrt{\frac{27.5}{5.94}} = 2.15 \text{ cm}$

$$KL/r_y = \frac{1.0(200)}{2.15} = 92.95 < 200$$

Hence, OK.

**Compressive Stress** Actual stress in compression

$$f_c = \frac{P}{A} = \frac{25 \times 10^3}{5.94 \times 10^2} = 42.1 \text{ MPa} = 429 \text{ kgf/cm}^2$$

Calculate the factor, $Q$, per Cl. 6.6.1.1(a):

$$F_c = 0.6 \times F_y = 0.6 \times 350 = 210 \text{ MPa} = 2,141 \text{ kgf/cm}^2$$

$$\frac{w}{t} = 12.65 < \frac{1.435}{\sqrt{F_c}} = \frac{1.435}{\sqrt{2,141}} = 31.0$$

Therefore, $b_{eff} = w = 3.225 \text{ cm}$ and $A_{lost,f} = (w - b_{eff}) \times t = 0 \text{ cm}^2$

Compression stress:

$$Q_s = \frac{F_c}{0.6 \times F_y} = 1.0$$

$$\frac{h}{t} = 44.02 > \frac{1.435}{\sqrt{F_c}} = 31.0$$

Calculate the effective depth of the section by re-arranging the flange ratio:

$$h_{eff} = t \times \frac{2,120}{\sqrt{F_c}} \left[1 - \frac{465}{(h/t)\sqrt{F_c}}\right] = 0.255 \times \frac{2,120}{\sqrt{2,141}} \left[1 - \frac{465}{44.02 \sqrt{2,141}}\right] = 9.015 \text{ cm}$$ (5.2.1.1)

and $A_{lost,d} = (h - h_{eff}) \times t = (11.23 - 9.015) \times 0.255 = 0.565 \text{ cm}^2$

Therefore the effective area, $A_{eff} = A - A_{lost,f} - A_{lost,d} = 5.94 - 0 - 0.565 = 5.38 \text{ cm}^2$

$$Q_a = \frac{A_{eff}}{A} = \frac{5.38}{5.94} = 0.905$$

$$Q = Q_s \times Q_a = 0.905$$

Allowable compression stress:

$$C_e = \sqrt{\frac{2a^2E}{F_y}} = \sqrt{\frac{2 \times 50^2 \times 203,404}{350}} = 107.1$$

$$\frac{C_e}{\sqrt{Q}} = \frac{106.6}{\sqrt{1.0}} = 107.1 < KL/r = \frac{1.0(200)}{2.15} = 92.95$$

Allowable compression stress for members braced against twisting (Ref Cl. 6.6.1.1):
Maximum allowable compressive stress for flexural torsional buckling (Ref Cl.6.6.1.2). The section is symmetric, so the distance between the geometric and shear center, \( x_0 = 0 \).

\[
F_{a1} = \frac{12}{23} Q F_y - \frac{3(9F_y)^2}{23\pi^2 E} \left( \frac{K L}{r} \right)^2 = \frac{12}{23} \times 0.905 \times 3,569 - \frac{3(0.905 \times 3,569)^2}{23\pi^2 (2,074,000)} (92.95)^2 = 1,111 \text{ kgf/cm}^2 = 108.9 \text{ MPa}
\]

\[
F_{a2} = \frac{0.522}{2.75} Q F_y - \left( Q F_y \right)^2 \left( 2,074,000 \right)^2 \times \pi^2 \times E = 165.3 - \frac{0.905 \times 3,569}{7.87 \times 274.8} = 118.3 \text{ MPa}
\]

Therefore, the allowable compressive stress:

\[
F_c = \min \left\{ F_{a1} = 108.9 \text{ MPa}, F_{a2} = 118.3 \text{ MPa} \right\}
\]

Stress ratio in compression: \( 42.1 / 108.9 = 0.387 \)

**Bending Stress**

Actual bending stress:

\[
f_b = \frac{M}{Z_{xx}} = \frac{2.71 \times 10^3}{21.60} = 125.5 \text{ MPa}
\]

Per Cl. 6.8, the maximum allowable stress on the extreme fiber: \( F_c = 0.6 \times F_y = 210 \text{ MPa} \)

Per Cl. 6.3(b), the allowable bending stress for laterally unbraced beams:

\[
C_b = 1.0
\]

\[
\frac{I_{sc}}{d \times I_{yc}} = \frac{(2.000)(21.60 \times 10^3)}{125(15.14 \times 10^3)} = 4.565
\]

\[
\frac{0.18n^2E \times C_b}{F_y} = \frac{0.18n^2(203,400)(1.0)}{350} = 1.032
\]

\[
\frac{0.9n^2E \times C_b}{F_y} = \frac{0.9n^2(203,400)(1.0)}{350} = 5.162
\]
Since \( \frac{0.18n^2E \times C_b}{F_y} \times \frac{L^2S_{sc}}{d \times I_{yc}} < \frac{0.9n^2E \times C_b}{F_y} \),

\[ F_b = \frac{2}{3} \frac{n^2E \times C_b}{L} \frac{d \times I_{yc}}{2S_{sc}} = 130.1 \text{ MPa} \]

Stress ratio in bending: \( 125.5 / 130.1 = 0.963 \)

Shear Stress

Shear area:

\[ A_z = 2Bt = 2.295 \text{ cm}^2 \]
\[ A_y = t[(D - 2t) + 2(c \cdot t)] = 3.947 \text{ cm}^2 \]

Clear distance between flanges, \( h = d - 2t = 12.5 - 2 \times 0.255 = 11.99 \text{ cm} \)

\[ \frac{h}{t} = \frac{11.99}{0.255} = 47.02 < \frac{4.590}{\sqrt{F_y}} = 99.20 \]

\[ F_v = \min \left| \frac{1.275 \sqrt{F_y}}{h / t} \right| = \frac{1.275 \sqrt{1,627}}{47.02} = 1,627 \text{ kgf/cm}^2 = 159.6 \text{ MPa} \]

Actural shear stress:

\[ f_v = \frac{V_y}{A_z} = \frac{6.85(10)}{3.947} = 17.36 \text{ MPa} \]

Stress ratio in shear: \( 17.36 / 140 = 0.124 \)

Bending in Web Stress

The actual bending stress in the web is calculated by interpolating from the bending stress diagram:

\[ f_{bw} = f_b \left(1 - \frac{t}{0.5h}ight) = 125.5 \left(1 - \frac{0.255}{0.5 \times 12.5}\right) = 120.4 \text{ MPa} \]

The allowable bending stress in the web:

\[ F_{bw} = \frac{36,560,000}{(h / t)^2} = 16,536 \text{ kgf/cm}^2 = 1622 \text{ MPa} > 0.6F_y = 211.9 \text{ MPa} \] \( (6.4.2) \)

Stress ratio in web bending: \( 120.4 / 211.9 = 0.568 \)

Combined Bending and Shear Stress in Web

Per Cl. 6.4.3, use \( F_{bw} = \frac{36,560,000}{(h / t)^2} = 16,536 \text{ kgf/cm}^2 = 1622 \text{ MPa} \) and \( F_v = 159.6 \text{ MPa} \)

Stress ratio in combined web bending and shear:

\[ \sqrt{\left(\frac{f_{bw}}{F_{bw}}\right)^2 + \left(\frac{f_v}{F_v}\right)^2} = \sqrt{\left(\frac{120.3}{1,622}\right)^2 + \left(\frac{17.35}{159.6}\right)^2} = 0.132 \]

- $Sy$ Right: 6.275

**Intermediate Results:** $C_b = 1.000$

---

**NOTE:** Torsion and deflections have not been considered in the design.
where \( w = -20 \text{kN/m} \) and \( L = 4 \text{ m} \)

Equation SSB-1.10 of JSME is used to evaluate Young's modulus, \( E \), for equation 5.8 (YNG 1).

\[
d = 400 \text{ mm}, \quad b_f = 200 \text{ mm}, \quad t_w = 12 \text{ mm}, \quad t_f = 22 \text{ mm}
\]

**Verification**

Maximum Moment, \( MZ1 = 43.714 \text{kN\cdot m} \)

Minimum Moment, \( MZ2 = 43.714 \text{kN\cdot m} \)

Span Moment = 46.286 kN\cdot m

Unbraced length of compression flange, \( l_b = 6,000 \text{ mm} \)

**Note:** Only the flanges will be considered (i.e., the web is ignored for calculating the section modulus). (MBG 1)

Area of compression flange = \( A_f = b_f \times t_f = 4,400 \text{ mm}^2 \)

\[
C_g = \frac{b_f \times t_f \times \left( d - \frac{t_f}{2} \right) + b_f \times t_f \times \frac{t_f}{2}}{b_f \times t_f + b_f \times t_f} = 200 \text{ mm}
\]

\[
I_{zz} = 2 \times \left( b_f \times \frac{t_f^3}{12} \right) + 2 \times b_f \times t_f \times \left( c_g \times \frac{t_f}{2} \right)^2 = 3.147 \times (10)^8 \text{ mm}^4
\]

Elastic Section Modulus about Z axis on compression side \( Z_{zc} = I_{zz}/c_g = 1.573 \times 10^6 \text{ mm}^3 \)

\[
I_{yc} = t_f \times b_f^3/12 = 1.467 \times 107 \text{ mm}^4
\]

\[
A_C = t_r \times b_f = 4,400 \text{ mm}^2
\]

\[
r_1 = \sqrt{I_{yc}/A_C} = 57.735 \text{ mm}
\]
Bending Moment Factor \( C = 1.75 - 1.05 \times (-MZ_2/MZ_1) + 0.3 \times (-MZ_2/MZ_1)^2 = 3.198 \), but not more than 2.3
As Span moment > MZ1, C will be 1

Allowable slenderness ratio \( \Lambda = \pi^2 \times \frac{E}{0.6 \times F_{YLD}} = 119.789 \)

\[
f_{b1} = 1.5 \times \left[ 1 - 0.4 \times \frac{(l_b)^2}{C \times \Lambda^2} \right] \times \frac{f_t}{\gamma} = 109.501 \text{ N/mm}^2
\]

As per Eq. SSB-1.10 for \( \gamma_{NG} = 1 \):

\[
f_{b2} = 1.5 \times \frac{0.433 \times E}{(l_b \times d)^2} = 162.736 \text{ N/mm}^2
\]

\( f_{bz1} = \max(f_{b1}, f_{b2}) = 162.736 \text{ N/mm}^2 \)

Allowable tensile bending stress, \( f_{bzt} = f_t = 156.67 \text{ N/mm}^2 \)

Actual tensile bending stress about Z axis = \( 46.286/Z_{ZC} = 29.43 \text{ N/mm}^2 \)

Utilization ratio = Actual bending stress/Allowable bending stress = \( 29.43/156.67 = 0.188 \)

Allowable compressive bending stress, \( f_{bzc} = \min(f_{bz1}, f_t) = 156.67 \text{ N/mm}^2 \)

Actual compressive bending stress about Z axis = \( 46.286/Z_{ZC} = 29.43 \text{ N/mm}^2 \)

Utilization ratio = Actual bending stress/Allowable bending stress = \( 29.43/156.67 = 0.188 \)

**INTERMEDIATE RESULTS (Bending)**  

C: 1.000

**INTERMEDIATE RESULTS (Von-Mises)**
V.AIJ 2002 Check for MISES parameter

Verify the von Mises stress calculations per the AIJ 2002 code using a cantilever beam.

Details

Japanese Angle section L250X250X35, $E = 205,000$ MPa, $F_y = 200$ MPa

The member is a 5 m cantilever with the following applied loads at the end:

- $F_x = 10$ kN
- $V_z = 5$ kN
- $V_y = 5$ kN
- $T = 5$ kN·m

Verification

The maximum of the left-hand side of the von Mises stress equation apparently occurs at the fixed support of the beam. Section forces at the fixed end are calculated as below.

- $FX = -10$ KN
- $FY = -5$ KN
- $FZ = -5$ KN
- $MX = -5$ KN·m
- $MY = 25$ KN·m
- $MZ = -25$ KN·m

The standard AIJ calculation is used (MISES 1). From these section forces, $\sigma_x$ and $\tau_{xy}$ at the section of the fixed end are calculated:

\[
\sigma_x = \frac{|F_x|}{A_x} + \frac{|M_y|}{Z_y} + \frac{|M_z|}{Z_z}
\]
\[
= \frac{-10,000}{16,260} + \frac{25,000,000}{838,660} + \frac{-25,000,000}{335,900}
\]
\[
= 0.615 + 29.809 + 70.244 = 100.668 \text{ N/mm}^2
\]

\[
\tau_{xy} = \frac{|M_x|}{Z_x} + \sqrt{\left(\frac{F_y}{A_y}\right)^2 + \left(\frac{F_z}{A_z}\right)^2}
\]
\[
= \frac{5,000,000}{189,700} + \sqrt{\left(\frac{5,000}{5,833}\right)^2 + \left(\frac{5,000}{5,833}\right)^2}
\]
\[
= 27.57 \text{ N/mm}^2
\]

From $\sigma_x$ and $\tau_{xy}$, $f_m$ is calculated:
\[ f_m = \sqrt{\sigma_x^2 + 3\tau_{xy}^2} = 111.42 \text{ N/mm}^2 \]

For permanent loading, \( k = 1 \) and \( f_t = f_y / 1.5 = 133.33 \text{ N/mm}^2 \)

Therefore, the ratio \( = f_m / k \times f_t = 111.419 / (1 \times 133.33) = 0.836 \)

**V.AIJ 2005 Check for MBG parameter**

Verify the effect of the MBG parameter of the AIJ 2005 code on a doubly symmetric I shaped beam of span 6m, that is subjected to UDL of -20 KN/m on its span.

**Details**

Japanese H Shape Doubly Symmetric I Section H400X200X12X22 used in the following frame, $E = 205,000$ MPa, $F_y = 235$ MPa
where \( w = -20 \text{kN/m} \) and \( L = 4 \text{ m} \)

Equation SSB-1.10 of JSME is used to evaluate Young's modulus, \( E \), for equation 5.8 (YNG 1).

\[ d = 400 \text{ mm}, b_f = 200 \text{ mm}, t_w = 12 \text{ mm}, t_f = 22 \text{ mm} \]

**Verification**

Maximum Moment, \( MZ1 = 43.714 \text{kN m} \)

Minimum Moment, \( MZ2 = 43.714 \text{kN m} \)

Span Moment = 46.286 kN m

Unbraced length of compression flange, \( l_b = 6,000 \text{ mm} \)

**Note:** Only the flanges will be considered (i.e., the web is ignored for calculating the section modulus). (MBG 1)

Area of compression flange = \( A_f = b_f \times t_f = 4,400 \text{ mm}^2 \)

\[
C_g = \frac{b_f \times t_f \left( \frac{d}{2} + b_f \times t_f \right)}{b_f \times t_f + (b_f \times t_f)} = 200 \text{ mm}
\]

\[
I_{zz} = 2 \times \left( b_f \times \frac{t_f^3}{12} \right) + 2 \times b_f \times t_f \times \left( c_g \times \frac{t_f}{2} \right)^2 = 3.147 \times (10)^8 \text{ mm}^4
\]

Elastic Section Modulus about Z axis on compression side \( Z_{zc} = I_{zz}/c_g = 1.573 \times 10^6 \text{ mm}^3 \)

\[
I_{yc} = t_f \times b_f^2 / 12 = 1.467 \times 10^7 \text{ mm}^4
\]

\[ A_C = t_f \times b_f = 4,400 \text{ mm}^2 \]

\[ r_1 = \sqrt{I_{yc}/A_C} = 57.735 \text{ mm} \]
Bending Moment Factor \( C = 1.75 - 1.05 \times \left(-\frac{MZ_2}{MZ_1}\right) + 0.3 \times \left(-\frac{MZ_2}{MZ_1}\right)^2 \) = 3.198, but not more than 2.3

As Span moment > MZ1, C will be 1. (Eq. 5.15)

Elastic critical slenderness ratio \( \frac{\varepsilon \lambda_b}{\lambda_b} = \frac{1}{\sqrt{0.6}} = 1.291 \) (Eq. 5.11)

Plastic slenderness ratio \( =\frac{p \lambda_b}{\lambda_b} = 0.3 \) (Eq. 5.14)

\[ M_y = f_y \times Z_Z = 427.7 \text{ kN} \cdot \text{m} \]

(Eq. 5.16)

So, \( \lambda_b = \sqrt{\frac{M_y}{M_e}} = 0.8753 \) (Eq. 5.10)

So, \( p \lambda_b < \lambda_b < \varepsilon \lambda_b \)

So, we calculate Allowable bending stress as per Eq. 5.8

\[ v = \frac{3}{2} + \frac{2}{3} \times \left(\frac{\lambda_b}{\varepsilon \lambda_b}\right)^2 = 1.8065 \]

\[ f_b = \frac{1 \cdot 0.4 \times \frac{\lambda_b}{\varepsilon \lambda_b} \times \frac{p \lambda_b}{\lambda_b}}{v} \times f_y \]

= 99.88 N/mm²

Allowable tensile bending stress, \( f_{bzt} = f_t = 156.667 \text{ N/mm}^2 \)

Actual tensile bending stress about Z axis = 46.286/ZZC = 29.425 N/mm²

Utilization ratio = Actual bending stress/Allowable bending stress = 29.425/156.667 = 0.1878

Allowable compressive bending stress \( f_{bzc} = \min(f_b, f_t) = 99.88 \text{ N/mm}^2 \)

Actual compressive bending stress about Z axis = 46.286/ZZC = 29.425 N/mm²

Utilization ratio = Actual bending stress/Allowable bending stress = 29.425/99.88 = 0.295

V.AIJ 2005 Check for MISES parameter

Verify the Von Mises stresses per the AIJ 2005 code of a beam in a frame.

Details

A cantilever beam is subject to the following forces at the free end. The cantilever member is a pair of C12X30, back-to-back.

\[
\begin{align*}
F_x &= 5 \text{ kN} \\
F_y &= -15 \text{ kN} \\
F_z &= 5 \text{ kN} \\
M_x &= 10 \text{ kN m} \\
M_y &= -6.667 \text{ kN m}
\end{align*}
\]

The member is steel with the following material properties:

\[
E = 205,000 \text{ MPa} \\
F_y = 200 \text{ MPa}
\]

The section forces at the fixed-end of the left cantilever are taken from the STAAD.Pro analysis:

\[
\begin{align*}
F_x &= -5 \text{ kN} \\
F_y &= -15 \text{ kN} \\
F_z &= -5 \text{ kN} \\
M_x &= 10 \text{ kN m} \\
M_y &= 15 \text{ kN m} \\
M_z &= 25 \text{ kN m}
\end{align*}
\]
Validation

From the section forces, $\sigma_x$ and $\tau_{xy}$ at the cross-section at the fixed end are calculated:

$$\sigma_x = \left| \frac{F_x}{A_x} \right| + \left| \frac{M_y}{Z_y} \right| + \left| \frac{M_z}{Z_z} \right| = \left| \frac{-5,000}{11,368} \right| + \left| \frac{1,500,000}{425,030} \right| + \left| \frac{25,000,000}{884,900} \right| = 0.440 + 35.292 + 28.25 = 63.98 \text{ N/mm}^2$$

$$\tau_{xy} = \left| \frac{M_x}{Z_x} \right| + \sqrt{\left( \frac{F_y}{A_y} \right)^2 + \left( \frac{F_z}{A_z} \right)^2} = \left| \frac{10,000,000}{51,605} \right| + \sqrt{\left( \frac{15,000}{7,897} \right)^2 + \left( \frac{5,000}{2,732} \right)^2} = 196.4 \text{ N/mm}^2$$

From these, the Von Mises stress, $f_m$, is calculated as:

$$f_m = \sqrt{\sigma_x^2 + 3\tau_{xy}^2} = \sqrt{(63.98)^2 + 3(196.5)^2} = 346.17 \text{ N/mm}^2$$

For permanent loading conditions, $k = 1$ and $f_t = F_y/1.5 = 133.3 \text{ N/mm}^2$

The ratio $f_m / (k \times f_t) = 346.17 / (1 \times 133.3) = 2.596$

V.AIJ 2005 Check for MISES parameter 2

A slender, cantilever beam subjected to a load at the end.

Given

A cantilever beam of length 0.3 meters is subjected to a permanent joint load of 3 kN in the Y direction and 2 kN in the Z direction as well as a 0.008 kN·m torque applied at the end. Axial tension of 10 kN is also applied to the member. An H100x50x5 section is used from the Japanese steel tables.

Section properties

\[ D = 100 \text{ mm}, \ B = 50 \text{ mm}, \ t_f = 7 \text{ mm}, \ t_w = 5 \text{ mm} \]
\[ I_x = 15,000 \text{ mm}^4 \]
\[ A_x = 1185 \text{ mm}^2, \ A_y = 500 \text{ mm}^2, \ A_z = 467 \text{ mm}^2 \]
\[ Z_x = I_x/t_{max} = 15,000/7 = 2,143 \text{ mm}^3, Z_y = 5,920 \text{ mm}^3, Z_z = 37,400 \text{ mm}^3 \]

The maximum of the left hand side of the von Mises stress equation apparently occurs at the fixed end of the beam. Section forces at the fixed end are as follows:

-10.0 kN (Tension)
0.6 kN·m (Bending-Y)
0.9 kN·m (Bending-Z)
-3.0 kN (Shear-Y)
Material
FYLD = 300 MPa
E = 2.05E+05 MPa
G = E/2.6 MPa

Solution
From these section forces, $\sigma_x$ and $\tau_{xy}$ at the section of the fixed end are calculated as follows:

$$\sigma_x = \left| \frac{F_x}{A_x} \right| + \left| \frac{M_y}{Z_y} \right| + \left| \frac{M_z}{Z_z} \right|$$

$$\tau_{xy} = \left| \frac{M_x}{Z_x} \right| + \sqrt{\left( \frac{F_y}{A_y} \right)^2 + \left( \frac{F_z}{A_z} \right)^2}$$

$$\sigma_x = \left| -\frac{10,000}{1,185} \right| + \left| \frac{600,000}{5,920} \right| + \left| \frac{-900,000}{37,400} \right| = 8.44 + 101.35 + 24.06 = 133.85 \text{ N/mm}^2$$

$$\tau_{xy} = \left| -\frac{8,000}{2,143} \right| + \sqrt{\left( \frac{-5,000}{500} \right)^2 + \left( \frac{-2,000}{467} \right)^2} = 3.73 + \sqrt{6^2 + 4.28^2} = 11.10 \text{ N/mm}^2$$

From $\sigma_x$ and $\tau_{xy}$, $f_m$ is calculated:

$$f_m = \sqrt{\sigma_x^2 + 3\tau_{xy}^2} = \sqrt{(133.85)^2 + 3(11.10)^2} = 135.22 \text{ N/mm}^2$$

Since $f_t = FYLD/1.5 = 300.0 \text{ MPa}/1.5 = 200.0 \text{ N/mm}^2$ and $k = 1$ for permanent loading,

$$\text{Ratio} = \frac{135.22}{(200.0 \cdot 1)} = 0.676 < 1, \text{ So OK.}$$

#### V.09 Steel Design

**Related Links**
- [D9.B.4 Von Mises Stresses Check](on page 1718)

#### V.AIj 2005 UPT Channel

Verify the bending capacity and compression capacity of a channel section beam.

**Details**

The member is a 5 m long simply-supported beam. The section used is a C380X100X10.5. The steel has a yield strength of 235 MPa, a modulus of elasticity of 205x(10)^3 MPa, and a shear modulus of 79x(10)^3 MPa.

The member is subject to the following loads:

- a 10 kN·m concentrated moment at the left end
- a -3 kN·m concentrated moment at the right end
Validation

Section Properties

- Depth, \( D = 380 \text{ mm} \)
- Width, \( B = 100 \text{ mm} \)
- Thickness of web, \( t_w = 10.5 \text{ mm} \)
- Thickness of flange, \( tf = 16 \text{ mm} \)

Height of web, \( d = D - 2t_f = 348 \text{ mm} \)

Area, \( A_x = 2B \times t_f + d \times t_w = 6,854 \text{ mm}^2 \)

Distance from heel to centroid, \( c_z = \frac{t_f B^2 + \frac{1}{2} t_w d}{A} = \frac{16(100)^2 + \frac{1}{2}(10.5)^2(348)}{6,854} = 26.14 \text{ mm} \)

Moment of inertia about major axis, \( I_z = \frac{d^3 t_w}{12} + 2\left[ t_w d \left( c_z - \frac{t_w}{2} \right)^2 + 2 \left( \frac{t_f B^3}{12} + t_f B \left( \frac{B}{2} \cdot c_z \right)^2 \right) \right] = 142.9(10)^6 \text{ mm}^4 \)

Moment of inertia about minor axis, \( I_y = \frac{t_w^3 d}{12} + t_w d \left( c_z - \frac{t_w}{2} \right)^2 + 2 \left[ \frac{t_f B^3}{12} + t_f B \left( \frac{B}{2} \cdot c_z \right)^2 \right] = 6.117(10)^6 \text{ mm}^4 \)

Major axis section modulus, \( Z_z = \frac{I_z}{D^2} = 752.3(10)^3 \text{ mm}^3 \)

Minor axis section modulus, \( Z_y = \frac{I_y}{B \cdot c_z} = 82.82(10)^3 \text{ mm}^3 \)

Torsional constant, \( J = \frac{1}{3} \left( d t_w^3 + 2B t_f^3 \right) = 407.4(10)^3 \text{ mm}^4 \)

Warping constant, \( C_W = 144.3(10)^9 \text{ mm}^6 \)

Radius of gyration about major axis, \( r_z = \sqrt{\frac{I_z}{A}} = 144.4 \text{ mm} \)

Radius of gyration about minor axis, \( r_y = \sqrt{\frac{I_y}{A}} = 29.87 \text{ mm} \)

Section Classification

For webs of beams (Cl. 8.5):
\[
\frac{d}{t_w} = 33.14 < 2.4 \sqrt{\frac{E}{F}} = 2.4 \sqrt{\frac{205,000}{235}} = 70.89
\]

Depth to thickness ratio is "OK".

Allowable Compressive Stress

The slenderness ratio of compression members (Cl. 11.1):
\[
\lambda = \frac{K_y \times L_y}{r_y} = \frac{1 \times 5,000}{29.87} = 167.4
\]

Slenderness ratio dividing elastic and inelastic buckling (Cl no 5.5):
\[ \Lambda = \sqrt{\frac{\pi^2 \times E}{0.6 \times F}} = \sqrt{\frac{\pi^2 \times 205,000}{0.6 \times 235}} = 119.8 \]

\[ \nu = \frac{3}{2} + \frac{2}{3} \left( \frac{\lambda}{\Lambda} \right)^2 = \frac{3}{2} + \frac{2}{3} \left( \frac{167.4}{119.8} \right)^2 = 2.802 \]

\[ \lambda > \Lambda \text{, so the allowable compressive stress is given by Cl. 5.4:} \]

\[ f_c = \frac{0.277 \times F}{\left( \frac{\lambda}{\Lambda} \right)^2} = \frac{0.277 \times 235}{\left( \frac{167.4}{119.8} \right)^2} = 33.35 \text{ MPa} \]

**Allowable Flexural Stress**

Distance between braced points of the compression flange, \( l_b = 5,000 \text{ mm} \).

The yield moment,

\[ M_y = F \times Z_z = \frac{235 \times 752.3 (10)^3}{10^6} = 176.8 \text{ kN} \cdot \text{m} \]

The modification factor for allowable flexural stress (Cl. 5.13):

\[ C = 1.75 \times 1.05 \times \left( \frac{M_2}{M_1} \right) + 0.3 \times \left( \frac{M_2}{M_1} \right)^2 = 1.75 \times 1.05 \times \left( \frac{3}{10} \right) + 0.3 \times \left( \frac{3}{10} \right)^2 = 1.462 \]

The elastic lateral-torsional buckling moment (Cl 5.12):

\[ M_e = C \times \frac{n^4 \times E \times I_y \times E \times I_w}{l_b^4} + \frac{n^2 \times E \times I_y \times G \times J}{l_b^2} \]

\[ \frac{n^4 \times E \times I_y \times E \times I_w}{l_b^4} = \frac{n^4 \times 205,000 \times 6.117 \times 10^6 \times 205,000 \times 144.3 \times 10^9}{5,000^4} = 5.791 \times 10^{15} \]

\[ \frac{n^2 \times E \times I_y \times G \times J}{l_b^2} = \frac{n^2 \times 205,000 \times 6.117 \times 10^6 \times 79,000 \times 407.4 \times 10^3}{5,000^2} = 15.93 \times 10^{15} \]

\[ = 1.462 \times \sqrt{5.791 \times 10^{15} + 15.93 \times 10^{15}} = 215.4 \text{ kN} \cdot \text{m} \]

The maximum slenderness ratio to achieve the plastic strength (Cl. 5.12):

\[ p\lambda_b = 0.6 + 0.3 \times \left( \frac{M_2}{M_1} \right) = 0.6 + 0.3 \times \left( \frac{3}{10} \right) = 0.51 \]

The elastic slenderness limit:

\[ e\lambda_b = \frac{1}{\sqrt{0.6}} = 1.291 \]

Slenderness ratio of the flexural member,

\[ \lambda_b = \sqrt{\frac{M_y}{M_e}} = 0.906 \]

Here, \( p\lambda_b < \lambda_b \leq e\lambda_b \), so:

\[ \nu = \frac{3}{2} + \frac{2}{3} \times \left( \frac{\lambda_b}{e\lambda_b} \right)^2 = \frac{3}{2} + \frac{2}{3} \times \left( \frac{0.906}{1.291} \right)^2 = 1.828 \]

\[ f_b = \frac{1 \times 0.4 \times \frac{\lambda_b \times p\lambda_b}{e\lambda_b \times p\lambda_b}}{\nu} \times F = \frac{1 \times 0.4 \times \frac{0.906 \times 0.3}{1.291 \times 0.3}}{1.828} \times 235 = 102.5 \text{ MPa} \]

- [D9.B.2 Member Capacities](on page 1711)

V. AlJ 2005 UPT Double Angle

Verify the bending capacity and compression capacity of a double angle section beam.

Details

The member is a 5 m long simply-supported beam. The section used is a 2x L100x100x13, with no spacing. The steel has a yield strength of 235 MPa, a modulus of elasticity of $205 \times (10)^3$ MPa, and a shear modulus of $79 \times (10)^3$ MPa.

The member is subject to the following loads:

- a -5 kN concentrated force at mid-span in the global Y direction
- a 3 kN concentrated force at mid-span in the global Z direction
- a -40 kN axial force
- a -0.2 kN·m concentrated moment at the left end

Validation

Section Properties

Dimensions:

- Leg, \( D = 100 \) mm
- Width, \( B = 200 \) mm
- Thickness, \( t = 13 \) mm

Outstanding leg length, \( d = D - t = 87 \) mm

Area, \( A_x = B \times t + 2d \times t = 4,862 \) mm$^2$

Distance from heel to centroid, \( c_y = \frac{\frac{1}{2}Bt^2 + 2dt\left(t + \frac{d}{2}\right)}{A} = \frac{\frac{1}{2}200(13)^2 + 2(87)\left(13 + \frac{87}{2}\right)}{4,862} = 29.76 \) mm

Moment of inertia about major axis, \( I_z = \frac{Bt^3}{12} + Bt\left(c_y - \frac{t}{2}\right) + 2\left[td^3\frac{3}{12} + td\left(t + \frac{d}{2} - c_y\right)^2\right] = 4,487(10)^6 \) mm$^4$

Moment of inertia about minor axis, \( I_y = \frac{tB^3}{12} + \frac{2}{3}dt^3 = 8,676(10)^6 \) mm$^4$
Major axis section modulus, \( Z_z = \frac{I_z}{D - c_y} = 63.81 \times 10^3 \) mm\(^3\)

Minor axis section modulus, \( Z_y = \frac{I_y}{D} = 86.76 \times 10^3 \) mm\(^3\)

Torsional constant, \( J = 273.9 \times 10^3 \) mm\(^4\)

Warping constant, \( C_W = 199.5 \times 10^9 \) mm\(^6\)

Radius of gyration about major axis, \( r_z = \sqrt{\frac{I_z}{A}} = 30.38 \) mm

Radius of gyration about minor axis, \( r_y = \sqrt{\frac{I_y}{A}} = 42.53 \) mm

Section Classification

For webs of beams (Cl. 8.1):
\[
\frac{d}{t_w} = 7.69 < 0.44\sqrt{\frac{E}{F}} = 0.44\sqrt{\frac{205,000}{235}} = 13.0
\]

Depth to thickness ratio is “OK”.

Allowable Compressive Stress

The slenderness ratio of compression members (Cl. 11.1):
\[
\lambda_z = \frac{K_z \times L_z}{r_z} = \frac{1 \times 5,000}{30.38} = 164.6
\]
\[
\lambda_y = \frac{K_y \times L_y}{r_y} = \frac{1 \times 5,000}{42.53} = 117.6
\]

Therefore, \( \lambda = 164.6 \).

Slenderness ratio dividing elastic and inelastic buckling (Cl no 5.5):
\[
\Lambda = \sqrt{\frac{n^2 \times E}{0.6 \times F}} = \sqrt{\frac{1^2 \times 205,000}{0.6 \times 235}} = 119.8
\]

\[
\nu = \frac{3}{2} + \frac{2}{3} \times (\frac{\lambda}{\Lambda})^2 = \frac{3}{2} + \frac{2}{3} \times (\frac{164.6}{119.8})^2 = 2.758
\]

\( \lambda > \Lambda \), so the allowable compressive stress is given by Cl. 5.4:
\[
f_c = \frac{0.277}{\left(\frac{\Lambda}{\nu}\right)^2} = \frac{0.277 \times 235}{\left(\frac{164.6}{119.8}\right)^2} = 34.49 \text{ MPa}
\]

Allowable Flexural Stress

Distance between braced points of the compression flange, \( l_b = 5,000 \) mm.

The yield moment, \( M_y = F \times Z_z = \frac{235 \times 87.94(10)^3}{10^6} = 20.67 \) kN m

The modification factor for allowable flexural stress (Cl. 5.13):
\[
C = 1
\]

The elastic lateral-torsional buckling moment (Cl. 5.12):
\[ M_e = C \times \left( \frac{n^4 \times E \times I_{zz} \times E \times I_w}{I_b^4} + \frac{n^2 \times E \times I_{zz} \times G \times J}{I_b^2} \right) \]

\[ \frac{n^4 \times E \times I_{zz} \times E \times I_w}{I_b^4} = \frac{n^4 \times 205,000 \times 4.847 \times 10^6}{5,000^4} = 6.333 \times 10^{12} \]

\[ \frac{n^2 \times E \times I_{zz} \times G \times J}{I_b^2} = \frac{n^2 \times 205,000 \times 4.847 \times 10^6 \times 79,000 \times 273.9 \times 10^3}{5,000^2} = 8.488 \times 10^{15} \]

\[ = 1.0 \times 6.333 \times 10^{12} + 8.488 \times 10^{15} = 88.59 \text{kN m} \]

The maximum slenderness ratio to achieve the plastic strength (Cl. 5.12):

\[ p\lambda_b = 0.3 \]

The elastic slenderness limit:

\[ e\lambda_b = \frac{1}{\sqrt{0.6}} = 1.291 \]

Slenderness ratio of the flexural member, \( \lambda_b = \sqrt{\frac{M_y}{M_e}} = 0.483 \)

Here, \( p\lambda_b < \lambda_b \leq e\lambda_b \), so:

\[ v = \frac{3}{2} + \frac{2}{3} \times \left( \frac{\lambda_b}{e\lambda_b} \right)^2 = \frac{3}{2} + \frac{2}{3} \times \left( \frac{0.483}{1.291} \right)^2 = 1.593 \]

\[ f_b = \left( 1 - 0.4 \times \frac{\lambda_b \cdot p\lambda_b}{v} \right) \times F = \left( 1 - 0.4 \times \frac{0.483 \cdot 0.3}{1.593} \right) \times 235 = 136.6 \text{MPa} \]

**V.AIJ 2005 UPT General**

Verify the bending capacity and compression capacity of an H section beam.

**Details**

The member is a 5 m long simply-supported beam. The section used is an H300x150x6.5x9. The steel has a yield strength of 235 MPa, a modulus of elasticity of \(205 \times (10)^3\) MPa, and a shear modulus of \(79 \times (10)^3\) MPa.

The member is subject to the following loads:

- a -10 kN concentrated force at mid-span in the global Y direction
- a 3 kN concentrated force at mid-span in the global Z direction
- a -40 kN axial force
- a -0.2 kN-m concentrated moment at the left end
Validation

Section Properties

Dimensions:

Leg, \( D = 300 \text{ mm} \)
Width, \( B = 150 \text{ mm} \)
Thickness of web, \( t_w = 6.5 \text{ mm} \)
Thickness of flange, \( t_f = 9 \text{ mm} \)

Depth of web, \( d = D - 2t_f = 282 \text{ mm} \)
Area, \( A_x = 4,678 \text{ mm}^2 \)

Moment of inertia about major axis, \( I_z = 72.1(10)^6 \text{ mm}^4 \)
Moment of inertia about minor axis, \( I_y = 0.508(10)^6 \text{ mm}^4 \)

Major axis section modulus, \( Z_z = 480.7(10)^3 \text{ mm}^3 \)
Minor axis section modulus, \( Z_y = 67.73(10)^3 \text{ mm}^3 \)

Torsional constant, \( J = 99.5(10)^3 \text{ mm}^4 \)
Warping constant, \( C_W = 107.5(10)^9 \text{ mm}^6 \)

Radius of gyration about major axis, \( r_z = \sqrt{\frac{I_z}{A_x}} = 124.1 \text{ mm} \)
Radius of gyration about minor axis, \( r_y = \sqrt{\frac{I_y}{A_x}} = 32.95 \text{ mm} \)

Section Classification

For webs of beams in compression (Cl. 8.1):
\[
\frac{d}{t_w} = \frac{282}{6.5} = 43.39 < 1.6 \sqrt{\frac{E}{F}} = 1.6 \sqrt{\frac{205,000}{235}} = 47.26
\]
Depth to thickness ratio is “OK”.

For webs of beams in bending (Cl. 8.1):
\[
\frac{d}{t_w} = 43.39 < 2.4 \sqrt{\frac{E}{F}} = 2.4 \sqrt{\frac{205,000}{235}} = 70.89
\]
Depth to thickness ratio is “OK”.

Allowable Compressive Stress

The slenderness ratio of compression members (Cl. 11.1):
\[
\lambda_z = \frac{K_z \times L_z}{r_z} = \frac{1 \times 5,000}{124.1} = 40.27
\]
\[
\lambda_y = \frac{K_y \times L_y}{r_y} = \frac{1 \times 5,000}{32.95} = 151.7
\]

Therefore, \( \lambda = 151.7 \).
Slenderness ratio dividing elastic and inelastic buckling (Cl no 5.5):

\[ \Lambda = \sqrt{\frac{n^2 \times E}{0.6 \times F}} = \sqrt{\frac{n^2 \times 205,000}{0.6 \times 235}} = 119.8 \]

\[ \nu = \frac{3}{2} + \frac{2}{3} \times \left( \frac{\lambda}{\Lambda} \right)^2 = \frac{3}{2} + \frac{2}{3} \times \left( \frac{151.7}{119.8} \right)^2 = 2.570 \]

\( \lambda > \Lambda \), so the allowable compressive stress is given by Cl. 5.4:

\[ f_c = 0.277 \times F \left( \frac{\lambda}{\Lambda} \right)^2 = 0.277 \times 235 \left( \frac{151.7}{119.8} \right)^2 = 40.57 \text{ MPa} \]

**Allowable Flexural Stress**

Distance between braced points of the compression flange, \( l_b = 5,000 \text{ mm} \).

The yield moment,

\[ M_y = F \times Z_z = \frac{235 \times 480.7(10)^2}{10^6} = 113.0 \text{ kN m} \]

The modification factor for allowable flexural stress (Cl. 5.13):

\[ C = 1 \]

The elastic lateral-torsional buckling moment (Cl 5.12):

\[ M_e = C \left( \frac{n^4 \times E \times I_y \times E \times I_w}{l_b^4} + \frac{n^2 \times E \times I_y \times G \times J}{l_b^2} \right) \]

\[ \frac{n^4 \times E \times I_y \times E \times I_w}{l_b^4} = \frac{n^4 \times 205,000 \times 50.8 \times 10^6 \times 205,000 \times 107.5 \times 10^9}{5,000^4} = 35.77 \times 10^{15} \]

\[ \frac{n^2 \times E \times I_y \times G \times J}{l_b^2} = \frac{n^2 \times 205,000 \times 50.8 \times 10^6 \times 79,000 \times 99.54 \times 10^3}{5,000^2} = 32.32 \times 10^{15} \]

\[ = 1.0 \times \sqrt{35.77 \times 10^{15} + 32.32 \times 10^{15}} = 82.49 \text{ kN m} \]

The maximum slenderness ratio to achieve the plastic strength (Cl. 5.12):

\[ p\lambda_b = 0.3 \]

The elastic slenderness limit:

\[ e\lambda_b = \frac{1}{\sqrt{0.6}} = 1.291 \]

Slenderness ratio of the flexural member, \( \lambda_b = \sqrt{\frac{M_y}{M_e}} = 1.17 \)

Here, \( p\lambda_b < \lambda_b \leq e\lambda_b \), so:

\[ \nu = \frac{3}{2} + \frac{2}{3} \times \left( \frac{\lambda_b}{e\lambda_b} \right)^2 = \frac{3}{2} + \frac{2}{3} \times \left( \frac{1.17}{1.291} \right)^2 = 2.048 \]

\[ f_b = \frac{\left( 1 - 0.4 \times \frac{\lambda_b \cdot p\lambda_b}{e\lambda_b \cdot p\lambda_b} \right) \times F}{\nu} = \frac{\left( 1 - 0.4 \times \frac{1.17 \cdot 0.3}{1.291 \cdot 0.3} \right) \times 235}{2.048} = 74.45 \text{ MPa} \]

- [D9.B.2 Member Capacities](on page 1711)

V.AIJ 2005 UPT I

Verify the bending capacity and compression capacity of an I section beam.

Details

The member is a 5 m long simply-supported beam. The section used is an I300X150X8. The steel has a yield strength of 235 MPa, a modulus of elasticity of $205 \times (10)^3$ MPa, and a shear modulus of $79 \times (10)^3$ MPa.

The member is subject to the following loads:

- a -10 kN concentrated force at mid-span in the global Y direction
- a 3 kN concentrated force at mid-span in the global Z direction
- a -40 kN axial force
- a -0.2 kN·m concentrated moment at the left end

Validation

Section Properties

Dimensions:

- Leg, $D = 300 \text{ mm}$
- Width, $B = 150 \text{ mm}$
- Thickness of web, $t_w = 8 \text{ mm}$
- Thickness of flange, $t_f = 13 \text{ mm}$

Depth of web, $d = D - 2t_f = 274 \text{ mm}$

Area, $A_x = 6,092 \text{ mm}^2$

Moment of inertia about major axis, $I_z = 94.08(10)^6 \text{ mm}^4$
Moment of inertia about minor axis, $I_y = 7.324(10)^6 \text{ mm}^4$

Major axis section modulus, $Z_z = 627.2(10)^3 \text{ mm}^3$

Minor axis section modulus, $Z_y = 97.66(10)^3 \text{ mm}^3$

Torsional constant, $J = 26.87(10)^3 \text{ mm}^4$

Warping constant, $C_W = 150.6(10)^9 \text{ mm}^6$

Radius of gyration about major axis, $r_z = \sqrt{\frac{I_z}{A}} = 124.3 \text{ mm}$

Radius of gyration about minor axis, $r_y = \sqrt{\frac{I_y}{A}} = 34.67 \text{ mm}$

Section Classification

For webs of beams in bending (Cl. 8.5):

\[
\frac{d}{t_w} = \frac{274}{8} = 34.25 < 2.4 \sqrt{\frac{E}{F}} = 2.4 \sqrt{\frac{205,000}{235}} = 70.89
\]

Depth to thickness ratio is "OK".

For flanges of beams in bending (Cl. 8.3):

\[
\frac{B}{t_f} = \frac{150}{13} = 11.54 < 1.6 \sqrt{\frac{E}{F}} = 1.6 \sqrt{\frac{205,000}{235}} = 47.26
\]

Depth to thickness ratio is "OK".

Allowable Compressive Stress

The slenderness ratio of compression members (Cl. 11.1):

\[
\lambda_y = \frac{K_y \times L_y}{r_y} = \frac{1 \times 5,000}{34.67} = 144.2
\]

Slenderness ratio dividing elastic and inelastic buckling (Cl no 5.5):

\[
\Lambda = \sqrt{\frac{F^2 \times E}{0.6 \times F^2}} = \sqrt{\frac{235^2 \times 205,000}{0.6 \times 235}} = 119.8
\]

\[
\nu = \frac{3}{2} + \frac{2}{3} \times \left(\frac{\lambda}{\Lambda}\right)^2 = \frac{3}{2} + \frac{2}{3} \times \left(\frac{144.2}{119.8}\right)^2 = 2.466
\]

\[
\lambda > \Lambda, \text{ so the allowable compressive stress is given by Cl. 5.4:}
\]

\[
f_c = \frac{0.277 \times F}{\left(\frac{\lambda}{\Lambda}\right)^2} = \frac{0.277 \times 235}{\left(\frac{144.2}{119.8}\right)^2} = 44.92 \text{ MPa}
\]

Allowable Flexural Stress

Distance between braced points of the compression flange, $l_b = 5,000 \text{ mm}$.

The yield moment, $M_y = F \times Z_z = \frac{235 \times 627.2(10)^3}{10^6} = 147.4 \text{ kN} \cdot \text{m}$

The modification factor for allowable flexural stress (Cl. 5.13):

\[
C = 1
\]
The elastic lateral-torsional buckling moment (Cl 5.12):

\[ M_e = C \times \frac{n^4 \times E \times I_y \times E \times I_w}{l_b^4} + \frac{n^2 \times E \times I_y \times G \times J}{l_b^2} \]

\[ = \frac{n^4 \times 205,000 \times 7.324 \times 10^6 \times 205,000 \times 150.6 \times 10^9}{5,000^4} = 7.22 \times 10^{15} \]

\[ = \frac{n^2 \times 205,000 \times 7.324 \times 10^6 \times 79,000 \times 26.87 \times 10^3}{5,000^2} = 1.258 \times 10^{15} \]

\[ = 1.0 \times \sqrt{7.224 \times 10^{15} + 1.258 \times 10^{15}} = 140.6 \text{ kN m} \]

The maximum slenderness ratio to achieve the plastic strength (Cl. 5.12):

\[ p\lambda_b = 0.3 \]

The elastic slenderness limit:

\[ e\lambda_b = \frac{1}{\sqrt{0.6}} = 1.291 \]

Slenderness ratio of the flexural member, \( \lambda_b = \sqrt{\frac{M_y}{M_e}} = 1.024 \)

Here, \( p\lambda_b < \lambda_b \leq e\lambda_b \), so:

\[ \nu = \frac{3}{2} + \frac{2}{3} \times \left( \frac{\lambda_b}{e\lambda_b} \right)^2 = \frac{3}{2} + \frac{2}{3} \times \left( \frac{1.024}{1.291} \right)^2 = 1.919 \]

\[ f_b = \frac{1 - 0.4 \times \frac{\lambda_b - p\lambda_b}{e\lambda_b - p\lambda_b} \times F}{\nu} = \frac{1 - 0.4 \times \frac{1.024 - 0.3}{1.291 - 0.3} \times 235}{1.919} = 86.68 \text{ MPa} \]

### V.AIJ 2005 UPT Tee

Verify the bending capacity and compression capacity of a tee section beam.

#### Details

The member is a 2 m long simply-supported beam. The section used is a CT100x200x8x12. The steel has a yield strength of 235 MPa, a modulus of elasticity of $205 \times 10^3$ MPa, and a shear modulus of $79 \times 10^3$ MPa.

The member is subject to the following loads:

- A -10 kN concentrated force at mid-span in the global Y direction
- A -2 kN·m concentrated moment at the left end
- A 2 kN·m concentrated moment at the right end

#### Validation

**Section Properties**

Dimensions:

- Leg, $D = 100$ mm
- Width, $B = 200$ mm
- Thickness of web, $t_w = 8$ mm
- Thickness of flange, $t_f = 12$ mm

Depth of web, $d = D - t_f = 88$ mm

Area, $A_x = 3,104$ mm$^2$

Moment of inertia about major axis, $I_z = 1.844(10)^6$ mm$^4$

Moment of inertia about minor axis, $I_y = 8.004(10)^6$ mm$^4$

Major axis section modulus, $Z_z = 22.31(10)^3$ mm$^3$
Minor axis section modulus, $Z_y = 80.04(10)^3 \text{ mm}^3$

Torsional constant, $J = 130(10)^3 \text{ mm}^4$

Warping constant, $C_W = 107.8(10)^9 \text{ mm}^6$

Radius of gyration about major axis, $r_z = \sqrt{\frac{I_z}{A}} = 24.07 \text{ mm}$

Radius of gyration about minor axis, $r_y = \sqrt{\frac{I_y}{A}} = 50.21 \text{ mm}$

Section Classification
For webs of beams in bending (Cl. 8.5):
\[
\frac{d}{t_w} = \frac{88}{8} = 11 < 0.53\sqrt{\frac{E}{F}} = 0.53\sqrt{\frac{205,000}{235}} = 15.65
\]

Depth to thickness ratio is “OK”.

Allowable Compressive Stress
The slenderness ratio of compression members (Cl. 11.1):
\[
\lambda_z = \frac{K_z \times L_z}{r_z} = \frac{1 \times 2,000}{24.07} = 83.11
\]

Slenderness ratio dividing elastic and inelastic buckling (Cl no 5.5):
\[
\Lambda = \sqrt{\frac{\pi^2 E}{0.6 \times F}} = \sqrt{\frac{\pi^2 \times 205,000}{0.6 \times 235}} = 119.8
\]
\[
v = \frac{3}{2} + \frac{2}{3} \times \left(\frac{\lambda}{\Lambda}\right)^2 = \frac{3}{2} + \frac{2}{3} \times \left(\frac{83.11}{119.8}\right)^2 = 1.821
\]

$\lambda < \Lambda$, so the allowable compressive stress is given by Cl. 5.3:
\[
f_c = \frac{1 - 0.4(\frac{\Lambda}{\lambda})^2}{v} \times F = \frac{1 - 0.4(\frac{83.11}{119.8})^2}{1.821} \times 235 = 104.2 \text{ MPa}
\]

Allowable Flexural Stress
Distance between braced points of the compression flange, $l_b = 2,000 \text{ mm}$.

The yield moment, $M_y = F \times Z_z = \frac{235 \times 80.04(10)^3}{10^6} = 18.8 \text{ kN m}$

The modification factor for allowable flexural stress (Cl. 5.13):
\[
C = 1
\]

The elastic lateral-torsional buckling moment (Cl 5.12):
\[
M_e = C \times \sqrt{\frac{n^4 \times E \times I_y \times E \times I_w}{l_b^4} + \frac{n^2 \times E \times I_y \times G \times J}{l_b^2}}
\]
\[
= \frac{n^4 \times 205,000 \times 1.844 \times 10^6 \times 205,000 \times 107.8 \times 10^9}{2,000^4} = 50.86 \times 10^{15}
\]
\[
\frac{n^2 \times E \times I_y \times G \times J}{t_b^2} = \frac{n^2 \times 205,000 \times 1.844 \times 10^6 \times 79,000 \times 13 \times 10^3}{2,000^2} = 0.958 \times 10^{15}
\]

\[
= 1.0 \times \sqrt{50.86 \times 10^{15} + 0.958 \times 10^{15}} = 98.03 \text{ kN m}
\]

The maximum slenderness ratio to achieve the plastic strength (Cl. 5.12):

\[p \lambda_b = 0.6\]

The elastic slenderness limit:

\[e \lambda_b = \frac{1}{\sqrt{0.6}} = 1.291\]

Slenderness ratio of the flexural member, \(\lambda_b = \sqrt{\frac{M_y}{M_e}} = 0.43\)

Here, \(\lambda_b < p \lambda_b\), so:

\[
\nu = \frac{3}{2} + \frac{2}{3} \times \left( \frac{\lambda_b}{e \lambda_b} \right)^2 = \frac{3}{2} + \frac{2}{3} \times \left( \frac{0.43}{1.291} \right)^2 = 1.573
\]

\[f_b = \frac{F}{V} = \frac{235}{1.573} = 149.4 \text{ MPa}\]

- [D9.B.2 Member Capacities](on page 1711)

**V. New Zealand**

**V.NZS3404 1997-Angle section compact**

Verify the design capacity of compact angle section as per NZ3404 1997.

**Details**

The member is an A150X150X19 section used in a 5 m cantilever member. The cantilever is loaded with a 2 kN point load at the free end. Steel grade is 280 MPa.

**Validation**

**Section Classification**

\[
\lambda_{ef} = \frac{B}{2r_f} \sqrt{\frac{f_y}{250}} = \frac{150}{19} \sqrt{\frac{280}{250}} = 7.297
\]
Section classification is compact.

**Section Bending Capacity About Z-Axis**

Effective Section Modulus, $Z_{ez} = 110,960 \text{ mm}^3$

The nominal section capacity in bending about Z axis, $M_{sz} = \phi f_y \times Z_{ez}$

\[ M_{sz} = 280 \times 110,960 / 10^6 = 31.07 \text{ kN} \cdot \text{m} \]

\[ \phi M_{sz} = 0.9 \times 31.07 = 27.962 \text{ kN} \cdot \text{m} \]

**Section Bending Capacity About Y-Axis**

Effective Section Modulus, $Z_{ey} = 248,967 \text{ mm}^3$

The nominal section capacity in bending about Z axis, $M_{sy} = \phi f_y \times Z_{ey}$

\[ M_{sy} = 280 \times 248,967 / 10^6 = 69.71 \text{ kN} \cdot \text{m} \]

\[ \phi M_{sy} = 0.9 \times 69.71 = 62.74 \text{ kN} \cdot \text{m} \]

**Member Bending Capacity**

End restraint arrangement = FU

A twist restraint factor, $K_t = 1.0$

Minor axis rotation restraints = Both

Lateral rotation restraint factor, $K_r = 1.0$

Load Height factor, $K_l$ (LHT) = 1.00 [Ref : Table 5.6.3(2)]

Effective length = $1 \times 1 \times 0.7 \times 9,000 = 6,300 \text{ mm}$

\[ \alpha_m = \frac{1.7 M_m^*}{\sqrt{(M_2^*)^2 + (M_3^*)^2 + (M_4^*)^2}} \leq 2.5 \]

\[ \alpha_m = 1.25 \]

Reference buckling moment, $M_o$

\[ M_o = \sqrt{\frac{\pi^2 EI_e}{L e^4} \left[ GJ + \left( \frac{\pi^2 EI_w}{L e^4} \right) \right]} = 137.62 \text{ kN} \cdot \text{m} \]

\[ \alpha_s = 0.6 \sqrt{\left( \frac{M_{sy}}{M_{oa}} \right)^2 + 3 \left( \frac{M_{sy}}{M_{oa}} \right)} = 0.780 \]

[Ref : Clause 5.6.1.1 (c)]

\[ M_{bx} = \alpha_m \alpha_s M_{sy} \leq M_{sy} \]

\[ M_{bx} = 1.25 \times 0.780 \times 69.71 = 67.98 \text{ kN} \cdot \text{m} \leq (M_{sz}, M_{sy})_{\text{Max.}} \]

[Ref : Clause 5.6.1.1.1(a)]

\[ \phi M_{bz} = 0.9 \times 67.98 = 61.17 \text{ kN} \cdot \text{m} \]

**Check for Shear**

Shear Area of the section, $A_y = d \times t_w = 150 \times 19 = 2,850 \text{ mm}^2$

Section Shear Capacity (Along Y axis), $V_y = 0.6 f_y \cdot A_y = 0.6 \times 280 \times 2,850 = 478 \text{ kN}$

\[ V_{vn} = 2 \times 478 / (0.9 + 1.2) = 456 \text{ kN} \]

\[ \phi V_y = 0.9 \times 456 = 410.4 \text{ kN} \]

Shear Area of the section, $A_Z = b_f \times t_f = 150 \times 19 = 2,850 \text{ mm}^2$
Section Shear Capacity (Along z axis), \( V_z = 0.6 \times f_y \times A_z = 0.6 \times 280 \times 2,850 = 478 \, kN \)

\[ V_{vn} = 2 \times 478/(0.9 + 1.2) = 456 \, kN \]

\[ \phi V_z = 456 \times 0.9 = 410.4 \, kN \]

Check for Axial Compression

Section Compression Capacity:

Gross Area, \( A_g = 5,360 \, mm^2 \)

Net Area, \( A_n = 5,360 \, mm^2 \)

Form factor, \( K_f = A_e/A_g = 1 \)

The nominal member section capacity for axial compression,

\[ N_s = K_f \times A_n \times f_y = 1 \times 5,360 \times 280 = 1500.8 \, kN \]

\[ \phi N_s = 0.9 \times 1500.8 = 1350.7 \, kN \]

[Ref : Clause 6.2.1]

Member Compression Capacity

Length of the member, \( L = 5,000 \, mm \)

Effective length factor for slenderness & buckling about minor Y- axis, \( K_f = 1.00 \)

Effective length factor for slenderness & buckling about minor Z- axis, \( K_z = 1.00 \)

Effective Length of member, \( L_{ez} = 5,000 \, mm \)

Effective Length of member, \( L_{ey} = 5,000 \, mm \)

Geometrical Slenderness Ratio = \( L_{ez}/r_z = 5,000 / 29.3 = 170.648 \)

Geometrical Slenderness Ratio = \( L_{ey}/r_y = 5,000 / 57.362 = 87.166 \)

Member slenderness,

\[ \lambda_{nz} = \frac{L_{ez}}{r} \sqrt{K_f \sqrt{\frac{f_y}{290}}} = 170.648 \sqrt{\sqrt{\frac{280}{290}}} = 180.097 \]

[Ref : Clause 6.3.3]

\[ \lambda_{ny} = \frac{L_{ey}}{r} \sqrt{K_f \sqrt{\frac{f_y}{290}}} = 87.166 \sqrt{\sqrt{\frac{280}{290}}} = 92.248 \]

[Ref : Clause 6.3.3]

\[ \alpha_{az} = 2,100 \times (\lambda_{nz} - 13.5)/(\lambda_{nz}^2 - 15.3\lambda_{nz} + 2,050) = 10.999 \]

\[ \alpha_{ay} = 2,100 \times (\lambda_{ny} - 13.5)/(\lambda_{ny}^2 - 15.3\lambda_{ny} + 2,050) = 18.077 \]

\[ \alpha_b = 0.5 \]

[Ref : Table 6.3.3(2)]

\[ \lambda_z = \lambda_{nz} + \alpha_{az} \times \alpha_z = 186.097 \]

\[ \lambda_y = \lambda_{ny} + \alpha_{ay} \times \alpha_b = 101.286 \]

\[ \eta = 0.563 \]

\[ \eta = 0.286 \]

\[ \xi_z = ((\lambda_z/90)^2 + 1 + \eta)/(2 \times (\lambda_z/90)^2) = 0.683 \]

\[ \xi_y = ((\lambda_y/90)^2 + 1 + \eta)/(2 \times (\lambda_y/90)^2) = 1.008 \]

\[ \alpha_{cz} = 0.201 \]

\[ \alpha_{cy} = 0.532 \]
The nominal member capacity,
\[ N_{cz} = \alpha_{cz} \times N_s = 0.201 \times 1,500.8 = 301.388 \text{ kN} \]
\[ \phi N_{cz} = 271.3 \text{ kN} \]

The nominal member capacity,
\[ N_{cy} = \alpha_{cy} \times N_s = 0.532 \times 1,500.8 = 798.946 \text{ kN} \]
\[ \phi N_{cy} = 719.1 \text{ kN} \]

Nominal Section tension Capacity

\[ K_{te} = 1.00 \]
\[ N_{t1} = A_g \times f_y = 1,500.8 \text{ kN} \]
\[ N_{t2} = 0.85 \times K_{te} \times A_n \times f_u = 2,004.6 \text{ kN} \]
\[ \phi N_{t} = 1,350.7 \text{ kN} \]

STAAD.Pro Input File

The file C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\New Zealand\NZS3404 1997-Angle section compact.std is typically installed with the program.

The following D11.A.6 Design Parameters (on page 1763) are used:
- The twist restraint factor, \( K_t = 1 \) is specified by SKT 1.0 (default value; \( K_t \) is calculated)
• The lateral rotation restraint factor, $K_r = 1.0$ is specified by SKR 1.0 (default value; $K_r$ is calculated)

**MEMBER DESIGN OUTPUT FOR PMEMBER 1**

**DESIGN Notes**

1. (*) next to a Load Case number signifies that a P-Delta analysis has not been performed for that particular Load Case; i.e. analysis does not include second-order effects.
2. $\phi = 0.9$ for all the calculations [NZS3404 Table 3.4]
3. (#) next to Young's modulus $E$ indicates that its value is not 200000 MPa as per NZS3404 1.4.

- **D11A.5.1 Analytical Member Design** (on page 1757)

**V.NZS3404 1997-Angle section Non compact**

Verify the design capacity of equal leg, non-compact angle section as per NZ3404 1997.

**Details**

The member is an A150X150X12 section used in a 5 m cantilever member. The cantilever is loaded with a 2 kN point load at the mid-point. Steel grade is 300 MPa.

**Validation**

**Section Classification**

Evaluate the slenderness effects of the beam flanges:

\[
\lambda_{ef} = \frac{B}{t_f} \sqrt{\frac{f_y}{250}} = \frac{138}{12} \sqrt{\frac{300}{250}} = 12.60
\]

Section flange classification is non-compact.

Evaluate the slenderness effects of the beam web:

\[
\lambda_{ew} = \frac{d}{t_{ew}} \sqrt{\frac{f_y}{250}} = \frac{138}{12} \sqrt{\frac{300}{250}} = 12.60
\]

Section web classification is non-compact

**Section Bending Capacity About Z-Axis**

Effective Section Modulus, \(Z_{ez} = 72,560 \text{ mm}^3\)

The nominal section capacity in bending about Z axis, \(M_{ez} = \phi_f \cdot Z_{ez}\)

\[
M_{ez} = 300 \times 72,560 / 10^6 = 21.77 \text{ kN} \cdot \text{m}
\]

\[
\phi M_{ez} = 0.9 \times 21.77 = 19.59 \text{ kN} \cdot \text{m}
\]

**Section Bending Capacity About Y-Axis**

Effective Section Modulus, \(Z_{ey} = 155,980 \text{ mm}^2\)

The nominal section capacity in bending about Z axis, \(M_{ey} = \phi_f \cdot Z_{ey}\)

\[
M_{ey} = 300 \times 155,980 / 10^6 = 46.79 \text{ kN} \cdot \text{m}
\]

\[
\phi M_{ey} = 0.9 \times 46.79 = 42.11 \text{ kN} \cdot \text{m}
\]

**Member Bending Capacity**

End restraint arrangement = FU

A twist restraint factor, \(K_t = 1.00\)
Lateral rotation restraint factor, $K_r = 1.0$
Load Height factor, $K_l = 1.00$ [Ref: Table 5.6.3(2)]
Effective length = $1 \times 1 \times 1 \times 5,000 = 5,000$ mm

$$\alpha_m = \frac{1.7M^*}{\sqrt{\left(M_2^*\right)^2 + \left(M_3^*\right)^2 + \left(M_4^*\right)^2}} \leq 2.5$$

$$\alpha_m = 1.25$$

Reference buckling moment, $M_o$

$$M_o = \sqrt{\left(\frac{n^2EI_y}{L^2} \cdot GJ \right) + \left(\frac{n^2EI_w}{L^2} \cdot GJ \right)} = 57.42 \text{ kN} \cdot \text{m}$$

$$\alpha_s = 0.6 \left(\frac{M_{sy}}{M_{oa}}\right)^2 + 3 \cdot \left(\frac{M_{sy}}{M_{oa}}\right) = 0.660$$

$M_{bz} = \alpha_m \alpha_s M_{sy} \leq M_{sy}$

$M_{bz} = 1.25 \times 0.660 \times 46.79 = 38.61 \text{ kN} \cdot \text{m}$ [Ref: Clause 5.6.1.1(a)]

Check for Shear

Shear Area of the section, $A_y = d \times t_w = 150 \times 12 = 1,800$ mm$^2$

Section Shear Capacity (Along Y axis), $V_y = 0.6 \times f_y \times A_y = 0.6 \times 300 \times 1,800 = 324$ kN

$$V_{vn} = 2 \times 324/(0.9 + 1.2) = 308.6 \text{ kN}$$

$$\phi V_y = 0.9 \times 308.6 = 277.7 \text{ kN}$$

Shear Area of the section, $A_z = b_f \times t_f = 150 \times 12 = 1,800$ mm$^2$

Section Shear Capacity (Along z axis), $V_z = 0.6 \times f_y \times A_z = 0.6 \times 300 \times 1,800 = 324$ kN

$$V_{vn} = 2 \times 324/(0.9 + 1.2) = 308.6 \text{ kN}$$

$$\phi V_z = 0.9 \times 308.6 = 277.7 \text{ kN}$$

Check for Axial Compression

Section Compression Capacity:

Gross Area, $A_g = 3,480$ mm$^2$

Net Area, $A_n = 3,480$ mm$^2$

Form factor, $K_f = A_n/A_g = 1$

The nominal member section capacity for axial compression,

$$N_n = K_f \times A_n \times f_y = 1 \times 3,480 \times 300 = 1,044 \text{ kN}$$

$$\phi N_n = 0.9 \times 1,044 = 939.6 \text{ kN}$$

Member Compression Capacity

Length of the member, $L = 5,000$ mm

Effective length factor for slenderness & buckling about minor Y-axis, $K_y = 2.2$
Effective length factor for slenderness & buckling about minor Z-axis, $K_z = 2.2$

Effective Length of member, $L_{ez} = 2.2 \times 5,000 \text{ mm} = 11,000 \text{ mm}$

Effective Length of member, $L_{ey} = 2.2 \times 5,000 \text{ mm} = 11,000 \text{ mm}$

Geometrical Slenderness Ratio = $L_{ez}/r_z = 11,000 / 29.6 = 371.62$

Geometrical Slenderness Ratio = $L_{ey}/r_y = 11,000 / 58.609 = 187.7$

Member slenderness,

$$\lambda_{nz} = \frac{L_{ez}}{r_z \sqrt{\frac{f_y}{250}}} = \frac{371.62}{\sqrt{\frac{250}{250}}} = 407.1$$

[Ref : Clause 6.3.3]

$$\lambda_{ny} = \frac{L_{ey}}{r_y \sqrt{\frac{f_y}{250}}} = \frac{187.7}{\sqrt{\frac{250}{250}}} = 205.6$$

[Ref : Clause 6.3.3]

$$\alpha_{az} = 2,100 \times (\lambda_{nz} - 13.5) / (\lambda_{nz}^2 - 15.3 \lambda_{nz} + 2,050) = 5.116$$

$$\alpha_{ay} = 2,100 \times (\lambda_{ny} - 13.5) / (\lambda_{ny}^2 - 15.3 \lambda_{ny} + 2,050) = 9.797$$

$$\alpha_b = 0.5$$

[Ref : Table 6.3.3(2)]

$$\lambda_z = \lambda_{nz} + \alpha_{az} \times \alpha_z = 409.65$$

$$\lambda_y = \lambda_{ny} + \alpha_{ay} \times \alpha_b = 210.50$$

$$\eta = 1.29$$

$$\eta = 0.64$$

$$\xi_z = ((\lambda_z/90)^2 + 1 + \eta)/(2 \times (\lambda_z/90)^2) = 0.56$$

$$\xi_y = ((\lambda_y/90)^2 + 1 + \eta)/(2 \times (\lambda_y/90)^2) = 0.65$$

$$\alpha_{cz} = 0.045$$

$$\alpha_{cy} = 0.160$$

The nominal member capacity,

$$N_{cz} = \alpha_{cz} \times N_s = 0.045 \times 1,044 = 46.98 \text{ kN}$$

$$\phi N_{cz} = 42.28 \text{ kN}$$

The nominal member capacity,

$$N_{cy} = \alpha_{cy} \times N_s = 0.160 \times 1,044 = 167.0 \text{ kN}$$

$$\phi N_{cy} = 150.3 \text{ kN}$$

Nominal Section tension Capacity [Ref : Clause 7.1]

$$K_{te} = 1.00$$

$$N_{t1} = A_g \times f_y = 1,044 \text{ kN}$$

$$N_{t2} = 0.85 \times K_{te} \times A_n \times f_u = 1,301.5 \text{ kN}$$

$$\phi N_t = 0.9 \times 1,044 = 939.6 \text{ kN}$$

[Ref : Clause 5.6.1.1.1(a)]

MEMBER DESIGN OUTPUT FOR PMEMBER 1
DESIGN Notes
---

1. (*) next to a Load Case number signifies that a P-Delta analysis has
not been performed for that particular Load Case; i.e. analysis does not include second-order effects.

2. $\varphi = 0.9$ for all the calculations [NZS3404 Table 3.4]
3. (#) next to Young's modulus $E$ indicates that its value is not 200000 MPa as per NZS3404 1.4.

### DESIGN SUMMARY

**Designation:** ST A150X150X12 (AISC SECTIONS)

**Governing Load Case:** 1*

**Criteria:**

**Governing Ratio:** 1.400 *(FAIL)

**Governing Location:** 0.000 m from Start.

### SECTION PROPERTIES

- $d$: 150.0000 mm
- $b$: 150.0000 mm
- $t$: 12.0000 mm
- $Ag$: 3480.0000 mm$^2$
- $J$: 167.0400E+03 mm$^4$
- $Iw$: 286.6545E+06 mm$^6$
- $Iz$: 3.0490E+06 mm$^4$
- $Sz$: 88.4845E+03 mm$^3$ (plastic)
- $Zz$: 65.3007E+03 mm$^3$ (elastic)
- $rz$: 29.6000E+00 mm
- $Iy$: 11.9540E+06 mm$^4$
- $Sy$: 176.0526E+03 mm$^3$ (plastic)
- $Zy$: 112.4115E+03 mm$^3$ (elastic)
- $ry$: 58.6094E+00 mm

### MATERIAL PROPERTIES

**Material Standard:** AS/NZS 3679.1

**Nominal Grade:** 300

**Residual Stress Category:** HR (Hot-rolled)

- $E$ (#): 204999.984 MPa [NZS3404 1.4]
- $G$: 80000.000 MPa [NZS3404 1.4]
- $fy$, flange: 300.000 MPa [NZS3404 Table 2.1]
- $fy$, web: 300.000 MPa [NZS3404 Table 2.1]
- $fu$: 440.000 MPa [NZS3404 Table 2.1]

**SLENDERNESS:**

**ACTUAL SLENDERNESS RATIO:** 168.919

**LOAD:** 1

**LOC:**

**ALLOWABLE SLENDERNESS RATIO:** 400.000

- D11A.5.1 Analytical Member Design (on page 1757)

V.NZS3404 1997-Channel Section
Verify the design capacity of a channel section per NZS 3404 1997.

Details
The member is a PFC250 section used in a 9 m simply supported span. The beam is loaded with a vertical load of 8.4 kN point load at 5m from start end, a 10 kN axial load at the mid-point, and a distributed load that decreases from 0.5 kN/m at the start down to 0.2 kN/m at the end. Steel grade is 300 MPa.
**Validation**

**Section Classification**

Evaluate the slenderness effects of the beam flanges:

\[ \lambda_{ef} = \frac{B}{2f} \sqrt{\frac{f_y}{250}} = \frac{90}{15} \sqrt{\frac{300}{250}} = 5.988 \]

Section flange classification is compact.

Evaluate the slenderness effects of the beam web:

\[ \lambda_{ew} = \frac{d}{t_w} \sqrt{\frac{f_y}{250}} = \frac{220}{8} \sqrt{\frac{300}{250}} = 30.124 < 89 \]

Section web classification is compact

**Section Bending Capacity About Z-Axis**

Effective Section Modulus, \( Z_{ez} = 421,000 \text{ mm}^3 \)

The nominal section capacity in bending about Z axis, \( M_{sz} = \phi f_y \times Z_{ez} \)

\[ M_{sz} = 300 \times 421,000/10^6 = 126.3 \text{ kN m} \]

\[ \phi M_{sz} = 0.9 \times 126.3 = 113.67 \text{ kN m} \]

**Section Bending Capacity About Y-Axis**

Effective Section Modulus, \( Z_{ey} = 88,925 \text{ mm}^3 \)

The nominal section capacity in bending about Z axis, \( M_{sy} = \phi f_y \times Z_{ey} \)

\[ M_{sy} = 300 \times 88,925/10^6 = 26.68 \text{ kN m} \]

\[ \phi M_{sy} = 0.9 \times 26.68 = 24.01 \text{ kN m} \]

**Member Bending Capacity**

End restraint arrangement = FF

A twist restraint factor, \( K_t \) (SKT) = 1.00

Minor axis rotation restraints = Both

Lateral rotation restraint factor, \( K_r \) (SKR) = 0.70

Load Height factor, \( K_l \) (LHT) = 1.00 \[Ref: Table 5.6.3(2)]

Effective length = 1×1×1×9,000 = 9,000 mm

\[ \alpha_m = \frac{1.7M_m^*}{\sqrt{(M_2)^2 + (M_3)^2 + (M_4)^2}} = \frac{1.7 \times 22.416}{\sqrt{(-12.087)^2 + (-22.416)^2 + (-12.087)^2}} = 1.352 \leq 2.25 \]

Reference buckling moment, \( M_o \)

\[ M_o = \left( \frac{E I_x}{L_e^2} \right) \left[ GJ + \left( \frac{E I_x}{L_e^2} \right) \right] = 42.25 \text{ kN m} \]

\[ \alpha_s = 0.6 \left( \frac{M_{sx}}{M_o} \right) + 3 \left( \frac{M_{sx}}{M_o} \right) = 0.281 \] \[\text{[Ref: Clause 5.6.1.1 (c)]}\]
\[
M_{bx} = \alpha_m \alpha_s M_{sx} \leq M_{sx} \\
M_{bz} = 1.352 \times 0.281 \times 126.3 = 48.0 \text{kN m} \leq (M_{sz}, M_{sy})_{\text{Max.}} \quad \text{[Ref: Clause 5.6.1.1.1(a)]}
\]

\[\phi M_{bz} = 0.9 \times 48.0 = 43.19 \text{kN m}\]

**Check for Shear**

Shear Area of the section, \(A_y = d \times t_w = 250 \times 8 = 2,000 \text{mm}^2\)

Section Shear Capacity (Along Y axis), \(V_y = 0.6 \times f_y \times A_y = 0.6 \times 300 \times 2,000 = 384 \text{kN}\)

\[V_{vn} = 2 \times 324 / (0.9 + 1.2) = 308.6 \text{kN}\]  
\[\phi V_y = 0.9 \times 384 = 345.6 \text{kN}\]

Shear Area of the section, \(A_Z = 2 \times b_f \times t_f = 2 \times 90 \times 15 = 2,700 \text{mm}^2\)

Section Shear Capacity (Along Z axis), \(V_z = 0.6 \times f_y \times A_z = 0.6 \times 300 \times 2,700 = 486 \text{kN}\)

\[\phi V_z = 0.9 \times 486 = 437.4 \text{kN}\]

**Check for Axial Compression**

Section Compression Capacity:

The flange slenderness, \(\lambda_{eb} = 5.9884 \quad \text{[Ref: Cl - 6.2.3.1]}\)

Yield slender for flange, \(\lambda_{eby} = 14 \quad \text{[Ref: Table 6.2.4]}\)

The web slenderness, \(\lambda_{ew} = 30.125\)

Gross Area, \(A_g = 4,520 \text{mm}^2\)

Net Area, \(A_n = 4,520 \text{mm}^2\)

Form factor, \(K_f = A_e / A_g = 1\)

The nominal member section capacity for axial compression, \(N_s = K_f \times A_n \times f_y = 1 \times 4,520 \times 300 = 1,356 \text{kN}\)  
\[\phi N_s = 0.9 \times 1,356 = 1,220.4 \text{kN}\]

**Member Compression Capacity**

Length of the member, \(L = 9,000 \text{mm}\)

Effective length factor for slenderness & buckling about minor Y- axis, \(K_y = 1.0\)

Effective length factor for slenderness & buckling about minor Z- axis, \(K_z = 1.0\)

Effective Length of member, \(L_{ez} = 1.0 \times 9,000 \text{mm} = 9,000 \text{mm}\)

Effective Length of member, \(L_{ey} = 1.0 \times 9,000 \text{mm} = 9,000 \text{mm}\)

Geometrical Slenderness Ratio \(= L_{ez} / r_z = 9,000 / 99.89 = 90.10\)

Geometrical Slenderness Ratio \(= L_{ey} / r_y = 9,000 / 28.37 = 317.2\)

Member slenderness,

\[\lambda_{nz} = \frac{L}{r} \sqrt{\frac{K_f}{250}} \sqrt{\frac{f_y}{250}} = 90.10 \sqrt{\frac{300}{250}} = 98.70 \quad \text{[Ref: Clause 6.3.3]}\]

\[\lambda_{ny} = \frac{L}{r} \sqrt{\frac{K_f}{250}} \sqrt{\frac{f_y}{250}} = 317.2 \sqrt{\frac{300}{250}} = 347.5 \quad \text{[Ref: Clause 6.3.3]}\]
\[ \alpha_{az} = 2,100 \times (\lambda_{nz} \cdot 13.5)/(\lambda_{nz}^2 - 15.3\lambda_{nz} + 2,050) = 17.402 \]
\[ \alpha_{ay} = 2,100 \times (\lambda_{ny} \cdot 13.5)/(\lambda_{ny}^2 - 15.3\lambda_{ny} + 2,050) = 5.970 \]
\[ \alpha_b = 0.5 \]
\[ \lambda_z = \lambda_{nz} + \alpha_{az} \times \alpha_z = 107.4 \]
\[ \lambda_y = \lambda_{ny} + \alpha_{ay} \times \alpha_b = 350.5 \]
\[ \eta = 0.31 \]
\[ \eta = 1.10 \]
\[ \xi_z = ((\lambda_z/90)^2 + 1 + \eta)/(2 \times (\lambda_z/90)^2) = 0.96 \]
\[ \xi_y = ((\lambda_y/90)^2 + 1 + \eta)/(2 \times (\lambda_y/90)^2) = 0.57 \]
\[ \alpha_{cz} = 0.493 \]
\[ \alpha_{cy} = 0.061 \]

The nominal member capacity,
\[ N_{cz} = \alpha_{cz} \times N_s = 0.493 \times 1,356 = 668.7 \text{ kN} \]
\[ \phi N_{cz} = 601.8 \text{ kN} \]

The nominal member capacity,
\[ N_{cy} = \alpha_{cy} \times N_s = 0.061 \times 1,356 = 82.72 \text{ kN} \]
\[ \phi N_{cy} = 74.44 \text{ kN} \]

Nominal Section tension Capacity

[Ref : Clause 7.1]
\[ K_{te} = 1.00 \]
\[ N_{t1} = A_g \times f_y = 1,356 \text{ kN} \]
\[ N_{t2} = 0.85 \times K_{te} \times A_g \times f_y = 1,690.5 \text{ kN} \]
\[ \phi N_t = 0.9 \times 1,356 = 1,220.4 \text{ kN} \]

STAAD.PRO CODE CHECKING - NZS-3404-1997 (v1.0)
*****************************************************************
AXIS NOTATION FOR ANY SECTION OTHER THAN ST ANGLE:--
STAAD.Pro     NZS3404 Spec.     Description
---------     -------------     ---------------
X/x             Z/z          Longitudinal axis of section
Y/y             Y/y          Minor principal axis of section
Z/z             X/x          Major Principal axis of section
MEMBER DESIGN OUTPUT FOR PMEMBER     1
DESIGN Notes
---------
1. (*) next to a Load Case number signifies that a P-Delta analysis has
not been performed for
that particular Load Case; i.e. analysis does not include second-order
effects.
2. ϕ = 0.9 for all the calculations [NZS3404 Table 3.4]
3. (#) next to Young's modulus E indicates that its value is not 200000
MPa as per NZS3404 1.4.
DESIGN SUMMARY
---------
Designation: ST   PFC250                   (AISC SECTIONS)
Governing Load Case:     1*
Governing Criteria: Cl.
8.4.5.1
Governing Ratio:  46.122 *(FAIL)
Governing Location:   2.250 m from Start.
SECTION PROPERTIES

**********************************************************************
**Verification Examples**

**V.09 Steel Design**

- *D11.A.5.1 Analytical Member Design* (on page 1757)

**V.NZS3404 1997-I section**

Verify the Design Capacity of I Section as per NZS3404 1997.

**Details**

Verify the Section bending capacity of an UB530X92.4. Span of the member = 9 m. Both ends of the member are simply supported.

**Loads:**

- Concentrated in the Y direction: 84.5 kN (at a distance of 5m from the left support)
- Concentrated in the Z direction: 10 kN (at mid-span)
- Concentrated in the X direction: 10 kN (at mid-span)

Fy = 300 MPa

**Validation**

**Section Classification**

Evaluate the slenderness effects of the beam flanges:

\[ \lambda_{ef} = \frac{B}{2t} \sqrt{\frac{f_y}{250}} = \frac{198.8}{2(15.6)} \sqrt{\frac{300}{250}} = 6.98 < 8 \]

Section flange classification is compact.

Evaluate the slenderness effects of the beam web:

\[ \lambda_{ew} = \frac{d}{t_w} \sqrt{\frac{f_y}{250}} = 501.8 \sqrt{\frac{300}{250}} = 56.89 < 89 \]

Section web classification is compact

**Section Bending Capacity About Z-Axis**

Effective Section Modulus, \( Z_{ez} = 2.37 \times 10^6 \text{ mm}^3 \)

The nominal section capacity in bending about Z axis, \( M_{sz} = \phi f_y \times Z_{ez} \)

\[ M_{sz} = 300 \times 2.37 = 711 \text{ kN m} \]

\[ \phi M_{sz} = 0.9 \times 700 = 639.9 \text{ kN m} \]

**Section Bending Capacity About Y-Axis**

Effective Section Modulus, \( Z_{ey} = 341.6 \times 10^3 \text{ mm}^2 \)

The nominal section capacity in bending about Z axis, \( M_{sy} = \phi f_y \times Z_{ey} \)

\[ M_{sy} = 300 \times 341.6 \times 10^3/10^6 = 102.5 \text{ kN m} \]

\[ \phi M_{sy} = 0.9 \times 102.5 = 92.23 \text{ kN m} \]

**Member Bending Capacity**

End restraint arrangement = FF

A twist restraint factor, \( K_t \) (SKT) = 1.00
Minor axis rotation restraints = Both
Lateral rotation restraint factor, \( K_r \) (SKR) = 0.70
Load Height factor, \( K_l \) (LHT) = 1.00 [Ref: Table 5.6.3(2)]
Effective length = 1×1×0.7×9,000 = 6,300 mm
\[
\alpha_m = \frac{1.7M_m^*}{\sqrt{(M_2^*)^2 + (M_3^*)^2 + (M_4^*)^2}} = \frac{1.7 \times 109.8}{\sqrt{(3.383)^2 + (-77.73)^2 + (-7.246)^2}} = 2.389 \leq 2.5
\]
Reference buckling moment, \( M_o \)
\[
M_o = \sqrt{\frac{n^2EI_y}{L_e^2}GJ + \frac{n^2EI_w}{L_e^2}} = 416.5 \text{ kN m}
\]
\[
\alpha_s = 0.6\left(\sqrt{\frac{M_{sx}}{M_{sy}}} + 3\right) \left(\frac{M_{sx}}{M_{sy}}\right) = 0.435 \quad \text{[Ref: Clause 5.6.1.1 (c)]}
\]
\[
M_{bz} = \alpha_m \alpha_s M_{sx} \leq M_{sx}
\]
\[
M_{bz} = 2.389 \times 0.435 \times 416.5 = 711.0 \text{ kN m} \leq (M_{sx}, M_{sy})_{\text{Max.}} \quad \text{[Ref: Clause 5.6.1.1.1(a)]}
\]
\[
\phi M_{bz} = 0.9 \times 711.0 = 639.9 \text{ kN m}
\]
Check for Shear
Shear Area of the section, \( A_y = d \times t_w = 533 \times 10.2 = 5,437 \text{ mm}^2 \)
Section Shear Capacity (Along Y axis), \( V_y = 0.6 \times f_y \times A_y = 0.6 \times 300 \times 5,437 = 1,044 \text{ kN} \)
\[
\phi V_y = 0.9 \times 1,044 = 939.4 \text{ kN}
\]
Shear Area of the section, \( A_z = 2 \times b_f \times t_f = 2 \times 209 \times 15.6 = 6,521 \text{ mm}^2 \)
Section Shear Capacity (Along z axis), \( V_z = 0.6 \times f_y \times A_z = 0.6 \times 300 \times 6,521 = 1,174 \text{ kN} \)
\[
\phi V_z = 0.9 \times 1,174 = 1,056 \text{ kN}
\]
Check for Axial Compression
Section Compression Capacity:
The flange slenderness, \( \lambda_{eb} = 6.98 \) [Ref: Cl - 6.2.3.1]
Yield slender for flange, \( \lambda_{eby} = 16 \) [Ref: Table 6.2.4]
The web slenderness, \( \lambda_{ew} = 55.66 \)
Gross Area, \( A_g = 11,800 \text{ mm}^2 \)
Net Area, \( A_n = 11,800 \text{ mm}^2 \)
Form factor, \( K_f = A_e/A_g = 0.92 \)
The nominal member section capacity for axial compression,
\[
N_s = K_f \times A_g \times f_y = 0.92 \times 11,800 \times 300 = 3,257 \text{ kN} \quad \text{[Ref: Clause 6.2.1]}
\]
\[
\phi N_s = 0.9 \times 3,257 = 2,931 \text{ kN}
\]
Member Compression Capacity
Length of the member, \( L = 9,000 \text{ mm} \)
Effective length factor for slenderness & buckling about minor Y-axis, $K_y = 1.0$

Effective length factor for slenderness & buckling about minor Z-axis, $K_z = 1.0$

Effective Length of member, $L_{ez} = 1.0 \times 9,000 \text{ mm} = 9,000 \text{ mm}$

Effective Length of member, $L_{ey} = 1.0 \times 9,000 \text{ mm} = 9,000 \text{ mm}$

$r_z = \sqrt{(554 \times 10^6 / 11,800)} = 216.7$

$r_y = \sqrt{(23.8 \times 10^6 / 11,800)} = 44.91$

Geometrical Slenderness Ratio $= L_{ez} / r_z = 9,000 / 216.7 = 41.54$

Geometrical Slenderness Ratio $= L_{ey} / r_y = 9,000 / 44.91 = 200.4$

Member slenderness,

$$\lambda_{nz} = \frac{L_{ez}}{r_z} \sqrt{K_y \sqrt{\frac{f_y}{200}}} = 41.54 \sqrt{1 \sqrt{\frac{300}{250}}} = 43.57$$

$$\lambda_{ny} = \frac{L_{ey}}{r_y} \sqrt{K_y \sqrt{\frac{f_y}{200}}} = 200.4 \sqrt{1 \sqrt{\frac{300}{250}}} = 210.1$$

$$\alpha_{az} = 2,100 \times (\lambda_{nz} \cdot 13.5) / (\lambda_{nz}^2 \cdot 15.3 \lambda_{nz} + 2,050) = 19.24$$

$$\alpha_{ay} = 2,100 \times (\lambda_{ny} \cdot 13.5) / (\lambda_{ny}^2 \cdot 15.3 \lambda_{ny} + 2,050) = 9.60$$

$$\alpha_b = 0.0$$

$$\lambda_z = \lambda_{nz} + \alpha_{az} \times \alpha_z = 43.57$$

$$\lambda_y = \lambda_{ny} + \alpha_{ay} \times \alpha_b = 210.1$$

$$\eta = 0.10$$

$$\eta = 0.64$$

$$\xi_z = ((\lambda_z / 90)^2 \cdot 1 + \eta) / (2 \times (\lambda_z / 90)^2) = 2.84$$

$$\xi_y = ((\lambda_y / 90)^2 \cdot 1 + \eta) / (2 \times (\lambda_y / 90)^2) = 0.65$$

$$\alpha_{cz} = 0.89$$

$$\alpha_{cy} = 0.16$$

The nominal member capacity,

$$N_{cz} = \alpha_{cz} \times N_s = 0.89 \times 3,246 = 2,888 \text{ kN}$$

$$\phi N_{cz} = 2,600 \text{ kN}$$

The nominal member capacity,

$$N_{cy} = \alpha_{cy} \times N_s = 0.16 \times 3,246 = 521.9 \text{ kN}$$

$$\phi N_{cy} = 470 \text{ kN}$$

Combined Bending and Axial

Section Combined Capacity (About Z-axis) $\leq M_{sz}$

$$M_{rz} = 1.18 \times M_{sz} \times (1 - N / \phi N_{sz}) = 837.54 \text{ kN m}$$

$$M_{rz} = 1.18 \times M_{sz} \times (1 - N / \phi N_{sz}) = 837.54 \text{ kN m}$$

$$\phi M_{rz} = 639.90 \text{ kN m}$$
Section Combined Capacity (About y-axis) ≤ M

\[ M_{rz} = 1.19 \times M_{sy} \times (1 - (N/\phi N_{sy})^2) = 121.96 \text{ kN m} \]
\[ \phi M_{rz} = 92.239 \text{ kN m} \]

Section Combined Capacity (Biaxial) [Ref: CI - 8.1.5]

\[ \lambda = 1.4 + (N/\phi N_s) = 1.402 \]
\[ (M_x/\phi M_{rx})\lambda + (M_y/\phi M_{ry})\lambda = 0.14 \]

Member in-plane Capacity (Z-axis) \( M_{iz} \leq M_{rz} \)

\[ M_{iz} = M_{sz} \left[ \left( 1 + (1 + \beta m/2)^3 \right)(1 - N/\phi N_{cz}) + 1.18(1 + (1 + \beta m/2)^3)\sqrt{1 - N/\phi N_{cz}} \right] = 709.63 \text{ kN m} \]
\[ \phi M_{iz} = 638.67 \text{ kN m} \]

Member in-plane Capacity (y-axis) \( M_{iy} \leq M_{ry} \) [Ref: CI - 8.4.4.2.2]

\[ M_{sy} \left[ \left( 1 + (1 + \beta m/2)^3 \right)(1 - N_y/\phi N_{cy}) + 1.18(1 + (1 + \beta m/2)^3)\sqrt{1 - N_y/\phi N_{cy}} \right] = 101.40 \text{ kN m} \]
\[ \phi M_{iy} = 91.26 \text{ kN m} \]

Member Out-of-plane Capacity (Tension) [Ref: CI - 8.4.4.2]

\[ M_{oxt} = M_{bz}(1 + N/\phi N_t) = 712.12 \text{ kN m} \]

Nominal out-plane member moment capacity, \( M_{oxt} = 711.00 \text{ kN-m} \)

\[ \phi M_{oxt} = 639.90 \text{ kN m} \]

Member Out-of-plane Capacity(Compression) \( M_{ox} \leq M_{rz} \) [Ref: CI - 8.4.4.1]

\[ M_{oz} = M_{bz}(1 - N/\phi N_{cy}) = 703.43 \text{ kN m} \]
\[ \phi M_{ozc} = 633.09 \text{ kN m} \]

Member Biaxial Capacity (Compression)

\[ M_{cz} = 709.63 \text{ kN m} \]
\[ \phi M_{cz} = 638.67 \text{ kN m} \]
\[ (M_x/\phi M_{cx})1.4 + (M_y/\phi M_{cy})1.4 = 0.139 \]

Member Biaxial Capacity (tension)

\[ M_{tx} = 711.00 \text{ kN m} \]
\[ \phi M_{tx} = 639.90 \text{ kN m} \]
\[ (M_x/\phi M_{tx})1.4 + (M_y/\phi M_{ty})1.4 = 0.116 \]

### V.NZS3404 1997-RHS Section

Verify the design capacity of a rectangular hollow section as per NZS3404 1997.

**Details**

Verify the section bending capacity of an HSST20X12X75 spanning 6 m. Steel grade is 250 MPa.
Note: This is the left column in the STAAD.Pro model (i.e., physical member no. 2).

Validation

Section Classification

Evaluate the slenderness effects of the Y axis:

\[
\lambda_{ef} = \frac{B}{2f} \sqrt{\frac{T_y}{250}} = \frac{269.3}{2(17.73)} \sqrt{\frac{250}{250}} = 15.19
\]

Section classification is compact.

Evaluate the slenderness effects of the Z axis:

\[
\lambda_{ew} = \frac{d}{t_w} \sqrt{\frac{T_y}{250}} = \frac{472.5}{17.73} \sqrt{\frac{250}{250}} = 26.65
\]

Section classification is compact

Section Bending Capacity About Z-Axis

Effective Section Modulus, \(Z_{ez} = 4.425 \times 10^6 \text{ mm}^3\)

The nominal section capacity in bending about Z axis, \(M_{sz} = \phi f_y \times Z_{ez}\)

\[
M_{sz} = 250 \times 4.425 \times 10^6 = 1,106 \text{ kN m}
\]

\[
\phi M_{sz} = 0.9 \times 1,106 = 995.6 \text{ kN m}
\]

Section Bending Capacity About Y-Axis

Effective Section Modulus, \(Z_{ey} = 3.114 \times 10^6 \text{ mm}^3\)

The nominal section capacity in bending about Z axis, \(M_{sy} = \phi f_y \times Z_{ey}\)

\[
M_{sy} = 250 \times 3.114 \times 10^6 = 778.5 \text{ kN m}
\]

\[
\phi M_{sy} = 0.9 \times 778.5 = 700.7 \text{ kN m}
\]

Member Bending Capacity

End restraint arrangement = LL

A twist restraint factor, \(K_t (SKT) = 1.00\)

Minor axis rotation restraints = Both

Lateral rotation restraint factor, \(K_r (SKR) = 1.0\)

Load Height factor, \(K_l (LHT) = 1.00 \) [Ref: Table 5.6.3(2)]

Effective length = 1\(\times\)1\(\times\)1\(\times\)6,000 = 6,000 mm

\[
\alpha_m = 1
\]

[Ref: Cl no -5.6.1.1 (b)]

Reference buckling moment, \(M_o\)

\[
M_o = \left(\frac{\mu^2 EI_y}{L e^2} GJ + \frac{\mu^2 EI_{tw}}{L e^2}\right) = 41,334 \text{ kN m}
\]

\[
\alpha_s = 1
\]

[Ref : Clause 5.6.1.1 (c)]

\[
M_{bx} = \alpha_m \alpha_s M_{sx} \leq M_{sx}
\]
\[ M_{bz} = 1 \times 1 \times 1,106 = 1,106 \text{ kN m} \leq (M_{sz}, M_{sy})_{\text{Max.}} \] [Ref : Clause 5.6.1.1.1(a)]

\[ \phi M_{bz} = 0.9 \times 1,106 = 995.6 \text{ kN m} \]

Check for Axial Compression

Section Compression Capacity:

Gross Area, \( A_g = 26,774 \text{ mm}^2 \)

Net Area, \( A_n = 26,774 \text{ mm}^2 \)

Form factor, \( K_f = A_e / A_g = 1.0 \)

The nominal member section capacity for axial compression,

\[ N_s = K_f \times A_n \times f_y = 1.0 \times 26,774 \times 250 = 6,694 \text{ kN} \] [Ref : Clause 6.2.1]

\[ \phi N_s = 0.9 \times 6,694 = 6,024 \text{ kN} \]

Member Compression Capacity

Length of the member, \( L = 6,000 \text{ mm} \)

Effective length factor for slenderness & buckling about minor Y- axis, \( K_y = 1.0 \)

Effective length factor for slenderness & buckling about minor Z- axis, \( K_z = 1.0 \)

Effective Length of member, \( L_{ez} = 1.0 \times 6,000 \text{ mm} = 6,000 \text{ mm} \)

Effective Length of member, \( L_{ey} = 1.0 \times 6,000 \text{ mm} = 6,000 \text{ mm} \)

\[ r_z = \sqrt{(911.5 \times 10^6 / 26,774)} = 184.5 \]

\[ r_y = \sqrt{411.2 \times 10^6 / 26,774} = 123.9 \]

Geometrical Slenderness Ratio = \( L_{ez} / r_z = 6,000 / 184.5 = 32.5 \)

Geometrical Slenderness Ratio = \( L_{ey} / r_y = 6,000 / 123.9 = 48.4 \)

Member slenderness,

\[ \lambda_{nz} = \frac{L_{ez}}{r} \sqrt{K_f} \sqrt{\frac{f_y}{250}} = 32.5 \sqrt{1} \sqrt{\frac{250}{250}} = 32.5 \] [Ref : Clause 6.3.3]

\[ \lambda_{ny} = \frac{L_{ey}}{r} \sqrt{K_f} \sqrt{\frac{f_y}{250}} = 48.4 \sqrt{1} \sqrt{\frac{250}{250}} = 48.4 \] [Ref : Clause 6.3.3]

\[ a_{az} = 2,100 \times (\lambda_{nz} - 13.5) / (\lambda_{nz}^2 - 15.3 \lambda_{nz} + 2,050) = 15.30 \]

\[ a_{ay} = 2,100 \times (\lambda_{ny} - 13.5) / (\lambda_{ny}^2 - 15.3 \lambda_{ny} + 2,050) = 20.07 \]

\[ a_b = 1.0 \]

\[ \lambda_z = \lambda_{nz} + a_{az} \times a_z = 17.22 \]

\[ \lambda_y = \lambda_{ny} + a_{ay} \times a_b = 28.34 \]

\[ \eta = 0.012 \]

\[ \eta = 0.048 \]

\[ \xi_{sz} = (\lambda_{sz} / 90)^2 + 1 + \eta / (2 \times (\lambda_{sz} / 90)^2) = 14.33 \]

\[ \xi_{sy} = (\lambda_{sy} / 90)^2 + 1 + \eta / (2 \times (\lambda_{sy} / 90)^2) = 5.785 \]

\[ a_{cz} = 0.988 \] [Ref : Table 6.3.3(2)]
\( \alpha_{cy} = 0.949 \)

The nominal member capacity,
\[ N_{cz} = \alpha_{cz} \times N_s = 0.988 \times 6,694 = 6,611 \text{ kN} \]  
\[ \phi N_{cz} = 5,950 \text{ kN} \]  

The nominal member capacity,
\[ N_{cy} = \alpha_{cy} \times N_s = 0.949 \times 6,694 = 6,353 \text{ kN} \]  
\[ \phi N_{cy} = 5,717 \text{ kN} \]

**Nominal Section tension Capacity**

[Ref : Clause 7.1]

\[ K_{te} = 1.00 \]
\[ N_{t1} = A_g \times f_y = 6,024 \text{ kN} \]
\[ N_{t2} = 0.85 \times K_{te} \times A_n \times f_u = 6,694 \text{ kN} \]
\[ \phi N_{t} = 0.9 \times 6,694 = 6,024 \text{ kN} \]  
[Ref : Clause 5.6.1.1.1(a)]

MEMBER DESIGN OUTPUT FOR PMEMBER 2

DESIGN Notes

1. (*) next to a Load Case number signifies that a P-Delta analysis has not been performed for that particular Load Case; i.e. analysis does not include second-order effects.
2. $\phi = 0.9$ for all the calculations [NZS3404 Table 3.4]
3. (#) next to Young's modulus $E$ indicates that its value is not 200000 MPa as per NZS3404 1.4.

DESIGN SUMMARY

Designation: ST HSST20X12X.75 (AISC SECTIONS)

Governing Load Case: 1*

Governing Criteria: Cl. 8.4.4.1

Governing Ratio: 0.090 (PASS)

Governing Location: 0.000 m from Start.

V.NZS3404 1997-Simply Supported Beam With Overhang
Verify the design strength of an I section per the NZS3404 1997 code.

Reference

Related Links
- D11.A.5.1 Analytical Member Design (on page 1757)

Details
From the reference:
The 250UC89.5 beam in Grade 300 steel shown below is continuous over the supports at B and D and is free at A and E. The beam section is restrained against lateral deflection at B and D, fully restrained against twist rotation at B and D, and is unrestrained at A and E. A downward concentrated load of 5P* acts at C and a downward concentrated load of P* acts at A and E. These loads act at the top flange, and are free to deflect laterally with the beam. Determine the maximum value of P*.

Validation
Section Classification
Evaluate the slenderness effects of the flange:
\[ \lambda_{ef} = \frac{B}{2t_f} \sqrt{\frac{f_y}{250}} = \frac{256}{2(17.3)} \sqrt{\frac{280}{250}} = 7.83 \]
Section classification of the flange is compact.
Evaluate the slenderness effects of the web:
\[ \lambda_{ew} = \frac{d}{t_w} \sqrt{\frac{f_y}{250}} = \frac{225.4}{10.5} \sqrt{\frac{280}{250}} = 22.72 \]
Section classification of the web is compact
Section Bending Capacity About Z-Axis
Effective Section Modulus, \( Z_{ez} = 1.23 \times 10^6 \ mm^3 \)
The nominal section capacity in bending about Z axis, \( M_{sz} = \phi f_y Z_{ez} \)

\[
M_{sz} = 280 \times 1.23 \times 10^{-6} = 344.4 \text{ kN} \cdot \text{m}
\]

\[
\phi M_{sz} = 0.9 \times 344.4 = 309.96 \text{ kN} \cdot \text{m}
\]

**Section Bending Capacity About Y-Axis**

Effective Section Modulus, \( Z_{ey} = 575 \times 10^3 \text{ mm}^3 \)

The nominal section capacity in bending about Z axis, \( M_{sy} = \phi f_y Z_{ey} \)

\[
M_{sy} = 280 \times 575 \times 10^{-3} = 161 \text{ kN} \cdot \text{m}
\]

\[
\phi M_{sy} = 0.9 \times 161 = 144.9 \text{ kN} \cdot \text{m}
\]

**Member Bending Capacity of Cantilevers**

End restraint arrangement = FU

A twist restraint factor, \( K_t \) (SKT) = 1.00

Minor axis rotation restraints = Both

Lateral rotation restraint factor, \( K_r \) (SKR) = 1.0

Load Height factor, \( K_l \) (LHT) = 2 [Ref: Table 5.6.3(2)]

Effective length = \( 1 \times 1 \times 2 \times 4,000 = 8,000 \text{ mm} \)

The alpha value for a cantilever is taken from Table 5.6.2 in the code.

\[
\alpha_m = 1.25 \quad \text{[Ref. Table 5.6.2]}
\]

Reference buckling moment, \( M_o \)

\[
M_o = \sqrt{\frac{n^2EI_y}{L^2} \left[ GJ + \frac{n^2EI_w}{L^2} \right]}
\]

\[
M_o = \sqrt{\frac{205 \times (4.84 \times 10^6)}{(8,000)^2} \left[ 1.04 \times 10^6 + \frac{205 \times (713 \times 10^9)}{(8,000)^2} \right] 10^{-3}} = 399 \text{ kN} \cdot \text{m}
\]

\[
\alpha_s = 0.6 \left( \frac{M_{sx}}{M_{oa}} \right)^2 + \frac{1}{3} \cdot \frac{M_{sx}}{M_{oa}} \quad \text{[Ref: Clause 5.6.1.1 (c)]}
\]

\[
\alpha_s = 0.6 \left( \frac{344.4}{399} \right)^2 + \frac{1}{3} \cdot \frac{344.4}{399} = 0.643
\]

\[
M_{bx} = \alpha_m \alpha_s M_{sx} \leq M_{sx}
\]

\[
M_{bx} = 1.25 \times 0.643 \times 344.4 = 276.8 \text{ kN} \cdot \text{m} \leq (M_{sz}, M_{sy})_{\text{Max.}} \quad \text{[Ref: Clause 5.6.1.1.1(a)]}
\]

\[
\phi M_{bz} = 0.9 \times 276.8 = 249.1 \text{ kN} \cdot \text{m}
\]

**Member Bending Capacity of Main Span**

End restraint arrangement = FF

A twist restraint factor, \( K_t \) (SKT) = 1.00

Minor axis rotation restraints = Both

Lateral rotation restraint factor, \( K_r \) (SKR) = 1.0

Load Height factor, \( K_l \) (LHT) = 1.4 [Ref: Table 5.6.3(2)]
Effective length = 1x1x1.4x8,000 = 11,200 mm

\[ \alpha_m = \frac{1.7 \times M_m}{\sqrt{(M_1^*)^2 + (M_2^*)^2 + (M_3^*)^2}} \leq 2.5 \]

\[ \alpha_m = \frac{1.7 \times 6P^*}{\sqrt{(6P^*)^2 + (P^*)^2}} = 1.655 \]

Reference buckling moment, \( M_o \)

\[ M_o = \sqrt{\frac{n^2 EI_y}{L_e^2} GJ + \frac{n^2 EI_w}{L_e^2}} \]

\[ M_o = \sqrt{\frac{n^2 E (205)(4.84 \times 10^6)}{(11,200)^2} \left[ 80 \left( \frac{1.04 \times 10^6}{(11,200)^2} \right) + \frac{n^2 E (205)(713 \times 10^9)}{(11,200)^2} \right]} \times 10^{-3} = 271.9 \text{ kN m} \]

\[ \alpha_s = 0.6 \left\{ \left( \frac{M_{sx}}{M_{oa}} \right)^2 + 3 \right\} \left( \frac{M_{sx}}{M_{oa}} \right) \]

\[ \alpha_s = 0.6 \left( \frac{344.4}{271.9} \right)^2 + 3 \left( \frac{344.4}{271.9} \right) = 0.528 \] \[ \text{[Ref : Clause 5.6.1.1 (c)]} \]

\( M_{bx} = \alpha_m \alpha_s M_{sx} \leq M_{sx} \)

\( M_{bx} = 1.655 \times 0.528 \times 344.4 = 300.95 \text{ kN m} \leq (M_{sz}, M_{sy})_{\text{Max.}} \] \[ \text{[Ref : Clause 5.6.1.1.1(a)]} \]

\( \phi M_{bz} = 0.9 \times 300.95 = 270.9 \text{ kN m} \)

Maximum Load Determination

The moments over the supports due to the cantilevers, \( M_1 = M_2 = 4 \times P^* \)

The maximum moment in the middle span occurs at the 5P load:

\[ M_{max} = \frac{(5P^*)^8}{4} \cdot (M_1 + M_2) = 10P^* \cdot 4P^* = 6P^* \]

So the maximum value of \( P^* \) is derived from setting \( M_{max} = \phi M_{bz} \) and solving for \( P^* \):

\[ P^* = \phi M_{bz} / 6 = 270.9 / 6 = 45.1 \text{ kN} \]

</tbody>
</table>
The reference gives a $P^*$ value of 44.33 kN (though to be noted this is also calculated for the AS 4100 code as opposed to the NZS 3404 1997 code).

†For STAAD.Pro, the value of 44.9 kips gives a critical ratio of 1.00 for the member bending capacity.

Section Combined Capacity (Biaxial)
V.NZS3404 1997-Tube Section Compact

Verify the design capacity of a PIPX80 section per the NZS3404 1997 code.

Details

Verify the bending capacity of a PIPX80 member. Steel grade = 250 MPa. The simply supported span is 9 m with a 8.4 kN load at 5 m from the left support.

Validation

Section Classification

Evaluate the slenderness effects of the pipe member:

\[ \lambda_{ew} = \frac{OD}{t} \sqrt{\frac{1}{T_y}} = \frac{219.1}{11.8} \sqrt{\frac{250}{250}} = 18.3 \]

Section classification is compact

Section Bending Capacity About Z-Axis

Effective Section Modulus, \( Z_{ez} = 508 \times 10^3 \text{ mm}^3 \)
The nominal section capacity in bending about Z axis, \( M_{sz} = \phi f_y Z_{ez} \)

\[
M_{sz} = 250 \times 508 \times 10^3 / 10^6 = 127 \text{ kN} \cdot \text{m}
\]

\[
\phi M_{sz} = 0.9 \times 127 = 114.3 \text{ kN} \cdot \text{m}
\]

The pipe is symmetric, thus \( \phi M_{sy} = \phi M_{sz} \)

Member Bending Capacity

End restraint arrangement = LL

A twist restraint factor, \( K_t \) (SKT) = 1.00

Minor axis rotation restraints = Both

Lateral rotation restraint factor, \( K_r \) (SKR) = 1.0

Load Height factor, \( K_l \) (LHT) = 1.00 \([Ref: Table 5.6.3(2)]\)

Effective length = 1×1×1×9,000 = 9,000 mm

\[
\alpha_m = 1
\]

[Ref: Cl no -5.6.1.1 (b)]

Reference buckling moment, \( M_o \)

\[
M_o = \sqrt{\left( \frac{n^2 EI}{L e^2} \left[ GJ + \left( \frac{n^2 EI w}{L e^2} \right) \right] \right)^2} = 2,641 \text{ kN} \cdot \text{m}
\]

\[
\alpha_s = 1
\]

[Ref: Clause 5.6.1.1 (c)]

\[
M_{bx} = \alpha_m \alpha_s M_{sx} \leq M_{sx}
\]

\[
M_{bx} = 1 \times 1 \times 127 = 127 \text{ kN} \cdot \text{m} \leq (M_{sz}, M_{sy})_{\text{Max}}
\]

[Ref: Clause 5.6.1.1.1(a)]

\[
\phi M_{bx} = 0.9 \times 127 = 114.3 \text{ kN} \cdot \text{m}
\]

Check for Shear

Section Shear Capacity (Along Y axis), \( V_y = 0.36 \times f_y \times A_g = 0.36 \times 250 \times 7,677 = 691 \text{ kN} \)

\[
\phi V_y = 0.9 \times 691 = 622 \text{ kN}
\]

The pipe is symmetric, thus \( \phi V_z = \phi V_y \)

Check for Axial Compression

Section Compression Capacity:

Gross Area, \( A_g = 7,677 \text{ mm}^2 \)

Net Area, \( A_n = \text{Net Area} \)

Form factor, \( K_f = A_s / A_g = 1.0 \)

The nominal member section capacity for axial compression,

\[
N_s = K_f \times A_n \times f_y = 1.0 \times 7,677 \times 250 = 1,919 \text{ kN}
\]

[Ref: Clause 6.2.1]

\[
\phi N_s = 0.9 \times 1,919 = 1,727 \text{ kN}
\]

Member Compression Capacity

Length of the member, \( L = 9,000 \text{ mm} \)

Effective length factor for slenderness & buckling about minor Y- axis, \( K_y = 1.0 \)

Effective length factor for slenderness & buckling about minor Z- axis, \( K_z = 1.0 \)
Effective Length of member, \( L_{ez} = 1.0 \times 9,000 \text{ mm} = 9,000 \text{ mm} \)

Effective Length of member, \( L_{ey} = 1.0 \times 9,000 \text{ mm} = 9,000 \text{ mm} \)

\[ r_y = r_z = \sqrt{(41.62 \times 10^6 / 7,677)} = 73.63 \]

Geometrical Slenderness Ratio \( = \frac{L_{ey}}{r_y} = \frac{L_{ez}}{r_z} = 9,000 / 73.63 = 122.2 \)

Member slenderness,

\[ \lambda_n = \frac{L_e}{r} \sqrt{\frac{f_y}{250}} = 122.2 \sqrt{\frac{250}{250}} = 122.2 \]  

[Ref : Clause 6.3.3]

\[ \alpha_a = 2,100 \times (\lambda_n - 13.5)/(\lambda_n^2 - 15.3\lambda_n + 2,050) = 15.10 \]

\[ \alpha_b = -1.0 \]  

[Ref : Table 6.3.3(2)]

\[ \lambda = \lambda_n + \alpha_a \times \alpha_b = 107.1 \]

\[ \eta = 0.3 \]

\[ \xi_y = \xi_z = ((\lambda_z/90)^2 + 1 + \eta)/(2(\lambda_z/90)^2) = 1 \]

\[ \alpha_{cy} = \alpha_{cz} = 0.495 \]

The nominal member capacity,

\[ N_{cy} = N_{cz} = \alpha_{cz} \times N_s = 0.495 \times 1,919 = 950 \text{ kN} \]  

[Ref : Clause 6.3.3]

\[ \phi N_{cy} = \phi N_{cz} = 855 \text{ kN} \]

Nominal Section tension Capacity

[Ref : Clause 7.1]

\[ K_{te} = 1.00 \]

\[ N_{t1} = A_g \times f_y = 7,677 \times 250 \times 10^{-3} = 1,919 \text{ kN} \]

\[ N_{t2} = 0.85 \times K_{te} \times A_n \times f_u = 0.85(1.0)(7,677)(250 \times 10^{-3}) = 1,631 \text{ kN} \]

\[ \phi N_t = 0.9 \times 1,919 = 1,727 \text{ kN} \]  

[Ref : Clause 5.6.1.1.1(a)]

DESIGN Notes
-----------
1. (*) next to a Load Case number signifies that a P-Delta analysis has not been performed for that particular Load Case; i.e. analysis does not include second-order effects.
2. ϕ = 0.9 for all the calculations [NZS3404 Table 3.4]
3. (#) next to Young’s modulus E indicates that its value is not 200000 MPa as per NZS3404 1.4.

V.NZS3404 1997-Tube Section Non Compact
Verify the design capacity of a pipe section per the NZS3404 1997 code.
Details
Verify the capacity of a PIP3239H member. Steel grade = 250 MPa. The simply supported span is 9 m with a 60 kN load at mid-span.

Validation
Section Classification
Evaluate the slenderness effects of the pipe member:
\[
\lambda_{ef} = \frac{OD}{t} \sqrt{\frac{f_y}{250}} = \frac{323.9}{6.3} \sqrt{\frac{250}{250}} = 51.41
\]
Section classification is non-compact (\(\lambda_{cy} = 120 > \lambda_{ef} > \lambda_{ep} = 50\))

Section Bending Capacity About Z-Axis
Effective section modulus for a compact section:
\[
S_{xx} = 636 \times 10^3 \text{mm}^3 \cdot 1.5 \times Z_{xx} = 1.5(489.6 \times 10^3) \text{mm}^3 = 734.4 \times 10^3 \text{mm}^3
\]
Effective section modulus for a non-compact section:
\[
Z_e = Z + \frac{\lambda_{ey} - \lambda_{ef}}{\lambda_{ey} - \lambda_{ep}}(Z_c - Z_{xx}) = 489.6 + \frac{120 - 51.41}{120 - 50}(636 - 489.6) = 633.1 \times 10^3 \text{mm}^3
\]
The nominal section capacity in bending about Z axis, \(\phi M_s = \phi f_y \times Z_e\)
\[
M_s = 250 \times 633.1 \times 10^3 / 10^6 = 158.3 \text{kN} \cdot \text{m}
\]
\(\phi M_{sz} = 0.9 \times 158.3 = 142.4 \text{kN} \cdot \text{m}\)

Member Bending Capacity
End restraint arrangement = LL
A twist restraint factor, \(K_t \text{ (SKT)} = 1.00\)
Minor axis rotation restraints = Both
Lateral rotation restraint factor, \(K_r \text{ (SKR)} = 1.0\)
Load Height factor, \(K_l \text{ (LHT)} = 1.00 \text{ [Ref: Table 5.6.3(2)]}\)
Effective length = 1\times1\times9,000 = 9,000 mm
\[
\alpha_m = 1 \quad \text{[Ref: Cl no -5.6.1.1 (b)]}
\]
Reference buckling moment, \(M_0\)
\[
M_0 = \left(\frac{n^2 EI_z}{L^2 e^2} \left[ \frac{GJ}{G} + \frac{n^2 EI_w}{L^2 e^2} \right] \right) = \left(\frac{n^2 \times 250 \times 10^3 \times 79.29 \times 10^6}{9,000^2} \left[ 80,000 \times 158.58 \times 10^6 + \left(\frac{n^2 \times 250 \times 10^3 \times 79.29 \times 10^6}{9,000^2} \right) \right] \right) = 5,013 \text{kN} \cdot \text{m}
\]
\[
\alpha_s = 1 \quad \text{[Ref: Clause 5.6.1.1 (c)]}
\]
Member bending capacity, \(M_{bz}\)
\[ M_{bz} = \alpha_m \alpha_s M_{sz} \leq M_{sz} \]
\[ M_{bz} = 1 \times 1 \times 158.2 = 158.3 \text{kN} \cdot \text{m} \leq (M_{sz}, M_{sy})_{\text{Max.}} \]
\[ \phi M_{bz} = 0.9 \times 158.3 = 142.4 \text{kN} \cdot \text{m} \]

**Check for Shear**

Nominal shear capacity, \( V_y \), of a circular hollow section: [Ref. Cl no 5.11.4.2]

\[ V_y = 0.36 \times f_y \times A_e = 0.36 \times 250 \times 6,290 \times 10^{-3} = 566.1 \text{kN} \]
\[ \phi V_y = 0.9 \times 566.1 = 509.5 \text{kN} \]

Nominal shear capacity, \( V_y \), of a circular hollow section: [Ref. Cl no 5.12.2]

Design bending moment, \( M = 135 \text{kN} \cdot \text{m} \)

\[ 0.75 \times \phi \times M_s \leq M \leq \phi \times M_s \]
\[ 0.75 \times 142.4 = 106.8 \text{kN} \cdot \text{m} \]
\[ V_y = V_y \left[ 2.2 \cdot \left( \frac{1.6 \times M}{\phi M_s} \right) \right] = 566.1 \times \left[ 2.2 \cdot \left( \frac{1.6 \times 135}{142.4} \right) \right] = 386.9 \text{kN} \]
\[ \phi V_y = 0.9 \times 386.9 = 348.3 \text{kN} \]

**Check for Axial Capacity**

Section Compression Capacity:

Gross Area, \( A_g = 6,290 \text{mm}^2 \)

The effective outside diameter is the minimum of \( d_{e1}, d_{e2}, \) and \( d_o \):

\[ d_{e1} = d_o \sqrt{\frac{\lambda_{ey}}{\lambda_e}} = 409.1 \text{mm} \]
\[ d_{e2} = d_o \left( \frac{3 \times \lambda_{ey}}{\lambda_e} \right)^2 = 7,415 \text{mm} \]

The effective outside diameter = \( d_o = 323.9 \text{mm} \)

Net Area, \( A_n = 6,290 \text{mm}^2 \)

Form factor, \( K_f = A_v/A_g = 1.0 \)

The nominal member section capacity for axial compression,

\[ N_s = K_f \times A_n \times f_y = 1.0 \times 6,290 \times 250 = 1,573 \text{kN} \]
\[ \phi N_s = 0.9 \times 1,573 = 1,415 \text{kN} \]

**Member Compression Capacity**

Length of the member, \( L = 9,000 \text{mm} \)

Effective length factor for slenderness & buckling about minor Y- axis, \( K_y = 1.0 \)

Effective length factor for slenderness & buckling about minor Z- axis, \( K_z = 1.0 \)

Effective Length of member, \( L_{e2} = 1.0 \times 9,000 \text{mm} = 9,000 \text{mm} \)

Effective Length of member, \( L_{ey} = 1.0 \times 9,000 \text{mm} = 9,000 \text{mm} \)

\[ r_y = r_z = \sqrt{79.29 \times 10^6 / 6,290} = 112.3 \text{mm} \]
Geometrical Slenderness Ratio = \( \frac{L_{ey}}{r_y} = \frac{L_{ez}}{r_z} = \frac{9,000}{112.3} = 80.13 \)

Member slenderness, \( \lambda_n = \frac{L_{ef}}{r_f} \sqrt{\frac{f_y}{250}} = 80.13 \sqrt{\frac{250}{250}} = 80.13 \)  

\[ \alpha_a = 2 \times 100 \times \left( \frac{\lambda_{nz} - 13.5}{\lambda_{nz}^2 - 15.3 \lambda_{nz} + 2,050} \right) = 19.31 \]

\( \alpha_b = -0.5 \)  
\( \alpha_a \times \alpha_b = 70.48 \)
\( \eta = 0.19 \)
\( \xi_y = \xi_z = \left[ 1 + \sqrt{1 - \left( \frac{90}{\xi_y \times \xi_z} \right)^2} \right] = 0.74 \)

The nominal member capacity, \( N_{cy} = \alpha_{cz} \times N_s = 0.74 \times 1,573 = 1,171 \text{ kN} \)
\( \phi N_{cy} = \phi N_{cz} = 1,054 \text{ kN} \)

**Nominal Section tension Capacity**

\( K_{te} = 1.00 \)
\( N_{l1} = A_g \times f_y = 6,290 \times 250 \times 10^{-3} = 1,573 \text{ kN} \)
\( N_{l2} = 0.85 \times K_{te} \times A_n \times f_u = 0.85(1.0)(6,290)(250 \times 10^{-3}) = 1,711 \text{ kN} \)
\( \phi N_t = 0.9 \times 1,573 = 1,415 \text{ kN} \)

*SEISMIC PROVISIONS*

**Section Slenderness (Bending about Z-axis)**
Critical Load Case: 1*
Critical Ratio: 0.791
Critical Location: 0.000 m from Start.
\[ \lambda_{sz} = 51.41 \quad \text{[NZS3404 12.5.1.1]} \]
\[ \lambda_{ez} = 65.00 \quad \text{[NZS3404 Table 12.5]} \]

**Section Slenderness (Bending about Y-axis)**
Critical Load Case: 1*
Critical Ratio: 0.791
Critical Location: 0.000 m from Start.
\[ \lambda_{sy} = 51.41 \quad \text{[NZS3404 12.5.1.1]} \]
\[ \lambda_{ey} = 65.00 \quad \text{[NZS3404 Table 12.5]} \]

**Max Specific Yield Stress**
Critical Load Case: 1*
Critical Ratio: 0.694
Critical Location: 0.000 m from Start.
\[ F_{y,\text{actual}} = 250.00 \]
\[ F_{y,\text{limit}} = 360.00 \quad \text{[NZS3404 Table 12.4(1)]} \]

**Max Actual Yield Ratio (Fy/Fu)**
Critical Load Case: 1*
Critical Ratio: 0.977
Critical Location: 0.000 m from Start.
\[ F_{y/Fu,\text{actual}} = 0.78 \]
\[ F_{y/Fu,\text{limit}} = 0.80 \quad \text{[NZS3404 Table 12.4(3)]} \]

**Fabrication Requirement**
Critical Load Case: N/A
Critical Ratio: N/A
Critical Location: N/A
Status = Passed \quad \text{[NZS3404 12.4.1.2]} \]

**Section Symmetry Requirement**
Critical Load Case: N/A
Critical Ratio: N/A
Critical Location: N/A
Status = Passed \quad \text{[NZS3404 12.5.2]} \]

**Min Web Thickness Requirement for Beam**
Critical Load Case: 1*
Critical Ratio: 0.489
Critical Location: 0.000 m from Start.
\[ t_{w,\text{actual}} = 6.30 \]
\[ t_{w,\text{min}} = 3.08 \quad \text{[NZS3404 12.7.2]} \]

**Max Axial Force Limit for Column (a)**
Critical Load Case: 1*
Critical Ratio: 0.000
Critical Location: 0.000 m from Start.
\[ N*/\varphi N_s - \text{actual} = 0.00 \]
\[ N*/\varphi N_s - \text{limit} = 0.80 \quad \text{[NZS3404 Table 12.8.1]} \]

**Max Axial Force Limit for Column (b)**
Critical Load Case: 1*
Critical Ratio: 0.000
Critical Location: 0.000 m from Start.
\[ b_m = 0.00 \]
\[ N_{OL} = 1.9806E+03 \text{ KN} \]
\[ \lambda_{EYC} = 0.89 \]
Verification Examples

V. NZS3404 1997-UB Section

Verify the Design Capacity of I Section as per NZS3404 1997.

Details

Verify the section bending capacity of an UB530X92.4. The member is used in a 15 m simply supported span.

Validation

Section Classification

Evaluate the slenderness the beam flanges:

\[ \lambda_{ef} = \frac{B}{2t_f} \times \sqrt{\left(\frac{f_y}{250}\right)} = 198.8/(2 \times 15.60) \times \sqrt{\left(\frac{300}{250}\right)} = 6.98 < 8 \]

Flange is compact.

Evaluate the slenderness of the beam web:

\[ \lambda_{ew} = \frac{d}{t_w} \times \sqrt{\left(\frac{f_y}{250}\right)} = 501.80/10.20 \times \sqrt{\left(\frac{300}{250}\right)} = 53.89 < 89 \]

Web is compact.

Bending Capacity

Section Bending Capacity About Strong Axis

Effective section modulus, \( Z_{ez} = 2.37(10)^6 \, mm^3 \)

The nominal section capacity in bending about the Z axis, \( M_{ez} = f_y \times Z_{ez} \)
\[ M_{sz} = 0.9 \times 300 \times 2.37 = 639.9 \text{ kN} \cdot \text{m} \]

**Section Bending Capacity About Weak Axis**

Effective section modulus, \( Z_{ey} = 341.6(10)^3 \text{ mm}^3 \)

The nominal section capacity in bending about the Y axis, \( M_{sy} = \phi f_y \times Z_{ey} \)

\[ M_{sy} = 0.9 \times 300 \times 341.6 \times (10)^{-3} = 92.24 \text{ kN} \cdot \text{m} \]

**Member Bending Capacity**

End restraint arrangement = FF

A twist restraint factor, \( K_{f(SKT)} = 1.00 \)

Minor axis rotation restraints = Both

Lateral rotation restraint factor, \( K_{r(SKR)} = 1 \)

Load Height factor, \( K_{p(LHT)} = 1.00 \) (Table 5.6.3(2) of NZS3404:1997)

Effective length = \( 1 \times 1 \times 1 \times 15,000 = 15,000 \text{ mm} \)

Design Bending Moment, \( M_m = 160.8 \text{ kN} \cdot \text{m} \)

Quarter Point Moment of segment, \( M_2 = -72.443 \text{ kN} \cdot \text{m} \)

Mid-Point Moment of segment, \( M_3 = -2.267 \text{ kN} \cdot \text{m} \)

Quarter Point Moment of segment, \( M_4 = 72.499 \text{ kN} \cdot \text{m} \)

\[
\alpha_m = \frac{1.7 M_m^3}{\sqrt{\left(M_1^2 + M_2^2 + M_3^2\right)^2}} \leq 2.5
\]

\[
\alpha_m = \frac{1.7 \times 160.8}{\sqrt{(-72.44)^2 + (-2.267)^2 + (72.5)^2}} = 2.66
\]

Therefore, \( \alpha_m = 2.5 \)

Reference Buckling Moment, \( M_o \)

\[
M_o = \sqrt{\left(\frac{n^2 E I_y}{L e^2}\right) G J + \left(\frac{n^2 E I_y}{L e^2}\right)} = 127.0 \text{ kN} \cdot \text{m}
\]

\[
\alpha_s = 0.6 \left[\left(\frac{M_{sx}}{M_{og}}\right)^2 + 3\right] \left(\frac{M_{sx}}{M_{og}}\right) = 0.157
\]

\[
M_{bz} = \alpha_m \alpha_s M_{sx} \leq M_{sx} = 2.5 \times 0.157 \times 71 = 279.1 \text{ kN} \cdot \text{m}
\]

\[
\phi M_{bz} = 251.2 \text{ kN} \cdot \text{m}
\]

**Check for Shear**

Shear Area of the section, \( A_y = d \times t_w = 533.0 \times 10.2 = 5,436.6 \text{ mm}^2 \)

Section Shear Capacity (Along Y axis), \( V_y = 0.6 \times f_y \times A_y = 0.6 \times 320 \times 5,436.6 = 1,044 \text{ kN} \)

\[
Z V_y = 0.9 \times 1,044 = 939.4 \text{ kN}
\]

Shear Area of the section, \( A_Z = 2 \times b_f \times t_f = 2 \times 209 \times 15.6 = 6,520.8 \text{ mm}^2 \)

Section Shear Capacity (Along z axis), \( V_Z = 0.6 \times f_y \times A_Z = 0.6 \times 300 \times 6,520.8 = 1,174 \text{ kN} \)
ϕVz = 1,056 kN

**Check for Axial Compression**

**Section Compression Capacity**

The flange slenderness, \( \lambda_{eb} = 6.98 \) [Ref : Cl no - 6.2.3.1]
Yield slenderness for flange, \( \lambda_{eby} = 16.00 \) [Ref : Table 6.2.4]

The web slenderness, \( \lambda_{ew} = 55.66 \)
Yield slenderness for web, \( \lambda_{ebw} = 45 \)

Effective Width, \( b_e = 209 \text{ mm} \)
Effective Depth, \( DE = 405.7 \text{ mm} \)

Gross Area, \( A_g = 11,800 \text{ mm}^2 \)
Net Area, \( A_n = 10,820 \text{ mm}^2 \)

Form factor, \( K_f = A_e / A_g = 0.917 \)

The nominal member section capacity for axial compression, \( N_s = K_f \times A_n \times f_y = 0.917 \times 10,819.8 \times 300 = 3,246 \text{ kN} \) [Ref : Cl no - 6.2.1]

\[ \phi N_s = 0.9 \times 3,246 = 2,920 \text{ kN} \] [Ref : Cl no - 6.2.1]

**Member Compression Capacity**

Effective length factor for slenderness & buckling about minor Y- axis, \( K_y = 1.00 \)
Effective length factor for slenderness & buckling about minor Z- axis, \( K_z = 1.00 \)

Effective Length of member, \( L_{ez} = 15,000 \text{ mm} \)
Effective Length of member, \( L_{ey} = 15,000 \text{ mm} \)

Geometrical Slenderness Ratio = 69.23

Geometrical Slenderness Ratio = 334.0

Member slenderness, \( \lambda_{nz} = (L_e / r) \times \sqrt{(k_f) \times \sqrt{(f_y / 250)}} \) [Ref : Cl no - 6.3.3.]
\[ \lambda_{nz} = 69.23 \times \sqrt{1} \times \sqrt{(300/250)} = 72.62 \]

Member slenderness, \( \lambda_{ny} = (L_{ey} / r) \times \sqrt{(k_f) \times \sqrt{(f_y / 250)}} \) [Ref : Cl no - 6.3.3.]
\[ \lambda_{ny} = 334 \times \sqrt{1} \times \sqrt{(300/250)} = 350.35 \]

\( \alpha_{nz} = 2,100 \times (\lambda_{nz} \cdot 13.5) / (\lambda_{nz}^2 - 15.3 \lambda_{nz} + 2,050) = 19.984 \)
\( \alpha_{ny} = 2,100 \times (\lambda_{ny} \cdot 13.5) / (\lambda_{ny}^2 - 15.3 \lambda_{ny} + 2,050) = 5.923 \)
\( \alpha_b = 0.00 \) [Ref : table 6.3.3(2)]

\( \lambda_z = \lambda_{nz} + \alpha_{nz} \alpha_b = 72.62 \)
\( \lambda_y = \lambda_{ny} + \alpha_{ny} \alpha_b = 350.35 \)
\( \eta = 0.19 \)
\( \eta = 1.10 \)
\( \xi = ((\lambda_{e90})^2 + 1 + \eta) / (2 \times (\lambda_{e90})^2) = 1.42 \)
\[ \xi_y = \frac{(\lambda_y/90)^2 + 1 + \eta}{2 \times (\lambda_y/90)^2} = 0.57 \]
\[ \alpha_{cz} = 0.731 \]  
[Ref : Cl no - 6.3.3]
\[ \alpha_{cy} = 0.061 \]  
[Ref : Cl no - 6.3.3]

The nominal member capacity, \( N_{cz} = \alpha_{cz} \times N_s \) [Ref : Cl no - 6.3.3]
\[ N_{cz} = \alpha_{cz} \times N_s = 0.731 \times 3,246 = 2,373 \text{ kN} \]
\[ \phi_{Ncz} = 2,136 \text{ kN} \]

The nominal member capacity, \( N_{cy} = \alpha_{cy} \times N_s \) [Ref : Cl no - 6.3.3]
\[ N_{cy} = \alpha_{cy} \times N_s = 0.061 \times 3,246 = 198.9 \text{ kN} \]
\[ \phi_{Ncy} = 178.96 \text{ KN} \]

### Nominal Section Tension Capacity

Ref. Cl 7.1
\[ K_{te} = 1.00 \]
\[ N_{t1} = A_g \times f_y = 3,540 \text{ kN} \]
\[ N_{t2} = 0.85 \times K_{te} \times A_n \times f_u = 4,413 \text{ kN} \]
\[ \phi_{Nt} = 3,186 \text{ kN} \] [Ref : Cl no - 5.6.1.1.1(a)]

axis notation for any section other than st angle:-

STAAD.Pro NZS3404 Spec. Description
--------- ------------- -----------
X/x Z/z Longitudinal axis of section
Y/y Y/y Minor principal axis of section
Z/z X/x Major principal axis of section

Member design output for pmember 5

--- design notes

1. (*) next to a load case number signifies that a p-delta analysis has not been performed for that particular load case; i.e. analysis does not include second-order effects.

2. $\phi = 0.9$ for all the calculations [NZS3404 Table 3.4]

3. (#) next to Young's modulus $E$ indicates that its value is not 200000 MPa as per NZS3404 1.4.

--- Design Summary

Designation: ST UB530X92.4 (AISC sections)

Governing Load Case: 1*

Governing Criteria: Cl.

12.8.3.1.1

Governing Ratio: 14.910 *(fail)

Governing Location: 10.015 m from Start.

Section Properties

V.NZS3404 1997-Unequal Angle Section 
Verify the design capacity of an A125x75x8 section as per the NZS3404 1997 code.

Details 
Verify the section capacity of an A125x75x8 section used for a 5 m cantilever span. Steel grade = 320 MPa.

Validation 
Section Classification 
Evaluate the slenderness effects of the beam flanges: 

\[ \lambda_{ef} = \frac{B}{2t_f} \sqrt{\frac{f_y}{250}} = \frac{117.2}{7.8} \sqrt{\frac{320}{250}} = 17.0 \]

Section flange classification is compact.
Evaluate the slenderness effects of the beam web:

\[ \lambda_{ew} = \frac{d}{t_w} \sqrt{\frac{f_y}{250}} = \frac{67.2}{7.8} \sqrt{\frac{320}{250}} = 9.75 \]

Section web classification is compact 
Section Bending Capacity About Z-Axis 
Effective Section Modulus, \( Z_{ez} = 12,720 \, \text{mm}^3 \)

The nominal section capacity in bending about Z axis, \( M_{ez} = \phi f_y Z_{ez} \)

---

**STAAD.Pro**

4413  **User Manual**
\[ M_{sz} = 320 \times 12,720 \times 10^{-6} = 4.07 \text{ kN m} \]
\[ \phi M_{sz} = 0.9 \times 4.07 = 3.66 \text{ kN m} \]

**Section Bending Capacity About Y-Axis**

**Effective Section Modulus,** \[ Z_{ey} = 40,550 \text{ mm}^3 \]

The nominal section capacity in bending about Z axis, \[ M_{sy} = \phi f_y \times Z_{ey} \]
\[ M_{sy} = 320 \times 40,550 \times 10^{-6} = 12.98 \text{ kN m} \]
\[ \phi M_{sy} = 0.9 \times 12.98 = 11.68 \text{ kN m} \]

**Member Bending Capacity**

End restraint arrangement = FU

A twist restraint factor, \( K_t \) (SKT) = 1.00

Minor axis rotation restraints = Fu

Lateral rotation restraint factor, \( K_r \) (SKR) = 0.70

Load Height factor, \( K_l \) = 2.0 [Ref : Table 5.6.3(2)]

Effective length = 1\times1\times2\times5,000 = 10,000 mm
\[ \alpha_m = 1.25 \]

Reference buckling moment, \( M_o \)
\[ M_o = \frac{\pi^2 E I_y}{L_{e}^2} \left[ G J + \frac{\pi^2 E I_w}{L_{e}^2} \right] = 4.43 \text{ kN m} \]

\[ \alpha_s = 0.6 \left( \left( \frac{M_{sx}}{M_{oa}} \right)^2 + 3 \right) \left( \frac{M_{sx}}{M_{oa}} \right) = 0.284 \]  
[Ref : Clause 5.6.1.1 (c)]

\[ M_{bx} = \alpha_m \alpha_s M_{sx} \leq M_{sx} \]
\[ M_{bz} = 1.25 \times 0.284 \times 12.98 = 4.61 \text{ kN m} \leq (M_{sz}, M_{sy})_{\text{Max.}} \]  
[Ref : Clause 5.6.1.1.1(a)]

\[ \phi M_{bz} = 0.9 \times 4.61 = 4.15 \text{ kN m} \]

**Check for Shear**

Shear Area of the section, \( A_y = d \times t = 125 \times 7.8 = 975 \text{ mm}^2 \)

Section Shear Capacity (Along Y axis), \( V_y = 0.6 \times f_y \times A_y = 0.6 \times 320 \times 975 = 187 \text{ kN} \)
\[ V_{vn} = 2 \times 187/(0.9 + 1.2) = 178 \text{ kN} \]  
[Ref : Clause 5.11.2]

\[ \phi V_y = 0.9 \times 178 = 133.2 \text{ kN} \]

Shear Area of the section, \( A_z = b \times t = 75 \times 7.8 = 585 \text{ mm}^2 \)

Section Shear Capacity (Along z axis), \( V_z = 0.6 \times f_y \times A_z = 0.6 \times 320 \times 585 = 112.3 \text{ kN} \)
\[ V_{vn} = 2 \times 112.3/(0.9 + 1.2) = 107 \text{ kN} \]
\[ \phi V_z = 0.9 \times 107 = 96.3 \text{ kN} \]

**Check for Axial Compression**

Section Compression Capacity:

Gross Area, \( A_g = 1,500 \text{ mm}^2 \)
Net Area, \( A_n = 1,500 \, \text{mm}^2 \)
Form factor, \( K_f = A_e/A_g = 1.0 \)

The nominal member section capacity for axial compression,

\[ N_s = K_f \times A_n \times f_y = 1.0 \times 1,500 \times 320 = 480 \, \text{kN} \]  
\[ \phi N_s = 0.9 \times 480 = 432 \, \text{kN} \]  

**Member Compression Capacity**

Length of the member, \( L = 5,000 \, \text{mm} \)
Effective length factor for slenderness & buckling about minor Y-axis, \( K_y = 2.2 \)
Effective length factor for slenderness & buckling about minor Z-axis, \( K_z = 2.2 \)

Effective Length of member, \( L_{ez} = 2.2 \times 5,000 \, \text{mm} = 11,000 \, \text{mm} \)
Effective Length of member, \( L_{ey} = 2.2 \times 5,000 \, \text{mm} = 11,000 \, \text{mm} \)

\[ r_y = \sqrt{2.72 \times 10^6 / 1,500} = 42.6 \]
\[ r_z = \sqrt{398 \times 10^3 / 1,500} = 16.3 \]

Geometrical Slenderness Ratio \( = L_{ez}/r_z = 11,000 / 16.3 = 674.9 \)
Geometrical Slenderness Ratio \( = L_{ey}/r_y = 11,000 / 42.6 = 258.3 \)

Member slenderness,

\[ \lambda_{nz} = \frac{L_{ez}}{r_z} \sqrt{K_f} = \left( \frac{250}{250} \right)^{\frac{1}{2}} = 763.5 \]  
\[ \lambda_{ny} = \frac{L_{ey}}{r_y} \sqrt{K_f} = \left( \frac{250}{250} \right)^{\frac{1}{2}} = 291.9 \]  
\[ a_{az} = 2,100 \times (\lambda_{nz} - 13.5)/(\lambda_{nz}^2 - 15.3\lambda_{nz} + 2,050) = 2.747 \]
\[ a_{ay} = 2,100 \times (\lambda_{ny} - 13.5)/(\lambda_{ny}^2 - 15.3\lambda_{ny} + 2,050) = 7.061 \]
\[ a_b = 0.5 \]  
\[ \lambda_z = \lambda_{nz} + a_{az} \times a_z = 764.9 \]
\[ \lambda_y = \lambda_{ny} + a_{ay} \times a_b = 295.5 \]
\[ \eta = 2.45 \]
\[ \eta = 0.92 \]
\[ \xi_{az} = ((\lambda_{az}/90)^2 + 1 + \eta)/(2\times(\lambda_{az}/90)^2) = 0.52 \]
\[ \xi_{ay} = ((\lambda_{ay}/90)^2 + 1 + \eta)/(2\times(\lambda_{ay}/90)^2) = 0.59 \]
\[ a_{ez} = 0.013 \]
\[ a_{ey} = 0.085 \]

The nominal member capacity,

\[ N_{cz} = a_{ez} \times N_s = 0.013 \times 480 = 6.42 \, \text{kN} \]  
\[ \phi N_{cz} = 5.78 \, \text{kN} \]

The nominal member capacity,
\[ N_{cy} = \alpha_{cy} \times N_s = 0.085 \times 480 = 40.7 \text{kN} \]
\[ \phi N_{cy} = 36.66 \text{kN} \]

Nominal Section tension Capacity

[Ref: Clause 7.1]
\[ K_{te} = 1.00 \]
\[ N_{t1} = A_g \times f_y = 480 \text{kN} \]
\[ N_{t2} = 0.85 \times K_{te} \times A_n \times f_u = 516 \text{kN} \]
\[ \phi N_t = 0.9 \times 480 = 432 \text{kN} \]

### Design Notes

1. (*) next to a Load Case number signifies that a P-Delta analysis has not been performed for that particular Load Case; i.e. analysis does not include second-order effects.

2. ϕ = 0.9 for all the calculations [NZS3404 Table 3.4]

3. (#) next to Young's modulus $E$ indicates that its value is not 200000 MPa as per NZS3404 1.4.

### DESIGN SUMMARY

- **Designation:** ST A125X75X8 (AISC SECTIONS)
- **Governing Load Case:** 1*
- **Governing Criteria:** Cl. 5.1
- **Governing Ratio:** 2.425 *(FAIL)
- **Governing Location:** 0.000 m from Start.

V.SNiP SP16 2011 - I Section with Axial Load

Verify the design capacity of an I section used in a column per the SP16.13330.2011 code.

Details

The column is 7.5 m tall with a pinned base and a roller (free to move vertically and rotate) at the top. The column has a 3,500 kN axial load. The section used is an HD320X127. Steel grade is S235.

\[ E = 205,000 \text{ MPa} \]
\[ R_y = 235 \text{ MPa} \text{ (yield strength)} \]
\[ \gamma_{ct} = 1, \gamma_{c2} = 1 \]

Validation

Check for Axial Force

\[ \frac{N}{A \times R_y \times \gamma_c} \leq 1 \quad \text{[Cl. 7.1.1, Eqn. 5]} \]
\[ \frac{3,500}{161 \times 10^{-4} \times 235 \times 10^3 \times 1.0} = 0.925 \leq 1 \text{ (OK)} \]
\[ \frac{N}{\phi \times A \times R_y \times \gamma_c} \leq 1 \quad \text{[Cl. 7.1.3, Eqn. 7]} \]

where

\[ A = \text{ cross sectional area} = 161 \text{ cm}^2 \]

Slenderness ratios:

\[ K_y = K_x = 0.75 \]
\[ \lambda_x = \frac{K_x \cdot L}{r_x} = \frac{0.75 \times 7.5}{0.138} = 40.76 \]
\[ \lambda_y = \frac{K_y \cdot L}{r_y} = \frac{0.75 \times 7.5}{0.0757} = 74.3 \]
\[ \lambda_x = \lambda_x \sqrt{\frac{R_y}{E}} = 40.76 \sqrt{\frac{235}{205,000}} = 1.38 \]
\[ \lambda_y = \lambda_y \sqrt{\frac{R_y}{E}} = 74.3 \sqrt{\frac{235}{205,000}} = 2.516 \]
\[ \phi = 0.5 \cdot \sqrt{\frac{\lambda^2 \cdot \varpi^2 + 39.48 \times \lambda^2}{\lambda^2}} \quad \text{[Eqn. 8]} \]
\[ \varpi = 9.87 \times (1 - \alpha + \beta \times \lambda) + \lambda^2 \quad \text{[Eqn. 9]} \]

where

\[ \alpha = 0.04 \text{ (From Table 7)} \]
\[ \beta = 0.09 \text{ (From Table 7)} \]
\[ \lambda = 2.516 \text{ (maximum slenderness ratio)} \]
\[ \bar{\lambda} = 9.87 \times [1 - 0.04 + 0.09 \times (2.516)] + (2.516)^2 = 18.04 \]
\[ \phi = 0.5 \times \frac{(18.04)^2 + 39.48 \times (2.516)^2}{(2.516)^2} = 0.7385 < \frac{7.6}{\lambda^2} = 1.2006 \text{ (OK)} \]
\[ \frac{N}{\phi \times A \times R_y \times \gamma_c} = \frac{3,500}{0.7385 \times 0.0161 \times 235 \times 10^3 \times 1.0} = 1.25 > 1 \]

Check Web Slenderness
\[ h_{ef} = D - 4T_f = 320 - 4 \times 20.5 = 238 \text{ mm} \]
\[ \bar{\lambda}_w = \sqrt{\frac{238}{11.5 \sqrt{235 \times 205 \times 000}}} = 0.700 \]
\[ \lambda_{uw} = 1.2 + 0.35\lambda = 1.2 + 0.35(2.516) = 2.08 \text{ [Table 9; Eqn. 24]} \]
\[ \bar{\lambda}_w < \lambda_{uw} \text{ (OK)} \]

Check Flange Slenderness
\[ b_{ef} = \frac{1}{2} (B - 2T_w) = \frac{1}{2} (300 - 4 \times 11.5) = 127 \text{ mm} \]
\[ \bar{\lambda}_f = \sqrt{\frac{205 \times 235}{205 \times 000}} = 0.210 \]
\[ \lambda_{uf} = 0.36 + 0.1\lambda = 0.36 + 0.1(2.516) = 0.612 \text{ [Table 10; Eqn. 37]} \]
\[ \bar{\lambda}_f < \lambda_{uf} \text{ (OK)} \]

- D13.C.2 Member Capacities (on page 1885)

V.SNiP SP16 2011 - I Section with UDL
Verify the design capacity per SP16.13330.2011 of an I section subject to a uniformly distributed load.

Details
Uniformly distributed load of 100 kN/m along the entire span. Member is simply supported span 5m in length. Section used is an HD320x127.
Grade of Steel: S235 - $E = 206,000$ MPa, $f_y = 235$ MPa, $\gamma_{cl} = 1.1$, $\gamma_{c2} = 1.1$

Validation
Check for Flexure

$$\frac{M}{W_{n,min}R_y\gamma_c} \leq 1$$
[Eqn. 41 of SNIp SP16.13330.2011]

where

$$M = 312.5$$
$$W_{n,min} = W_x = 1,926.5 \text{ cm}^3$$
$$R_y = 235 \text{ MPa}$$
\[
\frac{M}{W_{n,\text{min}} R_y \gamma_c} = 0.628 \leq 1 \text{ (OK)}
\]

Check for Shear
\[
\frac{Q S}{I \cdot R_y \gamma_c} \leq 1 \quad \text{[Eqn. 42 of SNiP SP16.13330.2011]}
\]
where
\[
Q = q \cdot l / 2 = 250 \text{ kN}
\]
\[
S = 1,070 \text{ cm}^3
\]
\[
I = 30,820 \text{ cm}^4
\]
\[
R_y = 0.58 \times 235 \text{ MPa}
\]
\[
t_w = 11.5 \text{ mm}
\]
\[
\frac{Q S}{I \cdot R_y \gamma_c} = 0.5034 \leq 1 \text{ (OK)}
\]

Check for Lateral Torsional Buckling
\[
\frac{M_x \phi_b W_{cx} R_y \gamma_c}{\gamma_c} \leq 1 \quad \text{[Eqn. 43 of SNiP SP16.13330.2011]}
\]
where
\[
\alpha = 1.54 \frac{I_y}{I_x} \left( \frac{I_{ef}}{h} \right)^2 = 9.1603 \text{ [From Eqn. G.4]}
\]
\[
0.1 \leq \alpha \leq 40 \text{ so from Table G.1:}
\]
\[
\psi = 1.6 + 0.08\alpha = 2.333
\]
\[
\phi_1 = \psi \frac{I_y}{I_x} \left( \frac{h}{l_{ef}} \right)^2 \frac{E}{R_y} = 0.00078 < 0.85
\]

from Table G.3: \( \phi_b = 0.68 + 0.21\phi_1 = 1.2073 \geq 1.0 \) so use \( \phi_b = 1.0 \)
\[
\frac{M_x \phi_b W_{cx} R_y \gamma_c}{\gamma_c} = \frac{312.5}{1.0 \times 1926.5 \times 10^{-6} \times 235 \times 10^3 \times 1.1} = 0.628 \leq 1 \text{ (OK)}
\]

Check for Combined Shear & Flexure
\[
\frac{0.87 R_y \gamma_c \sqrt{\sigma_x^2 + \sigma_y^2 + 3 \tau_{xy}^2}}{\gamma_c} \leq 1 \quad \text{[Eqn. 44 of SNiP SP16.13330.2011]}
\]
where
\[
\sigma_x = \frac{M}{W_x} = 312.5 \times 10^2 / 1,926.5 = 162.2 \text{ MPa}
\]
\[
\sigma_y = 0 \text{ (No weak axis bending)}
\]
\[
\tau_{xy} = \frac{Q S}{(I \times t_w)} = 0 \text{ MPa}
\]

**Note:** Moment is maximum at mid-span, where shear is zero.
\[
\frac{0.87}{235 \times 1.1} \sqrt{162.2^2} = 0.55 \leq 1 \text{ (OK)}
\]

From Table 11 of SP16 code:
\[
\lambda_{ub} = 0.35 + 0.0032 \times b / t + (0.76-0.02 \times b / t) \times b / h = 0.35 + 0.0032 \times 300 / 20.5 + (0.76-0.02 \times 300 / 20.5) \times 1.0016 = 0.865
\]
\[
\lambda_b = \frac{I_{ef}}{b} \sqrt{\frac{R_y}{E}} = 0.5629
\]
\[ \lambda_b \leq \lambda_{ub}, \ OK \]

Check for Deflection

\[ f_{\text{max}} = \frac{5}{384} \frac{ql^4}{EI} = \frac{5}{384} \frac{100 \times 5^4}{206,000 \times 10^3 \times 30,820 \times 10^{-8}} = 0.0128 \text{ m} \]

Maximum member deflect = \( L/200 = 0.025 \text{ m} \)

Ratio = 0.0128 / 0.025 = 0.512

V. SNiP SP16 2017 - Channel section with UDL

Design an channel section subjected to a uniform distributed load per the SP 16.13330.2017 code.

Details

A 5m long, simply supported beam has an American C15X50 section. The beam is subjected to a uniform distributed load of 100 kN/m in the Y direction. The steel used has a modulus of elasticity of 206,000 MPa and a $R_{yn} = 235$ MPa, $\gamma_{c1} = 1.1$, $\gamma_{c2} = 1.1$

Validation

$R_y = R_{yn}/\gamma_m = 223.8$ MPa

$R_s = 0.58 \times R_y/\gamma_m = 129.8$ MPa

Check for Flexure

Need to satisfy the following equation:

$$\frac{M}{W_{n,\text{min}} R_y \gamma_c} \leq 1 \quad \text{(Eq. 41)}$$

where

$$\frac{M}{W_{n,\text{min}} R_y} = \frac{100 (5)^2}{8} = 312.5 \text{ kN} \text{m}$$

$$W_{n,\text{min}} = W_x = 883 \text{ cm}^3$$

Thus, the ratio is

$$\frac{312.5}{883(10)^{3/2} \times 235 \times 1.1} = 1.37 > 1$$
Check for Shear

Need to satisfy the following equation:

\[
\frac{QS}{I_w R_s y_c} \leq 1 \tag{Eq. 42}
\]

where

\[
Q = 0 \text{ kN}
\]

Thus, the ratio is \(0.0 < 1\)

Check for Combined Flexure & Shear

Need to satisfy the following equation:

\[
\frac{0.87}{R_y y_c} \sqrt{\sigma_x^2 - \sigma_x \sigma_y + \sigma_y^2 + 3 \tau_{xy}^2} \leq 1 \tag{Eq. 44}
\]

where

\[
\sigma_x = \frac{M}{W_x} = 312.5 \ (10^3) / 883 = 353.9 \text{ MPa}
\]

\[
\sigma_y = 0 \text{ MPa}
\]

\[
\tau_{xy} = 0 \text{ MPa}
\]

Thus, the ratio is \(\frac{0.87}{235 \times 1.1} \sqrt{(353.9)^2} = 1.19 > 1\)

Check for Stability

Check per Cl. 8.4.4. From Table 11 of SP 16.13330-2017:

\[
\bar{\lambda}_{ub} = 0.35 + 0.0032 \frac{b}{h} + \left(0.76 - 0.02 \frac{b}{h}\right) \frac{b}{h} \tag{Eq. 73}
\]

\[
\bar{\lambda}_{ub} = 0.35 + 0.0032 \frac{94.49}{16.51} + \left(0.76 - 0.02 \frac{94.49}{16.51}\right) \frac{0.2593}{16.51} = 0.536
\]

\[
\bar{\lambda}_b = \frac{l_{ef} b}{E} \frac{R_y}{E} = 1.787 > \bar{\lambda}_{ub}
\]

So, the stability of the beam is not ensured per Cl. 8.4.4.b. Therefore a check per Cl 8.4.1 needs to be made.

Check for Lateral-Torsional Buckling

Need to satisfy the following equation:

\[
\frac{M_x}{\phi_b W_{cx} R_y y_c} \leq 1 \tag{Eq. 69}
\]

\[
\alpha = 1.54 \frac{I_y}{I_x} \left(\frac{l_{ef}}{h}\right)^2 = 63.80 \tag{Eq. G.4}
\]

Since \(\alpha > 40\), from Table G.1:

\[
\psi = 3.15 + 0.04 \alpha - 2.7(10)^{-5} \alpha^2 = 5.592
\]

\[
\phi_1 = \frac{\psi}{I_y} \left(\frac{h}{l_{ef}}\right)^2 \frac{E}{R_y} = 0.775
\]

\[
\phi_b = 0.7 \phi_1 = 0.7(0.775) = 0.543
\]

Thus, the ratio is \(\frac{312.5}{0.543 \times 883(10)^{-3} \times 235 \times 1.1} = 2.52 > 1\)

Check for Deflection
\[ f_{\text{max}} = \frac{5}{384} q l^4 = \frac{5}{384} \frac{100 \times 5^4}{206(10)^6} = 0.0235 \text{ m} \]

The maximum member deflection is limited to \( l / 200 = 0.025 \text{ m} \)

Thus, the ratio is \( 0.0235 / 0.025 = 0.94 \)

V. SNiP SP16 2017 - CLASS 2 Rolled I Section with Bi-Moment

Verify a rolled I section subjected to uniform distributed loads per the SP 16.13330.2017 code.

Details

A 6m long, simply supported beam has a UPT HE500A section. The beam is subjected to a uniform distributed load of 132.2 kN/m in the Y direction and a bi-moment of 10 kN·. The steel used has a modulus of elasticity of 206,000 MPa and a $R_{yn} = 235$ MPa. $\gamma_m = 1.025$, $\gamma_c = 1$

Section Properties

- $D = 490$ mm
- $B = 300$ mm
- $t_f = 23$ mm
- $t_w = 12$ mm
- $I_x = 84,054$ cm$^4$
- $I_y = 10,356$ cm$^4$
- $W_x = 3,431$ cm$^3$
- $W_y = 690.4$ cm$^3$

Validation

- $R_y = R_{yn}/\gamma_m = 229.3$ MPa
- $R_s = 0.58\times R_y/\gamma_m = 133.0$ MPa
Check for Flexure

As this is a Class 2 section (elasto-plastic), it must satisfy equation 53 from Cl. 8.2.3:

\[
\frac{M_x}{c_x W_{x,\min} R_y} + \frac{B}{c_w W_{y,\min} R_y} \leq 1
\]  

(Eq. 53)

where

\[
M_x = \frac{132.2 (6)^2}{8} = 594.9 \text{ kN m}
\]

\[
\beta = 1 \text{ per Eq. 52 (Cl. 8.2.3), as } Q_x = Q_y = 0, \text{ and therefore } \tau_x = \tau_y = 0
\]

\[
c_x = 1.063 \text{ (from Table E.1); for } \frac{A_f}{A_w} = \frac{69}{53.28} = 1.295
\]

\[
c_w = 2.915 \text{ (from Table 10a)}
\]

Thus, the ratio is

\[
\frac{594.9 (10)^2}{1.063 (3,431/229.3)(1.0)} + \frac{10(10)^2}{2.915 (690.4/229.3)(1.0)} = 0.711 + 0.022 = 0.733
\]

Check for Stability

Check per Cl. 8.4.4. From Table 11 of SP 16.13330-2017:

\[
\sigma_x = \frac{M_x}{W_x R_y} = \frac{594.9}{3,431 \times (10)^{-3}} = 173.4 \text{ MPa}
\]

\[
\lambda_{ub} = \left[ 0.35 + 0.0032 \frac{b}{T} + \left( 0.76 - 0.02 \frac{b}{T} \right) \frac{b}{h} \right] \delta \sqrt{\frac{R_y}{\delta_x}}
\]

Per Cl. 8.4.6, this value is multiplied by \(\delta\) as indicated above, where:

\[
\delta = 1 - 0.6 \frac{(c_{lx} - 1)}{(c_x - 1)}
\]  

(Eq. 76)

where

\[
c_{lx} = \max \left| \frac{M_x}{W_{x, x}} \right| = \max \left| \frac{594.9 (10)^2}{3,431 (229.3)(1.0)} \right| = 0.756
\]

\[
\beta c_x = 1.0 \times 1.063 = 1.063
\]

Therefore, since \(c_{lx} = c_x \delta = 1 - 0.6 = 0.4\)

\[
\lambda_{ub} = \left[ 0.35 + 0.0032 \frac{300}{23} + \left( 0.76 - 0.02 \frac{300}{23} \right) \frac{300}{490} \right] 0.4 \sqrt{\frac{229.3}{173.4}} = 0.328
\]

\[
\lambda_b = \frac{\text{l}_{ef}^{\gamma}}{\gamma} \sqrt{\frac{R_y}{E}} \left[ \frac{\text{l}_{ef}^{\gamma}}{\gamma} \sqrt{\frac{R_y}{E}} \right] = 0.667 > \lambda_{ub}
\]

So, the stability of the beam is not ensured per Cl. 8.4.4.b.

Check for Deflection

\[
f_y = \frac{5}{384} \frac{q l^4}{E I_x} = \frac{5}{384} \frac{132 \times 4}{206(10)^6 84,054(10)^{-8}} = 0.0129 \text{ m}
\]

The maximum member deflection is limited to \(l / 200 = 0.03 \text{ m}\)

Thus, the ratio is \(0.0129 / 0.03 = 0.429\)

### V. SNiP SP16 2017 - CLASS 2 UPT I section

Check the capacity of a user-provided table I section subject to biaxial moment per the SP 16.13330.2017 code.

#### Details

A 6m, simply supported beam uses a welded, built-up I section. The section is defined as Class 2 (elasto-plastic). The flanges are 300 mm × 23 mm; the total section depth is 490 mm; the web thickness is 12 mm. The steel used has a modulus of elasticity of 206,000 MPa and a $R_{y,n} = 235$ MPa, $\gamma_m = 1.025$, $\gamma_c = 1.0$.

The member is subjected to uniformly distributed loads of 150 kN/m in the Y direction and 30 kN/m in the Z direction.

#### Validation

\[
R_y = R_{y,n}/\gamma_m = 229.3 \text{ MPa}
\]

\[
R_s = 0.58 \times R_y/\gamma_m = 133.0 \text{ MPa}
\]

#### Section Properties

\[
I_x = \frac{12(490 - 2 \times 23)^3}{12} + 2\left[\frac{300(23)^3}{12} + 300(23)(\frac{490 - 23}{2})^2\right] = 84,054 \text{ cm}^4
\]

\[
I_y = \frac{(490 - 2 \times 23)12^3}{12} + 2\left[\frac{23(300)^3}{12}\right] = 10,356 \text{ cm}^4
\]

\[
W_x = \frac{84,054(2)}{49} = 3,431 \text{ cm}^3
\]

\[
W_x = \frac{10,356(2)}{30} = 690.4 \text{ cm}^3
\]

Check for Flexure
Ratio of area of the flange to the area of the web:

\[ \frac{A_f}{A_w} = \frac{300 \times 23}{(490 - 2 \times 23)12} = 1.295 \]

Need to satisfy the following equation from Cl. 8.2.3:

\[ \frac{M_x}{c_x \beta W_{x,\min} R_y \gamma_c} + \frac{M_y}{c_y \beta W_{y,\min} R_y \gamma_c} \leq 1 \quad \text{(Eq. 51)} \]

where

\[
\begin{align*}
M_x &= 150 (6)^2 / 8 = 675 \text{ kN·m} \\
M_y &= 30 (6)^2 / 8 = 135 \text{ kN·m} \\
\beta &= 1 \text{ per Eq. 52, as } Q_x = Q_y = 0, \text{ and therefore } \tau_x = \tau_y = 0 \\
c_x &= 1.0611 \text{ (from Table E.1)} \\
c_y &= 1.47 > 1.15, \text{ thus use } 1.15
\end{align*}
\]

Thus, the ratio is

\[
\frac{675}{1.061 \times 1 \times 3, 431 \times (10)^{-3} \times 229.3 \times 1} + \frac{135}{1.15 \times 1 \times 690.4 \times (10)^{-3} \times 229.3 \times 1} = 1.55 > 1
\]

Check for Stability

\[
\phi_x = \frac{M_x}{W_c \gamma_c} = \frac{675}{3, 431 \times (10)^{-3} \times 1} = 196.7 \text{ MPa}
\]

\[
\lambda_{ub} = \left[ 0.35 + 0.0032 \frac{b}{t} + (0.76 - 0.02 \frac{b}{t}) \frac{b}{h} \right] \times \delta \sqrt{\frac{R_y}{\phi_x}} \quad \text{(Eq. 76)}
\]

Per Cl. 8.4.6, the value \( \lambda_{ub} \) is multiplied by \( \delta \).

\[
\delta = 1 - 0.6(\frac{c_{1x}}{1} - 1) = 0.858, \text{ or } \beta c_x = 1.061, \text{ so } \delta = 1.061
\]

\[
\lambda_{ub} = \left[ 0.35 + 0.0032 \frac{300}{23} + (0.76 - 0.02 \frac{300}{23}) \frac{300}{490 - 23} \right] \times 0.4 \sqrt{\frac{229.3}{196.7}} = 0.308 < \lambda_b
\]

So, the stability of the beam is not ensured per Cl. 8.4.4.b.

Check for Deflection

\[
\begin{align*}
f_y &= \frac{5}{384} \frac{q t^4}{E I_x} = \frac{5}{384} \frac{150 \times 4}{206(10)^684, 054(10)^8} = 0.0237 \text{ m} \\
f_z &= \frac{5}{384} \frac{q t^4}{E I_x} = \frac{5}{384} \frac{30 \times 4}{206(10)^610, 356(10)^8} = 0.0146 \text{ m} \\
f_{max} &= \sqrt{(0.0237)^2 + (0.0146)^2} = 0.0279 \text{ m}
\end{align*}
\]

The maximum member deflection is limited to \( l / 200 = 0.03 \text{ m} \)
Thus, the ratio is $0.0279 / 0.03 = 0.93$

V. SNiP SP16 2017 - Column in compression

Details

A 6.78 m tall, simply supported column has a Russian K2-30 section. The column is subject to a 1,500 kN axial load. The steel used has a modulus of elasticity of 206,000 MPa and a $R_y = 239$ MPa. $\gamma_{c1} = 1$, $\gamma_{c2} = 1$

Section Properties

- $D = 300$ mm
- $B = 300$ mm
- $t_t = 15$ mm
- $t_w = 10$ mm
- $A = 119.78$ cm$^2$
- $I_x = 20,410$ cm$^4$
- $I_y = 6,755$ cm$^4$
- $r_x = 13.05$ cm
- $r_y = 7.51$ cm
- $J = 76.5$ cm$^4$

Validation

Check for Axial Force

Need to satisfy the following equation per Cl. 7.1.1:

$$\frac{N}{A_n R_y \gamma_c} \leq 1$$  \hspace{1cm} (Eq. 5)

Thus, the ratio is

$$\frac{1,500}{119.78 \times 10^{-1} \times 239 \times 1} = 0.524 < 1$$
Check the slenderness per Cl. 10.4.1. Limit the slenderness to 120.

\[
\lambda_x = \frac{k_x l}{r_x} = \frac{1.0 \times 6.78}{0.1305} = 51.94 < 120
\]

\[
\lambda_y = \frac{k_y l}{r_y} = \frac{1.0 \times 6.78}{0.0751} = 90.28 < 120
\]

Thus, the ratio is \(90.28 / 120 = 0.75\)

Check Cl. 7.1.3

\[
\bar{\lambda}_x = \lambda_x \sqrt{\frac{R_y}{E}} = 51.94 \sqrt{\frac{239}{206,000}} = 1.769
\]

\[
\bar{\lambda}_y = \lambda_y \sqrt{\frac{R_y}{E}} = 90.28 \sqrt{\frac{239}{206,000}} = 3.075
\]

Therefore, \(\bar{\lambda} = 3.075\)

Need to satisfy the following equation:

\[
\frac{N}{\phi A R_y c} \leq 1
\]  
(Eq. 7)

where

\[
\phi = 0.5 \frac{\delta}{\lambda^2} - \sqrt{\frac{1}{\lambda^2} - 39.48 \times \lambda^2}, \text{ per Eq. 8}
\]

\[
\delta = 9.87(1 - \alpha + \beta \bar{\lambda}) + \bar{\lambda}^2, \text{ per Eq. 9}
\]

From Table 7, note 2, \(\alpha = 0.04\) and \(\beta = 0.14\).

\[
\delta = 9.87[1 - 0.04 + 0.14(3.075)] + (3.075)^2 = 23.18
\]

\[
\phi = 0.5 \frac{23.18 - \sqrt{(23.18)^2 - 39.48 \times (3.075)^2}}{(3.075)^2} = 0.549 < \frac{7.6}{\bar{\lambda}^2} = \frac{7.6}{(3.075)^2} = 0.804
\]

Thus, the ratio is \(\frac{1,500}{0.549 \times 119.78 \times 10^{-1} \times 239 \times 1} = 0.955 < 1\)

Check Cl. 7.3.2

Design height of the cross-section wall, \(h_{ef} = 240 \text{ mm} \) (Cl. 7.3.1)

\[
\bar{\lambda}_{w} = \frac{h_{ef}}{t_w} \sqrt{\frac{R_y}{E}} = \frac{240}{15} \sqrt{\frac{239}{206,000}} = 0.818
\]

Since \(\bar{\lambda} = 3.075 > 2, \bar{\lambda}_{uw} = 1.20 + 0.35 \bar{\lambda} = 2.276 < 2.3 \) (per F.(24), Table 9)

\(\bar{\lambda}_{w} < \bar{\lambda}_{uw}, \text{ OK}\)

Check Cl. 7.3.8

Design width of the cross-section wall, \(b_{ef} = b/2 - 2t_w = 130 \text{ mm}\)

\[
\bar{\lambda}_{f} = \frac{b_{ef}}{t_f} \sqrt{\frac{R_y}{E}} = \frac{130}{15} \sqrt{\frac{239}{206,000}} = 0.295
\]

Since \(\bar{\lambda} = 3.075 > 2, \bar{\lambda}_{uf} = 0.36 + 0.10 \bar{\lambda} = 0.668 \) (per F.(37), Table 10)
\[ \overline{\lambda}_f < \overline{\lambda}_{uf}, \text{ OK} \]

V. SNiP SP16 2017 - Eccentrically Compressed Tube Section

Design a column subject to axial compressive force and biaxial moment per the SP 16.13330.2017 code.

Details

A 5 m tall, simply supported column has a TUB200X160X8 section. The column is subject to a 80 kN axial load along with a uniformly distributed load of 30 kN/m in the local X axis. The steel used has a modulus of elasticity of 206,000 MPa and a $R_y = 562$ MPa. $\gamma_c = 1$, $\gamma_m = 1.05$

Section Properties

\[
\begin{align*}
D &= 200 \text{ mm} \\
B &= 160 \text{ mm} \\
t &= 8 \text{ mm} \\
A &= 52.84 \text{ cm}^2 \\
I_x &= 2,975 \text{ cm}^4 \\
I_y &= 2,110 \text{ cm}^4 \\
I_T &= 4,083 \text{ cm}^4 \\
r_x &= 7.50 \text{ cm} \\
r_y &= 6.32 \text{ cm}
\end{align*}
\]

Validation

\[
R_y = \frac{R_{yn}}{\gamma_m} = 561.9 \text{ MPa}
\]

\[
R_s = 0.58 \times R_y / \gamma_m = 325.9 \text{ MPa}
\]

Bending moment:

\[
M_x = q_x \times L^2 / 8 = 30 (5)^2 / 8 = 93.75 \text{ kN m}
\]

Design for Strength (Cl. 9.1.1)

\[
\sigma = \frac{N}{A_n} = \frac{80}{52.84(10)} = 14.54 < 0.1 R_y = 56.19
\]
\( R_{yn} \leq 440 \text{ N/mm}^2 \)

\( \tau = 0 \); i.e., \(< 0.5 \times R_s \)

So, as per Cl. 9.1.1, F.105 should not be checked. Rather F.106 needs to be checked.

\[
\frac{N}{A} \pm \frac{M_{xy}}{I_{xy}} \pm \frac{M_{yx}}{I_{yx}} \pm \frac{B_{w}}{I_{w}} \leq 1 \\
\]

where

\[
y = \frac{D}{2} = 100 \text{ mm} \\
B_{w} = 0
\]

\[
14.54 + \frac{93.75(100)}{2.975 \times 10^2} = 0.588 < 1
\]

Design for Stability (Cl. 9.2.2)

To satisfy F.109, \( m_{ef} \leq 20 \), where:

\[
m_{ef} = \eta \times m
\]

where

\[
e = \frac{M}{N} = 93.75 / 80 = 1.172 \text{ m} \\
m = e \times \frac{A}{W_c} = 1.172 \times 0.00055 / 0.000319 = 20.20
\]

Thus, \( m > 20 \), so must review Section 8 for further checks.

Design for Stability for a Box Section (Cl. 9.2.10)

Check the stability of box bars with constant cross-section subject to compression on one or two main planes:

\[
\frac{N}{\phi_{ey} \times A \times R_y \times \gamma_c} + \frac{M_x}{c_x \times \phi_x W_{x,\text{min}} \times R_y \times \gamma_c} \leq 1
\]

As per this clause, for uniaxial bending in the plane of maximum stiffness (i.e., \( I_x > I_y, M_y = 0 \)), \( \phi_{ey} \) should be replaced by \( \phi_y \).

\[
\lambda_x = K_x \times L / r_x = 1.0 (500) / 7.50 = 66.34 \quad \text{(Cl 10.4.1)} \\
\lambda_y = K_y \times L / r_y = 1.0 (500) / 6.32 = 79.12 \\
\lambda_x = \lambda_x \sqrt{\frac{R_y}{E}} = 66.64 \sqrt{\frac{561.9}{206,000}} = 3.480 \\
\lambda_y = \lambda_y \sqrt{\frac{R_y}{E}} = 79.12 \sqrt{\frac{561.9}{206,000}} = 4.132
\]

The conditional slenderness, \( \lambda \), is the larger of \( \lambda_x \) and \( \lambda_y \). Thus, \( \lambda = 4.132 \)

From Table 7, \( a = 0.03 \) and \( \beta = 0.06 \) for a tube cross-section.

\[
\delta = 9.87 (1 - a + \beta \times \lambda) + \lambda^2 = 9.87 (1 - 0.03 + 0.06 \times 4.132) + (4.132)^2 = 29.098 \\
\phi = 0.5 \frac{\delta - \sqrt{\delta^2 - 39.48 \times \lambda^2}}{\lambda^2} = 0.476
\]

"
Note that per Cl. 7.1.3, for section type a, the maximum value of \( \phi \) is given as \( \frac{7.6}{\lambda} = \frac{7.6}{(4.132)^2} = 0.445 \) for conventional flexibility greater than 3.8. Thus, take \( \phi = 0.445 \).

\[
c_x = 1.14
\]

\[
\delta_x = 1 + \frac{0.1N \times \bar{x}^2}{A \times R_y} = 1 + \frac{0.1 \times 80 \times (3.480)^2(10)}{52.84 \times 561.9} = 1.033
\]

So the ratio for stability about x axis is:

\[
\frac{80(10)^1}{0.445(52.84 \times 561.9)(1.0)} + \frac{93.75(10)^3}{1.14(1.03)(297.5)(561.9)(1.0)} = 0.061 + 0.478 = 0.537
\]

Check for Flexure

\[
\frac{M}{W_{n,min}R_y\gamma_c} \leq 1
\]

where

\[
W_{n,min} = \frac{93.75}{297.5(10)^6 \times 561.9 \times 1.0} = 0.561 \leq 1 \text{ (OK)}
\]

Check for Shear

By inspection, the shear at the maximum moment location is zero under a uniformly distributed load.

\[
\frac{Q_S}{T_w R_y \gamma_c} \leq 1
\]

where

\[
Q = q.l/2 = 0 \text{ kN}
\]

\[
\frac{Q_S}{T_w R_y \gamma_c} = 0 \leq 1 \text{ (OK)}
\]

Check for Combined Shear & Flexure

\[
\frac{0.87}{R_y \gamma_c} \sqrt{\sigma_x^2 - \sigma_x \sigma_y + \sigma_y^2 + 3\tau_{xy}^2} \leq 1
\]

where

\[
\sigma_x = \frac{M}{W_x} = 93.75 \times 10^3 / 297.5 = 315.1 \text{ MPa}
\]

\[
\sigma_y = 0 \text{ (No weak axis bending)}
\]

\[
\tau_{xy} = \frac{Q_S}{(I \times t_w)} = 0 \text{ MPa}
\]

\[
\frac{0.87}{561.9 \times 1.0} \sqrt{315.1^2} = 0.488 \leq 1 \text{ (OK)}
\]

V. SNiP SP16 2017 - Interaction check of a column

Design a column per the SP 16.13330.2017 code.

Details

A 6.78m tall, simply supported column has a European HE600B section. The column is subject to a 310 kN axial load along with a uniformly distributed load of 50 kN/m in the local Y axis. The steel used has a modulus of elasticity of 206,000 MPa and a $R_y = 239$ MPa. $\gamma_c = I$, $\gamma_m = 1.05$

Validation

$R_y = R_{yn}/\gamma_m = 223.8$ MPa

$R_s = 0.58 \times R_y/\gamma_m = 129.8$ MPa

Shear force at support:

$Q = q_x \times L / 2 = 171.8$ kN

$M_x = q_x \times L^2 / 8 = 295.0$ kN m

Bending moment:

$M_x = q_x \times L^2 / 8 = 171.8 (6.78)^2 / 8 = 295.0$ kN m

Design for Strength (Cl. 9.1.1)

$\sigma = \frac{N}{A_n} = \frac{310}{270(10)^{1/2}} = 11.48 < 0.1 R_y = 22.38$

$R_{yn} \leq 440$ N/mm$^2$

$\tau = 0$; i.e., $> 0.5 \times R_s$

So, as per Cl. 9.1.1, F.105 should not be checked. Rather F.106 needs to be checked.
\[ m_{ef} = \eta \times m \]

where

\[ m = \frac{e \times A}{W_c} = 4.51 \quad (e = M/N = 0.9516) \]

\[ \lambda_x = \frac{k_x L_x}{r_x} = \frac{1.0 \times 6.87}{0.2517} = 27.3 \]

\[ \lambda_y = \frac{k_y L_y}{r_y} = \frac{1.0 \times 6.87}{0.0708} = 97.0 \]

\[ \bar{\lambda}_x = \lambda_x \sqrt{\frac{R_y}{E}} = 27.3 \sqrt{\frac{223.8}{206,000}} = 0.900 \]

\[ \bar{\lambda}_y = \lambda_y \sqrt{\frac{R_y}{E}} = 97.0 \sqrt{\frac{223.8}{206,000}} = 3.198 \]

Therefore, \[ \bar{\lambda} = min (\bar{\lambda}_x, \bar{\lambda}_y) = 0.900 \]

\[ \eta = (1.90 - 0.1m) - 0.02(6 - m) \bar{\lambda} = (1.90 - 0.1 \times 4.51) - 0.02(6 - 4.51)0.900 = 1.422 \]

So, \[ m_{ef} = 1.422 \times 4.51 = 6.41 < 20 \quad [\text{As per F.(110)}] \]

So, \[ A_f / A_w = 90 / 90 = 1 \]

\[ \frac{N}{A_n} \pm \frac{M_{x,y} x}{I_{x,n}} \pm \frac{M_{y,x} y}{I_{y,n}} \pm \frac{B_{\omega} \omega}{R_y \gamma_c} \leq 1 \quad (\text{F.(106))} \]

where

\[ x = 150 \text{ mm} \]
\[ y = 300 \text{ mm} \]
\[ B_{\omega} = 0 \]

\[ 11.48 + \frac{295.0(300)}{223.8 \times 1 \times 10^{-2}} = 0.28 < 1 \]

**Design for Stability (Cl. 9.2.2)**

From Table E.3, depending on conditional slenderness and reduced relative eccentricity:

\[ \phi_e = 0.2144 \]

\[ \frac{N}{\phi_e} \times A \times R_y \times \gamma_c = \frac{310}{0.2144 \times 270(10)^{-1} \times 223.8 \times 1} = 0.24 < 1 \quad (\text{F.(109))} \]

**Design for Stability (Cl. 9.2.4)**

Calculate the stability of eccentrically compressed elements of constant cross-section, out-of-plane bending moment in the plan of maximum stiffness \((I_x > I_y)\), coinciding with the plane of symmetry:

\[ \frac{N}{c \times \phi_y \times A \times R_y \times \gamma_c} \leq 1 \quad (\text{F.(111))} \]

where

\[ \phi_y = \frac{0.5(6 - \sqrt{6^2 - 39.483^2})}{\bar{\lambda}^2} \]
\[ \bar{\lambda} = \text{conditional slenderness} = \max (\bar{\lambda}_x, \bar{\lambda}_y) = 3.198 \]
\[ \delta = 9.87(1 - \alpha + \beta \lambda) + \lambda^2, \text{ per Eq. 9} \]

From Table 7, \( \alpha = 0.03 \) and \( \beta = 0.06 \).

\[ \delta = 9.87[1 - 0.03 + 0.06(3.198)] + (3.198)^2 = 21.70 \]

\[ \phi_y = 0.5 \frac{21.70 - \sqrt{(21.70)^2 - 39.48 \times (3.198)^2}}{(3.198)^2} = 0.660 \]

\[ c = \frac{\beta}{1 + \alpha \times m_x} \]

where

\[ \alpha = 0.65 + 0.05 \times m_x = 0.875 \]

\[ \lambda_y = 3.14 \]

\[ \delta_c = 9.87[1 - 0.03 + 0.06(3.14)] + (3.14)^2 = 21.29 \]

\[ \phi_c = 0.5 \frac{21.29 - \sqrt{(21.29)^2 - 39.48 \times (3.14)^2}}{(3.14)^2} = 0.674 \]

\[ \beta = \sqrt{\frac{\phi_c}{\phi_y}} = \sqrt{\frac{0.674}{0.661}} = 1.009 \]

Therefore, \( c = \frac{1.009}{1 + 0.875 \times 4.31} = 0.204 < 1 \)

So, the ratio is \( \frac{310}{0.204 \times 0.66 \times 270(10)^{-1} \times 223.9 \times 1} = 0.38 < 1 \)

Calculate \( C_{\text{max}} \) per Annex E.1

\[ c_{\text{max}} = \frac{2}{1 + \delta \beta + \sqrt{(1 + \delta \beta)^2 + \frac{16}{\mu} a - e_x h_c^2}} \]

where

\[ \delta = \frac{4 \times \rho}{\mu} \]

\[ \rho = \frac{I_x + I_y}{Ah^2} + a^2 \]

\[ \mu = 8\omega + \frac{0.156 \times I_y}{Ah^2} \]

\[ \omega = \frac{I_x}{I_y h_c^2} = \frac{\frac{h_c^2 \times b^3 \times t_f}{24}}{\frac{1}{3} h_c^2} = \frac{b^3 \times t_f}{24} = \frac{(30 \text{ cm})^3 \times 3 \text{ cm}}{24 \times 13 = 530 \text{ cm}^4} = 0.249 \]

\[ I_t = \frac{k}{3} \sum b_i t_i^3 = \frac{1.29}{3} [2(30 \text{ cm})(3 \text{ cm})^3 + (60 \text{ cm} - 2 \times 3 \text{ cm})(1.55 \text{ cm})^3] = 783.1 \text{ cm}^4 \]

\[ e_x = M / N = 295 / 310 = 0.952 \]

\[ B = 1 + 2(\beta / \rho)(e_x / h_c) = 1 \]

As per Table E.6, \( a = 0, \beta = 0 \)

\[ \mu = 8(0.249) + \frac{0.156 \times (783.1)(97.0)^2}{270 \times (60)^2} = 3.17 \]

\[ \rho = \frac{171,000 + 13,530}{270 \times 60^2} + 0 = 0.190 \]
\[ \delta = \frac{4 \times 0.19}{3.17} = 0.24 \]
\[ c_{\text{max}} = \frac{2}{1 + 0.24(0) + \sqrt{(1 + 0.24 \times 0)^2 + \left(\frac{16}{3.17} - 0.24\frac{0.6}{0.6}\right)^2}} = 0.43 \]

### V. SNiP SP16 2017 - I section with biaxial moment

Design an I section subjected to uniform distributed loads in both major and minor axes per the SP 16.13330.2017 code.

**Details**

A 6m long, simply supported beam has an European HE500A section. The beam is subjected to a uniform distributed load of 132.2 kN/m in the Y direction and 30 kN/m in the Z direction. The steel used has a modulus of elasticity of 206,000 MPa and a \( R_{yn} = 235 \text{ MPa} \), \( \gamma_m = 1.05 \), \( \gamma_c = 1 \)

**Validation**

\[
R_y = \frac{R_{yn}}{\gamma_m} = 223.8 \text{ MPa}
\]

\[
R_s = 0.58*R_y/\gamma_m = 129.8 \text{ MPa}
\]

**Check for Flexure**

Need to satisfy the following equation from Cl. 8.2.1:

\[
\frac{M_x}{I_{xn}R_y'\gamma_c} y^2 + \frac{M_y}{I_{yn}R_y'\gamma_c} s^2 + \frac{B_o}{I_{on}R_y'\gamma_c} \leq 1 \quad \text{(Eq. 43)}
\]

where

\[
M_x = 132.2 (6)^2 / 8 = 594.9 \text{ kN m}
\]

\[
M_y = 30 (6)^2 / 8 = 135 \text{ kN m}
\]

\[
B_x = 0
\]

Thus, the ratio is

\[
\frac{M_x}{I_{xn}R_y'\gamma_c} y^2 + \frac{M_y}{I_{yn}R_y'\gamma_c} s^2 + \frac{B_o}{I_{on}R_y'\gamma_c} = 1.62 > 1
\]

**Check for Shear**
Need to satisfy the following equation:

\[
\frac{QS}{T_w R_{sy/c}} \leq 1 \quad \text{(Eq. 42)}
\]

where

\[
Q = 0 \text{ kN}
\]

Thus, the ratio is \(0.0 < 1\)

Check for Combined Flexure & Shear

Need to satisfy the following equation:

\[
\frac{0.87}{R_{y/c}} \sqrt{\sigma_x^2 - \sigma_x \sigma_y + \sigma_y^2 + 3\tau_{xy}^2} \leq 1 \quad \text{(Eq. 44)}
\]

where

\[
\sigma_x = \frac{M_x}{W_x} = \frac{594.9 (10)^2}{3,550} = 167.6 \text{ MPa}
\]

\[
\sigma_y = \frac{M_y}{W_y} = \frac{135 (10)^2}{691.1} = 195.3 \text{ MPa}
\]

\[
\tau_{xy} = 0 \text{ MPa}
\]

Thus, the ratio is \(0.87 \times \frac{167.6}{1.223} \times 1.71 < 1\)

Check for Stability

Check per Cl. 8.4.4. From Table 11 of SP 16.13330-2017:

\[
\phi_x = \frac{M_x}{W_x \gamma_c} = \frac{594.9}{3,550 \times (10)^{-3} \times 1} = 167.6 \text{ MPa}
\]

\[
\lambda_{ub} = \left[ 0.35 + 0.0032 \frac{b}{t} + (0.76 - 0.02 \frac{b}{t}) \right] \frac{R_y}{\phi_x} = 0.823
\]

\[
\lambda_b = \frac{l_{ef}}{b} \sqrt{\frac{R_y}{E} \frac{6}{0.3 \sqrt{235}} = 0.659 < \lambda_{ub}}
\]

So, the stability of the beam is ensured per Cl. 8.4.4.b. Check per Cl 8.4.1 is not required.

Check for Deflection

\[
f_y = \frac{5}{384} \frac{q l^4}{E I_x} = \frac{5}{384} \frac{132 \times 6^4}{206(10)^6 \times 86,970(10)^{-8}} = 0.0124 \text{ m}
\]

\[
f_z = \frac{5}{384} \frac{q l^4}{E I_x} = \frac{5}{384} \frac{30 \times 6^4}{206(10)^6 \times 101, 356(10)^{-8}} = 0.0237 \text{ m}
\]

\[
f_{\max} = \sqrt{(0.0124)^2 + (0.0237)^2} = 0.0267 \text{ m}
\]

The maximum member deflection is limited to \(l / 200 = 0.03 \text{ m}\)

Thus, the ratio is \(0.0267 / 0.03 = 0.89\)

V. SNiP SP16 2017 - I section with UDL

Design an I section subjected to a uniform distributed load per the SP 16.13330.2017 code.

Details
A 5m long, simply supported beam has a European HD320X127 section. The beam is subjected to a uniform distributed load of 100 kN/m in the Y direction. The steel used has a modulus of elasticity of 206,000 MPa and a $R_{yn} = 235$ MPa, $\gamma_{c1} = 1.1$, $\gamma_{c2} = 1.1$.

Validation

$R_{y} = R_{yn}/\gamma_{m} = 223.8$ MPa

$R_{s} = 0.58 \times R_{y}/\gamma_{m} = 129.8$ MPa

Check for Flexure

Need to satisfy the following equation:

$$\frac{M}{W_{n,\text{min}}R_{y}^{\gamma_{c}}} \leq 1$$

(Eq. 41)

where

$$M = 100 (5)^{2} / 8 = 312.5 \text{ kN} \cdot \text{m}$$

Thus, the ratio is

$$\frac{312.5}{1.9265 \times 235(10)^{3} \times 1.1} = 0.63 < 1$$

Check for Shear

Need to satisfy the following equation:

$$\frac{Q_{S}}{T_{w}R_{y}^{\gamma_{c}}} \leq 1$$

(Eq. 42)
where \( Q = 0 \, \text{kN} \)

Thus, the ratio is \( 0.0 < 1 \)

**Check for Stability**

\[
\psi = \frac{M_x}{W_c \times r_c} = \frac{312.5}{1,926.5 \times (10)^{-3} \times 1.1} = 147.5 \, \text{MPa}
\]

\[
\bar{X}_{ub} = \left [ 0.35 + 0.0032 \frac{b}{t} + \left ( 0.76 - 0.02 \frac{h}{t} \right ) \frac{b}{h} \right ] R_y \phi_x
\]

\[
\bar{X}_{ub} = \left [ 0.35 + 0.0032 \frac{300}{20.3} + \left ( 0.76 - 0.02 \frac{300}{20.3} \right ) \frac{300}{320} \right ] \sqrt{\frac{235}{147.5}} = 1.054
\]

\[
\bar{X}_b = \frac{l_{ef}}{b} \sqrt{\frac{R_y}{0.3}} \sqrt{\frac{235}{206,000}} = 1.126 > \bar{X}_{ub}
\]

So, the stability of the beam is not ensured per Cl. 8.4.4.b. Check per Cl 8.4.1 needs to be performed.

**Check for Lateral-Torsional Buckling**

Use an effective length of 10 m.

Need to satisfy the following equation:

\[
\alpha = 1.54 \frac{l_{ef}}{l} \left ( \frac{l_{ef}}{h} \right )^2 = 1.54 \times \frac{2.25}{0.32} = 36.64
\]

Since \( 0.1 < \alpha < 40 \) from Table G.1:

\[
\psi = 1.6 + 0.08\alpha = 4.531
\]

\[
\phi_1 = \psi \frac{I_y}{I_{x}} \left ( \frac{h}{l_{ef}} \right )^2 \frac{E}{R_y} = 1.219
\]

\[
\phi_b = 0.68 + 0.21\phi_1 = 0.68 + 0.21(1.219) = 0.936
\]

Thus, the ratio is \( \frac{312.5}{0.936 \times 1.926.5(10)^{-3} \times 235 \times 1.1} = 0.67 < 1 \)

**Check for Combined Flexure & Shear**

Need to satisfy the following equation:

\[
\frac{0.87}{R_y \gamma_c} \sqrt{\sigma_x^2 - \sigma_x \sigma_y + \sigma_y^2 + 3 \tau_{xy}^2} \leq 1
\]

where

\[
\sigma_x = \frac{M_x}{W_x} = \frac{312.5 \times (10)^3}{1,926.5} = 162.2 \, \text{MPa}
\]

\[
\sigma_y = \frac{M_y}{W_y} = 0 \, \text{MPa}
\]

\[
\tau_{xy} = 0 \, \text{MPa}
\]

Thus, the ratio is \( \frac{0.87}{235 \times 1.1} \sqrt{(162.2)^2} = 0.55 < 1 \)

**Check for Deflection**
The maximum member deflection is limited to \( l / 200 = 0.025 \text{ m} \)
Thus, the ratio is \( 0.0128 / 0.025 = 0.51 \)

V. SNiP SP16 2017 - I section with axial force and Bi-moment

Design a column subject to axial compressive force and biaxial moment per the SP 16.13330.2017 code.

Details

A 5 m tall, simply supported column has an HE650A section. The column is subject to a 80 kN axial load along with a uniformly distributed load of 30 kN/m in the local X axis and a uniformly distributed load of 2 kN/m in the local Y axis. The steel used has a modulus of elasticity of 206,000 MPa and a $R_y = 235$ MPa. $\gamma_c = 1$, $\gamma_m = 1.05$

Section Properties

\[
\begin{align*}
D &= 640 \text{ mm} \\
B &= 300 \text{ mm} \\
t_f &= 26 \text{ mm} \\
t_w &= 13.5 \text{ mm}
\end{align*}
\]
\[ A = 241.6 \text{ cm}^2 \]
\[ I_x = 175,200 \text{ cm}^4 \]
\[ I_y = 11,720 \text{ cm}^4 \]
\[ I_T = 458 \text{ cm}^4 \]
\[ r_x = 26.93 \text{ cm} \]
\[ r_y = 6.97 \text{ cm} \]

**Validation**

\[ R_y = \frac{R_{yn}}{\gamma_m} = 223.8 \text{ MPa} \]
\[ R_s = 0.58 \times \frac{R_y}{\gamma_m} = 129.8 \text{ MPa} \]

Shear force at support:

\[ Q_x = q_x \times L / 2 = 75 \text{ kN} \]

Bending moment:

\[ M_x = q_x \times L^2 / 8 = 30 (5)^2 / 8 = 93.75 \text{ kN m} \]
\[ M_y = q_y \times L^2 / 8 = 2 (5)^2 / 8 = 6.25 \text{ kN m} \]

**Design for Strength (Cl. 9.1.1)**

\[ \sigma = \frac{N}{A_n} = \frac{80}{241.6(10)^2} = 3.311 < 0.1 R_y = 22.38 \]

\[ R_{yn} \leq 440 \text{ N/mm}^2 \]
\[ \tau = 0; \text{ i.e.,} < 0.5 \times R_s \]

So, as per Cl. 9.1.1, F.105 should not be checked. Rather F.106 needs to be checked.

\[ m_{ef} = \eta \times m \]

where

\[ m = e \times A / W_c = 5.172 \text{ (} e = M / N = 93.75 / 80 = 1.172 \text{)} \]

\[ \lambda_x = \frac{k_x \times l}{r_x} = \frac{1.0 \times 500}{26.93} = 18.57 \]
\[ \lambda_y = \frac{k_y \times l}{r_y} = \frac{1.0 \times 500}{6.97} = 71.74 \]

\[ \lambda_x = \lambda_x \sqrt{\frac{R_y}{E}} = 18.58 \sqrt{\frac{223.8}{206,000}} = 0.612 \]
\[ \lambda_y = \lambda_y \sqrt{\frac{R_y}{E}} = 71.74 \sqrt{\frac{223.8}{206,000}} = 2.364 \]

Therefore, \( \lambda = \min (\lambda_x, \lambda_y) = 0.612 \)

Evaluate \( \eta \), the coefficient of the shape of cross section vertical element when \( 5 < m \leq 20, A_f / A_w \geq 1 \), and \( 0 \leq \lambda \leq 5 \):

\[ \eta = 1.4 - 0.02 \lambda = (1.4 - 0.02 \times 0.612) = 1.388 \] (Table D.2, Note 1)
So, \( m_{ef} = 1.388 \times 5.172 = 7.18 < 20 \) [As per F.(110)]

\[
\frac{N}{A_n} \pm \frac{M_x}{I_{nx}} \pm \frac{M_y}{I_{ny}} \pm \frac{B_{\omega}}{I_{\omega n}} \leq 1
\]

where

\[
x = 150 \text{ mm}
\]

\[
y = 320 \text{ mm}
\]

\[
B_{\omega} = 0
\]

So, the ratio is

\[
3.311 + \frac{93.75(320)}{175,200 \times 10^{-2}} + \frac{6.25(150)}{11,720 \times 10^{-2}} = 0.127 < 1
\]
\[ \phi_1 = \frac{I_y}{I_x} \left( \frac{h}{I_{ef}} \right)^2 \frac{E}{R_y} = 2.507 \left( \frac{11,720}{175,200} \right)^2 \left( \frac{640}{5,000} \right) = 2.529 \]

\[ \phi_b = 0.68 + 0.21 \times \phi_1 = 1.211 > 1.0, \text{ take } \phi_b = 1.0 \]

Therefore, \( c_{max} = 0.175(2 - 0.2 \times 5.172) + 0.190(0.2 \times 5.172 - 1) = 0.176 \)

So, the ratio is \( \frac{0.176 \times 0.826 \times 242(10)^{-1} \times 223.9 \times 1}{0.198 \times 242(10)^{-1} \times 223.9 \times 1} = 0.102 < 1 \)

**Design for Stability (Cl. 9.2.9)**

\[ \frac{N}{\phi_{exy} \times A \times R_y \times \gamma_c} \leq 1 \]  \( \text{(F.111)} \)

where

\[ \phi_{exy} = 0.333 \text{ (per Table A.3)} \]

\[ \phi_{exy} = \phi_{ey} \left( 0.6 \phi_1 + 0.4 \phi_b \right) = 0.333 \left( 0.6 \phi_1 + 0.4 \phi_b \right) = 0.198 \]

So, the ratio is \( \frac{0.198 \times 242(10)^{-1} \times 223.9 \times 1}{0.198 \times 242(10)^{-1} \times 223.9 \times 1} = 0.075 < 1 \)

**V.I Section in Bending**

Determine the capacity of a South African I-section beam in bending per South African steel design code (SANS10162-1:1993). The beam has torsional and simple lateral rotational restraint at the supports, and the applied point load provides effective lateral restraint at the point of application is braced at its ends for both axes.

V. BS5950 2000 - Fully Restrained Simply Supported Beam

A 6.5 m, simply-supported beam is fully restrained along its length. The beam is designed in S275 steel for the loading described.

Reference

Related Links

- D3.B.5 Member Capacities (on page 1375)

Problem

The beam is designed in S275 steel for the loading described.

Dead Loads, $\gamma_{fd} = 1.4$:
- Distributed load (including s/w) $w_d = 15 \text{kN/m}$
- Point Load $W_d = 40 \text{kN}$

Imposed Loads, $\gamma_{fi} = 1.6$:
- Distributed load $W_i = 30 \text{kN/m}$
- Point Load $W_i = 50 \text{kN}$

- *D3.B.5 Member Capacities* (on page 1375)

Problem

Intermediate point loads are applied to the bottom flange. These do not provide restraint against lateral-torsional buckling. The beam is designed in S275 steel.
Dead Loads, $\gamma_{fd} = 1.4$:
- Selfweight $w_s = 3 \text{kN/m}$
- Point Load $W_{1d} = 40 \text{kN}$
- Point Load $W_{2d} = 20 \text{kN}$

Imposed Loads, $\gamma_{fi} = 1.6$:
- Point Load $W_{1i} = 60 \text{kN}$
- Point Load $W_{2i} = 30 \text{kN}$

LTB Moment Capacity (kNm) and LTB Length (m):   577.91,    6.000
LTB Coefficients & Associated Moments (kNm):
mLT =   1.00 :   mx =   0.00 :  my =   0.00 :   myx =   0.00
Mlt =    0.00 :   Mx =    0.00  :   My =   0.00   :   My =   0.00
V. BS5950 2000 - Pinned Column Using Non-Slender RHS

A 6.0m rectangular hollow section (RHS) column is pin ended about both axes and has no intermediate restraints.

Reference

- D3.B.5 Member Capacities (on page 1375)

Problem

The column is designed in S355 steel for the factored loading.

Point load, $F_c = 2,500 \text{ kN}$

Comparison

Table 697: Comparison of results

<table>
